Under the Agricultural Instruction Act, large appropriations are annually paid by the Dominion Government to each of the Provincial Governments of Canada for the encouragement of agriculture "through education, instruction and demonstration carried on along lines well devised and of a continuous nature," and "for the purposes of assisting in the work of veterinary colleges established in the provinces."

Dominion Experimental Farms and Stations have been established throughout Canada, 24 in number, divided among the provinces as follows: Three in Ontario, one in Prince Edward Island, two in Nova Scotia, one in New Brunswick, six in Quebec, two in Manitoba, three in Saskatchewan, two in Alberta, and four in British Columbia. In addition, there have been established eight sub-stations in Western Canada, and experimental work has been carried on, on fourteen farms in Saskatchewan, thirteen in Alberta, and thirteen in Quebec, under the supervision of the Dominion Government authorities.

Under the Canada Grain Act, 1912, the Dominion Government has power itself to erect and operate terminal grain elevators. Five such elevators are already in operation, situated at Port Arthur, Saskatoon, Moosejaw, Calgary and Vancouver. In addition to the expenditures of the Dominion Government, all the Provincial Governments spend large sums annually on agricultural development.

In every province legislation has been enacted to enable the farmer to buy his farm, buy farm implements, seed grain, and erect new buildings, without having any considerable sum of capital.

Of recent years the money appropriated for railway extension has been spent almost entirely with the intention of providing better facilities for the agricultural communities, and possibly no commodity carried by the railways of Canada enjoys a better rate than farm grains.

All these measures are sound, and consistent with the doctrine of protection, because they are designed to stimulate and safeguard the great basic industry of agriculture.

Replies to Free Trade Arguments

Objection may be taken to this general statement in support of protection and in opposition to free trade, on the ground that there are comparatively few free traders in Canada, and that free trade is not a practical issue. There are, no doubt, many who advocate free trade when they are in some parts of the country, and who say that they do not want to abolish the tariff entirely when they are in other parts of the country. But the fiscal policy of Canada must be governed either by the policy of protection or the policy of free trade. There is no middle ground, because these opposite policies cannot be reconciled. Moreover, one thing is clear. Free trade arguments are being used to-day as the spear head of the attack against the protective system in Canada. It may be that many who use the free trade arguments do not believe in them, and are merely trying to create a diversion from which they may profit. But, since these free trade arguments are being used to attack the National Policy, it is necessary to show why they cannot be applied profitably to Canada.

One of the chief free trade arguments is to belittle the

value of the home market, especially to farmers. It is stated that Canadian farmers sell their produce in an open market, where the prices are fixed by international competition, and that they buy what they need in Canada, which is described as a closed market. For 1919 the gross value of the agricultural production of Canada has been officially estimated at $1,975,841,000. Exports of unmanufactured farm produce were valued at approximately $315,000,000, or, if butter and cheese be included, at a little over $361,000,000. In other words only between 16 and 18.5 per cent. of all the produce of Canadian farms was exported in the unmanufactured state, while between 81.5 and 84 per cent. was marketed in Canada.

The home market under normal conditions is a constant market. In a country where the population is steadily increasing it is a growing market. The foreign market or open market is an uncertain market. It may be lost entirely through war. It may be restricted through unfriendly legislation or economic causes.

During the present war, thanks to British supremacy on the seas, the foreign market was greatly enlarged for Canadian agriculture. Europe wanted everything Canada could grow, but if the supremacy of the seas had been in the hands of the enemy, the market for Canadian farm produce in Europe would have disappeared. As a matter of fact, the market for Australian and New Zealand farm produce was greatly diminished, owing to the scarcity of ships to carry produce from New Zealand and Australia to Europe. When shipping was scarce, Canada got the preference because ships could be sent more quickly and safely to Canada than to New Zealand and Australia.

Another example of the destruction of markets by war conditions is afforded by Russia. When the Germans and Turks closed the Dardanelles, Russian wheat stopped coming to the Allies.

An example of the home market being lost by legislation occurred in Canada when the United States advanced the duty on Canadian barley, with the result that the price of barley in Canada dropped over night 20 cents to 30 cents per bushel.

Another example of tariff legislation was shown by Germany when she put an extra tax on Canadian wheat. Foreign nations have absolute control of their own tariffs; they can exclude Canadian produce at any time; and examples are numerous of such action having been taken unexpectedly and arbitrarily.

Foreign markets may be lost or restricted through gradual economic changes. Before the war occurred, Great Britain depended largely on outside countries for their food stuffs. The submarine menace, however, taught them a stern lesson. Never again will they depend to so great a degree on other countries for their food. They have determined to increase their agricultural production, and most effective steps are now being taken to attain this object. It follows, therefore, that if Great Britain grows more at home, she will import less from Canada. The same lesson has been learned, although the necessity has not been so great, by other European countries, who had relied on North and South America for the greater supply of their food. It is natural that the argument about selling in foreign markets and buying in protected markets should be most strongly urged in Western Canada, where grain is grown for export. But the conditions of agriculture are changing very rapidly in Canada. Not so many years ago wheat was the principal source of farm revenue in Ontario. What is the case now?

The following figures from the Canada Year Book, 1919, show how the farmers of Ontario made their money for that year:—

Field crops	$373,507,000
Farm live stock	384,266 000
Tobacco	5,561,730
Creamery butter (1918)	13,136,470
Cheese (1918)	23,213,520
	$799,684,720

The value of all kinds of wheat grown in Ontario in 1919 was $40,701,000. Consequently wheat only represented about 5 per cent. of the total value of Ontario farm produce.

Roughly speaking, a new country starts growing wheat and gradually develops into mixed farming, and the progress of the Prairie Provinces away from the wheat-growing stage to the mixed farming stage has already reached extensive proportions.

The increase in farm live stock in the Prairie Provinces is set forth in Table 18, page 195 of the Canada Year Book, 1918.

	1911.	1916.	Increase.	Increase Per Cent.
Prairie Provinces:				
Horses	1,194,995	1,848,812	653.817	54
Milch cows	484,145	820,583	336,438	69
Other cattle	1,324,786	1,956,286	631,500	47
Total cattle	1,808,931	2,776,869	967,938	53
Sheep	285,130	495.689	210,559	73
Swine	712,222	1,362,046	649,824	91
Poultry	8,432,423	10,395,705	1,963,282	23

The growth of industry in Manitoba, Saskatchewan, and Alberta is also extraordinary. In 1900 the value of goods manufactured in these three provinces was a negligible quantity. For the present year a very conservative estimate would place the value of the goods manufactured in the three Prairie Provinces at $300,000,000. In 1900 there was not a single member of the Canadian Manufacturers' Association located west of the Great Lakes. At the present time there are seven hundred—five hundred of these in the Provinces of Manitoba, Saskatchewan and Alberta. In fact, Western Canada is becoming rapidly industrialized—the industries which have made the greatest strides being milling, packing, steel and iron, clothing, textiles, building and paper.

The Canadian home market that absorbs 80 per cent. of farm produce is the population of the cities, towns and villages. Analyze city, town and village, and it will be found that a considerable part of the activities of their inhabitants has its origin and existence in the factories. Manufacturing is the life blood of wholesale and retail trade, transportation, professional practice, and commer-

cial enterprises. Business clusters around the factory. Close or restrict the factory and business dwindles and the home market declines.

Another free trade argument is that under the protective system industry is developed at the expense of agriculture. It is submitted that the information and statistics set forth previously disprove this contention so far as Canada is concerned.

The average value of occupied farm land in Canada increased from $38 per acre in 1910, to $52 per acre in 1919.

Taking the Canada Year Book's estimate of the agricultural capital of Canada in 1917 of $6,830,145,000, and dividing this sum by the number of farms in Canada, given by Government statistics as 730,000, we find that the average capital per farm was $9,356. Moreover, our industrial development has not caused any undue depopulation of the rural areas. In 1911, the rural population of Canada was 54.47% of the total population. This is a marked contrast to Great Britain where the rural population was 49.8% of the whole when free trade was adopted in 1846, and had fallen to 21.9% in 1913.

It is also argued that, as Canadian manufacturers during the war produced munitions which compared favorably with those produced by other countries, they do not need protection now. This argument ignores the extraordinary conditions governing the munition industry. There was no competition. The price of munitions was fixed and calculated to yield a reasonable margin of profit where the business was efficiently conducted. The work was done to standard specifications. No selling force was required because the market took all the supply. More important still, Canadian manufacturers secured the opportunity to manufacture in large quantities. That is the pressing need today, and the home market is necessary to supply it.

It is also argued that protection causes combines.

Free trade England was the home of the world's greatest trade organizations; and the resolutions of Committees mentioned previously indicate a desire that greater facilities be provided in England for trade combination. Proper types of trade organizations produce greater efficiency, better quality and lower prices. Improper organizations can be prosecuted under existing laws. In any case, industrial combination has not reached undue proportion to date in Canada. The census places the number of manufacturing establishments at about 35,000, although this includes concerns which can scarcely be called factories. As the number of factory employees is estimated at about 700,000, the average number of employees per industrial establishment in Canada is about twenty.

A more serious charge is that Canadian manufacturers take undue advantage of the tariff, for example, by adding freight and duty to selling price of competing products in fixing their own selling prices. We do not defend such practice, but we submit that specific charges should be made against the offenders rather than general statements against all manufacturers, or against the protective system.

We beg to draw attention to an unfair method of attacking manufacturers, and through them, the protective system. A few manufacturers who have enjoyed marked prosperity are singled out. They are attacked in a sensational manner in the press and on the platform. Their profits for particularly successful years are advertized. Their financial statements are analyzed unfairly. No attempt is made to average the lean years with the good years. No tribute is admitted to efficiency, economical management, or unusual business ability. These outstanding examples of prosperity are held up to the public as a general condition of entire industries.

This method of argument is as unfair as it would be to hold up some phenomenal case of profitable farming, or a lucky strike in mining as an example of how agriculture or mining pays generally.

Let us consider how this is applied to the shoe manufacturing industry. Two or three of the most successful firms may be pilloried, in the hope, perhaps, that the public will conclude that their success was characteristic of all. A recent survey of the shoe manufacturing industry shows, first, that a very considerable number of firms have tried to succeed in this industry but have become bankrupt, and, second, that the average return on the capital invested in the shoe industry was 5.29 per cent. per annum. Dunn's estimate of failures of Canadian manufacturing firms for the last ten-year period is as follows:—

Year.	No. of Failures of Mfg. Firms.
1918	232
1917	261
1916	363
1915	655
1914	614
1913	452
1912	323
1911	321
1910	292
1909	354
1908	426

This is the other side of the story.

Where Will the Revenue Come From?

It is sometimes argued that the customs tariff is not a proper instrument to raise revenue. 43.5% of the total revenue of the Dominion Government was produced by the Canadian customs tariff in the fiscal year ending March 31st, 1920. In the fiscal year ending March 31st, 1921, the Minister of Finance estimates that the tariff will produce 43.8% of the total revenue. Leaving out items for demobilization and for investment and capital outlays, the balance sheet of the Dominion of Canada for the year ending March 31st, 1920, reads as follows:—

Total revenue	$388,000,000
Total ordinary expenditure	349,000,000
Surplus	$39,000,000

Suppose that we had had free trade and consequently no revenue from the tariff. Subtract the $169,000,000 produced by the tariff last year, and the above surplus

becomes a deficit of $130,000,000. The balance sheet would have read as follows:—

Total expenditure	$349,000,000
Total revenue	219,000,000
Deficit	$130,000,000

But the balance sheet leaves out items for investment and capital outlays. It is quite reasonable to omit these in presenting a balance sheet showing ordinary revenue and expenditures, but the actual balance sheet for the year ending March 31st, 1920, if Canada is to pay as she goes, should read as follows:—

Consolidated fund ordinary expenditure	$349,000,000
Investment and capital outlays	187,856,991
Total	536,856,991
Revenue	388,000,000
Deficit	$148,856,991

Assume that we had free trade and did not secure the customs revenue of $169,000,000. In that case, the deficit would have been $317,856,991.

For the year ending March 31st, 1921, the Minister of Finance, in his budget speech, estimated that the balance sheet will be:—

Estimated expenditure (including capital outlay)	$549,649,428
Estimated revenue	381,000,000
Estimated deficit	$168,649,428

Adopt free trade, lose the customs revenue, which he estimated at $167,000,000, and the deficit will be $335,649,428.

Those who would abolish the Canadian customs tariff and thus lose the revenue which it produces, suggest that this revenue should be replaced by the imposition of the following taxes—a direct tax on unimproved land values and natural resources, increased taxation on personal incomes, increased inheritance taxes, and increased taxation on corporations. As to taxing unearned increment as such, no objection is offered, but it must be remembered that vacant land now pays taxes to the municipalities and in some provinces additional taxes to the provincial government. In fact, much vacant land has been given up by the owners in preference to paying the taxes now imposed. Single tax has not stood the strain of financial depressions. Income taxes are now paid by individuals to the municipalities and also to the Dominion Government. Inheritance taxes are now imposed by all the provinces. Corporations are taxed as persons by municipal governments, provincial governments, and the Dominion Government. and also pay special taxes to every province for the privilege of being corporations. It is submitted that the suggested forms of direct taxation, while capable of some extension, cannot produce in one year the huge sum of $335,000,000 (or almost the entire present revenue of Canada).

The fact that the per capita amount of revenue raised by the tariff is greater in Canada than in the United States is often used as an argument that the Canadian tariff is too high. The explanation of the fact is simple. The United States imposes a high tariff on imports which compete with domestic products. But, because the United States has built up home industry by constantly adhering to the protective principle for 131 years, comparatively little is imported. Consequently, the amount of duty collected is smaller per capita than in Canada, not because the United States duties are lower, but because the volume of imports if comparatively much smaller.

Why Canada Needs Protection Against the United States

The overwhelming commercial weight of the United States, coupled with our geographical position in relation to that country, must be considered in framing all trade legislation affecting Canada's national growth and development. That country, with a population of 105,000,000 buys from this country of 8,000,000 people only about one-half the value of the goods which it sells us. Our exports to the United States and imports from the United States each year since 1907 follow:—

Value of Imports from United States

Fiscal year.	Amount.
1907 (9 months)	$155,943,029
1908	210,652,825
1909	180,026,550
1910	223,501,809
1911	284,934,739
1912	356,354,478
1913	441,141,562
1914	410,786,091
1915	428,616,927
1916	398,693,720
1917	677,631,616
1918	791,906,125
1919	746,920,654
1920	802,096,817

Value of Exports to United States

Fiscal year.	Amount.
1907 (9 months)	$79,021,480
1908	113,520,500
1909	92,604,357
1910	113,150,778
1911	119,396,801
1912	120,534,634
1913	167,110.382
1914	200,459,373
1915	215,409,326
1916	320,225,080
1917	486,870,690
1918	441,390,920
1919	477,745,659
1920	464,029,273

Last year, each inhabitant of the United States bought $4.41 worth of Canadian goods, while each Canadian bought $100.26 worth of United States goods. Significant also is the fact that our purchases from the United States were largely in manufactured goods while their purchases from Canada were chiefly raw material. It is not surprising that the rate of exchange is against Canada and that our money is at a heavy discount in the United States. This is the situation with a Canadian tariff. What would it be if the tariff were abolished?

The United States, even under the present customs tariff, which represents the policy of the United States low tariff political party, still highly protects those industries which need such protection as a safeguard for development: and we must not forget that even those manufactured

articles which now enter the United States free of duty will probably be protected if the Republican Party is returned to power. Consequently, few Canadian industries can afford to make investments based on the possibility of access to the United States markets. All investments in Canadian industries must be made principally for east and west trade within the Dominion, and export trade with other British Dominions which favor British products with tariff preferences.

The United States, under present conditions, is the competitor of Canada in international trade. Practically every staple product exported by Canada is also exported in much greater quantities by the United States. It is true that the United States is now manufacturing articles which we do not manufacture in Canada; but there are few articles which the United States makes that Canada cannot also make in time.

At present, Canada is under certain disadvantages in manufacturing in competition with the United States. In the first place, the United States has maintained a protective tariff since 1789. Factories sprang up and attracted immigration and capital. This in turn created a home market for farmers. City and country grew together. Capitalists who wished to invest their money in the United States knew that the country was committed to a stable and permanent policy of protection. Our policy has been very different. We did not adopt anything approaching a protective tariff until 1878, or 89 years after protection had been adopted in the United States. Even since 1878, we have had only moderate protection, and we have never been very sure that we would have any protection at all, owing to political agitation and free trade propaganda.

In competing with the United States industrially, we are immediately faced with the disadvantage of confronting a much older, stronger, wealthier, and more firmly established industrial system. It has immense reservoirs of capital which can be applied to enterprises. If a new process is wanted, they can afford to experiment, and if necessary, spend large sums of money in tests until they get what they need. Then they can build huge plants, advertise their products, and endure until a market has been created.

The transportation systems of the United States are on the whole, more firmly established than those of Canada. Individual comparisons between certain railroads will, perhaps, be to our advantage, but on the whole, their transportation system is the older and is better connected with their industrial fabric.

The United States customs regulations also operate to the disadvantage of Canadian exporters, who are embarrassed by the lack of facilities in the United States for the transaction of customs business. On the other hand, in Canada we have customs and ports of entries in interior towns and the road is made easy for the American manufacturer to sell and distribute his goods in Canada.

The United States has also greater labor reserves than there are in Canada. That country has been advertised throughout Europe as the land of liberty and opportunity; and immigrants have flocked there in millions, thus assuring their manufacturers of a stable and satisfactory volume of labor.

Probably the greatest advantage the United States has possessed over Canada is large scale production. The United States manufacturers are making goods for a protected home market of 105,000,000. Canadian manufacturers are making goods for a home market of 8,000,000.

The United States manufacturers serve the highly concentrated market which results from a huge population. Although the area of Canada is slightly greater than the area of the United States, including Alaska, the population of the United States is over twelve times as great as that of Canada. The result is that the United States manufacturer has his market at his door and saves money on transportation costs. Were it not for the Canadian tariff, United States manufacturers, secure in their own home market, could control ours, flood Canada with surplus goods until Canadian manufacturers were eliminated and then fix what prices they wished.

All these advantages in favor of the United States manufacturers make a handicap which is seriously felt by Canadian manufacturers, even with the aid of the protection which they now receive.

Briefly, we cannot manufacture extensively in Canada at the present age and stage of our industries, unless these industries are given protection against the industries of the United States. We have two choices. We can abolish our tariff and allow the United States to manufacture for us, while we produce raw materials for them, or we can persevere in our determination that Canada shall continue to develop as a manufacturing country as well as an agricultural country.

Most of the advantages possessed by the manufacturers of the United States over Canadian manufacturers are temporary and in time will disappear. There are people who say we cannot fight geography, overlooking the fact that geography has very little to do with nationality To secure proof of this statement one has only to consider the various countries of South America, mostly of Spanish origin and contiguous in territory, yet separate in nationality; or Europe, where various races are split up into numerous countries, bound together as units by the principle of nationality.

In Europe, there is a well-known phrase "peaceful pentration." Translated, this means the domination of a small country by a big country. The small country, it is true, often keeps the forms of national independence after freedom has departed, and remains bound in fetters of financial and commercial subservience.

The ablest men in the United States have been under no delusion as to the ultimate results of free trade between the United States and Canada. During the reciprocity campaign of 1911, Ex-President Taft and the late Ex-President Roosevelt were agreed that reciprocity would be a good thing for the United States. They wrote confidential letters to each other on the subject; then came the quarrel over the nomination for the Presidency, and the

correspondence was published by Ex-President Taft, on the 25th of April, 1912, at Boston, Mass.

In a letter from Ex-President Taft, to the late Ex-President Roosevelt, the following extract occurs:—

"The amount of Canadian products we would take would produce a current of business between Western Canada and the United States that would make Canada only an adjunct of the United States. It would transfer all their important business to Chicago and New York, with their bank credits and everything else, and it would increase greatly the demand of Canada for our manufactures. I see this is the argument made against reciprocity in Canada, and I think it is a good one."

In his reply, the late Ex-President Roosevelt stated:—

"It seems to me what you purpose to do with Canada is admirable from every standpoint. I firmly believe in free trade with Canada for both economic and political reasons."

Those who do not believe Canadians when they point out the dangers that free trade or a lowering of the tariff would bring to Canada, will, perhaps, believe such men as Ex-President Taft and the late Ex-President Roosevelt.

The above references to the United States are made in a friendly spirit. A certain amount of trade between the two countries is necessary and most desirable. But the people of the United States will appreciate the natural desire of Canadians to promote their own national development, while maintaining with the United States the most cordial relations.

Conservation

For some years the Commission of Conservation has issued repeated warnings that the natural resources of this country are not nearly so great as the popular imagination has conceived. We have been warned that we must conserve and that we must replenish. We cannot continue to take all from nature and to give nothing in return. Still, Canada is one of the few civilized countries in the world that has any considerable natural resources left. The important question is, what are we going to do with them? There are two courses we can pursue. We can plunder these resources and ship the raw or partly finished products out of the country to other countries, which will take these materials, manufacture them and sell them back to us in the shape of finished articles at greatly enhanced prices. The other course is to conserve, to manufacture in Canada not only the preliminary processes, but also the succeeding processes and export the products in a finished state. Under the first plan, for example, we would export our timber. Under the second plan we would manufacture it into highly finished products for domestic and foreign consumption. Under the first plan we could export our ores from the mines at low prices. Under the second plan we could advance these ores through all the stages of manufacture to the final stage, and get proportionate returns. Under the first plan only a limited amount of rough labour would be necessary. Most of the business connected with the processes of further manufacture, affecting banking, transportation and insurance, would go to enrich other countries, and part of our own population would be forced to emigrate in search of employment. Under the second plan we would carry these processes of manufacturing to the highest stage here, providing employment and creating business. The first plan is free trade. The second plan is protection.

Preferential Tariffs Within the British Empire

It is desirable to emphasize the advisability of establishing customs preferences among all the countries of the British Empire.

In June, 1919, the 5 per cent. war tariff, which has applied since early in 1915, against imported goods produced in British countries was completely removed by Parliament. This 5 per cent. war tariff on British goods was a war-time measure and its removal followed quickly after the termination of hostilities.

The British tariff preferences and exchange conditions unite to encourage importations into Canada from the United Kingdom. Their shipments to us for January, February and March, 1920, respectively, were in each month greater in value than in any previous month in the past history of this Dominion. For over twenty-three years the customs tariff of this Dominion has provided substantial preferences to the products of British countries —averaging one-third lower than the customs duties payable on similar goods of foreign production. Canada was the first British country to adopt the preferential tariff principle. The benefits of this pioneer work will not reach full achievement until the policy is generally adopted throughout the British Dominions. New Zealand is the only country so far that has reciprocated fully the spirit of the Canadian preferential tariff system. British South Africa and certain of the smaller British West Indies have granted minor preferences on a limited list of British products. But the desire to develop and maintain the national ties between British Dominions now seems to be tending surely toward the general adoption of preferential tariffs for British goods. The United Kingdom in respect to her dutiable schedules, has extended tariff preferences to the products of the British Overseas Dominions effective September 1st, 1919. The South African Government has announced that its tariff will be revised upward, and recent despatches state that there will be a wide margin of tariff preference for the products of British countries. In announcing the recent tariff changes in the Australian Commonwealth Parliament, the Minister of Customs stated that his Government was taking power to extend the Australian tariff preferences to British Overseas Dominions; and now Jamaica, Ceylon, British Honduras, British India and Malta, which never before expressed encouragement toward the principle of tariff preferences, are engaged upon the study of their schedules with the aim of extending preferences to the products of other British Overseas Dominions.

On the whole, prospects seem bright for the general extension of British preferential tariff systems throu

out British countries. Such an arrangement amongst British Overseas Dominions would correspond with the policy followed between the United States and United States overseas countries, including Cuba. A similar policy is followed toward their respective possessions by France and Italy, and was followed by Germany.

Tariff preferences would overcome the handicaps upon the exports of Canadian products. Import duties as collected in Australia apply upon higher values, in many instances, in respect to shipments from Canada, than upon like shipments from the United States. The tariff of Australia consists largely of percentage duties. These duties are assessed upon the value of imported goods as sold for home consumption at the time and place whence shipment is made directly to Australia, plus freight thence to the port of exit from the exporting country, and the whole plus ten per cent. New Zealand appraises importations similarly for duty purposes. South Africa appraises importations on the same basis, but without adding the ten per cent. The home selling price in Canada is higher on a large number of groups of commodities than the United States home selling price on like goods, caused by our higher manufacturing costs, owing to revenue duties on imported materials, equipment and supplies of a kind not obtainable here. Thus, goods shipped from Canada into such British Overseas Dominions, are assessed duty on a higher valuation than would apply on like goods shipped thereto from the United States. This results in a larger sum in duties being payable on the same goods shipped from Canada than would be payable on the same goods shipped from the United States. But, as already stated, tariff preferences would overcome these handicaps, while allowing each great British State to build up its own self-supporting fiscal system.

Canadian Factories in the War

Shortly after the beginning of the war the Canadian factory system was practically put on a war basis, and munition making was organized. How Canadian factories succeeded in war manufacturing is illustrated by the following statement from the report issued by the War Cabinet and presented to the Imperial Government. "The manufacturing resources of Canada have been mobilized for war production almost as completely as those of the British Isles." Munition work was done chiefly under the control of the Imperial Munitions Board—which placed orders in Canada amounting to $1,200,000,000. At the peak of operations between 250,000 and 275,000 workers were employed in making munitions including shells, parts, 64 wooden ships, 44 steel ships and 3,000 aeroplanes. At the same time Canadian factories largely supplied the Canadian people at home and the Canadian army abroad. About half the Canadian army came from the factories and half returned to the factories on demobilization. If we had not built up a factory system and allied business, if our manufacturing and business had been done for us largely by other countries; then Canada could not have sent as many men to the war, could not have supplied shells, ships and aeroplanes, could not have given large financial aid, and could not have absorbed her demobilized soldiers.

Conclusion

In the course of this statement an effort has been made to show that manufacturing in Canada is inseparably connected with other industries; that two million wage-earners and dependents secure their living through manufacturing, and that the most of the remainder of the population derive indirect benefits; that this country as a whole has made remarkable progress under the National Policy of protection; that, with the entire world swinging towards protection, Canada cannot relinquish it; that the revision of the tariff should be scientific and take into consideration the requirements of all classes, that a stable fiscal policy of protection with some assurance of permanence is a vital need; and, finally, that the aim of the fiscal policy, determined as a result of this tariff enquiry, should be to advance Canada towards her destiny as a fully developed nation within the British Empire.

Industrial Progress in British Columbia

By H. DALTON
Secretary, B. C. Division, C. M. A.

THE inauguration of a regular steamship service from Vancouver to India paves the way for establishing big cotton industries in British Columbia, which would manufacture Inlian raw cotton into manufactured products for the market of British Columbia, Alberta, Saskatchewan and Manitoba. At the present time these Western Canada markets are supplied by the manufacturers in Ontario, Quebec and New England.

Heretofore the establishment of cotton manufacturing industries west of the Rockies has never been considered feasible because of the large rail haul necessary for carrying the raw cotton from the Southern States. There has never been a regular service to India, and because of this, the cotton movement between India and Canada has been almost nil.

In the cotton movement from India to Vancouver over the proposed Canadian Mercantile Marine Service, there will be no transhipment necessary, but only one direct steamer haul from the port in India to Vancouver. This direct haul without the necessity for transhipment by rail means the minimum freight charges. Thus to Vancouver is afforded the opportunity to establish large cotton manufacturing industries.

With an annual cotton crop exceeding 8,500,000 bales, British India is the second largest cotton producing country in the world, being exceeded only by the United States. India could continually supply the raw product for British Columbia factories, and the cotton movement thus started would prove an important factor in the maintenance of the new service from India to Vancouver.

The annual cotton trade of British Columbia, Alberta, Saskatchewan and Manitoba, is estimated to be worth around

$50,000,000. Of this consumption of cotton goods in the four provinces, at least fifty per cent. comes from Ontario and Quebec, and the balance from the United States, with a little from England. Cotton mixtures have largely replaced Old Country woollens in both men's and women's clothing, and the consumption of cotton is annually increasing. The cotton seeds used every year in the four western provinces of Canada would easily maintain industries with a production exceeding $50,000,000, and the annual pay-roll of such industries would be around $10,000,000. This would provide employment for 10,000 hands. This is based on the usual industrial percentage, which allows a pay-roll of approximately a third of the value of the production. The value of the cotton production is based on the population of the four provinces and the Canadian cotton trade.

The new Vancouver-India service is to be a regular service. This means that cotton mills established in British Columbia would have no difficulty in keeping their industries supplied with raw cotton. Cotton in India is usually quoted lower than cotton in the Southern States because the latter market is largely controlled by a cotton combine. With the price in India considered and the all-water route to Vancouver, there is no doubt that cotton mills in British Columbia could very easily compete with the cotton mills of Eastern Canada in supplying the trade of the four western provinces.

Granby Coke Oven By-Products.

The coking ovens installed at Anyox by the Granby Consolidated Mining & Smelting Company for handling Cassidy coal, have proved a big success. From 420 tons a day of this coal there are being produced 300 tons of metallurgical coke, while the by-products recovered include 5,000 gallons of coal tar, 800 gallons of motor fuel and 5 tons of ammonium sulphate daily. At the present price of motor fuel the value of this daily production will be recognized.

The coal tar is shipped to a Vancouver company for the manufacture of creosote, while the ammonium sulphate is available for the production of artificial fertilizer, or the preparation of other ammonium salts for industrial uses. The present rate of consumption of Cassidy coal, namely, 420 tons daily, is the capacity of the ovens, while the percentage of recovery of by-products is very high, and proves beyond doubt the suitability of Cassidy coal for treatment in the Anyox ovens.

The information regarding the operations of the Company's coking plant was obtained from H. S. Munroe, the new general manager of the Granby Company, who has just arrived from his first trip of inspection of the Company's smelter at Anyox.

New Lumber Industry at Wattsburg, B.C.

A new company known as the B.C. Lumber Mills, Limited, will shortly commence construction of a huge lumber mill at Wattsburg, B.C.; W. A. Wilson, of Warsaw, Wis., is president of the company, which is backed entirely by American capital. Purchases of plant, machinery and equipment for construction of the mill are already on order, and boilers for the plant will be supplied by a company in Winnipeg. The company has acquired extensive timber limits in the Cranbrook district, and proposes to establish one of the largest mills in the province. Two portable mills have already been put in to cut lumber for the flumes required to bring the logs to the mill. Construction on the mill itself will commence in the near future and be in operation by the spring of 1921.

Labor Loyalty Week in B.C.

International Labor celebrated Labor Day by inaugurating a campaign in their ranks known as Labor Loyalty Week, during which it was the duty of each member of International Labor to ask and demand a union label on all purchases of merchandise; demand being made first for "goods made in Vancouver," and failing that "the union label of Canadian manufacture." The extension of this movement to other districts would have a marked effect in promoting the "made in Canada" movement.

Canning Factory for Kamloops, B.C.

A syndicate of Kamloops business men have purchased the processing plant of the Walhachin-Anglesey Canners, Limited, at Anglesey, on the Canadian National Railways near Walhachin, and will move the entire equipment to Kamloops. The canning equipment is chiefly for the processing of tomatoes, and will be installed in that city this year. It has a capacity of approximately 3,500 tins of tomatoes daily, working one shift, and if sufficient tomatoes can be obtained this season it is the intention to put up about 100,000 tins.

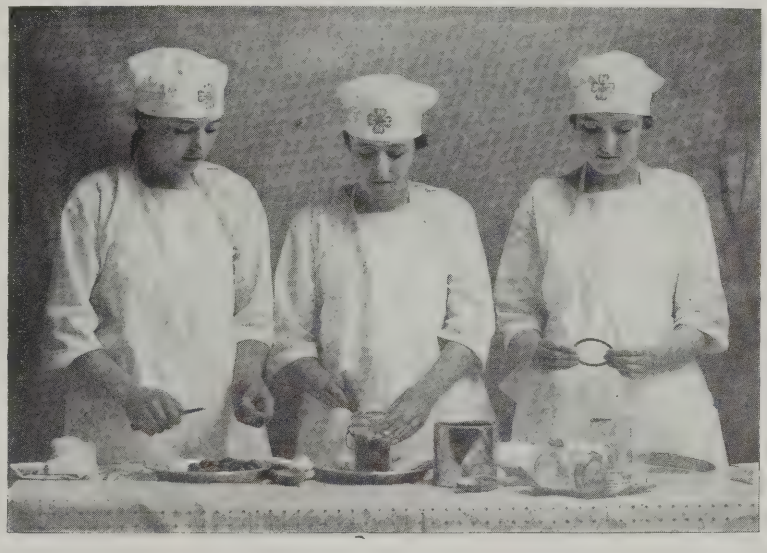
Boys' and Girls' Clubs in Manitoba*

By MARGARET REID
University of Manitoba

IN the 1919 Annual Report of the Agricultural Extension Service, it is stated that $14,500 were spent in grants to Boys' and Girls' Clubs. A disinterested party might pause to wonder what work the clubs were doing that justified such an expenditure. A club worker would read in such a report a broadening interest in club work and a fuller life for each boy and girl in Manitoba. He would read in it better homes and better farms for the coming generations; a fuller and more useful national life for our farm boys and girls.

Even Manitoba with its unlimited farming opportunity has been affected by the city-ward trend, which has been drawing many of our best boys and girls into city life. Boys' and Girls' Club work is an organized and definite form of extension work in agriculture and home economics. It is a movement designed to offer vocational training in the business of agriculture and home making. It is designed to teach the boys and girls to appreciate country life and to perform those tasks which country life presents in the most efficient manner. Through these clubs farm boys and girls become interested in the solution of farm problems. So by the influence of the clubs there will be established a broader and more satisfying country life.

At present in Manitoba there are 233 central clubs, 150 branch clubs, with 31,000 members. This organization was not launched full grown into the Province, but is the result of a steady growth. The first clubs to be established in Canada were organized at Stonewall and Roland, nine years ago. Neepawa, Manitou, Morris and Starbuck soon followed with similar organizations. In 1913 there were 460 members



*This article is an INDUSTRIAL CANADA prize essay.

In 1919 there were 31,000. New Boys' and Girls' Clubs are being organized each week and will continue to be until the organization reaches every boy and girl throughout the province.

The Boys' and Girls' Clubs have spread rapidly because they have operated through an already established organization, the public schools of Manitoba. The Manitoba plan recognizes the School Inspector as the natural leader in his division, and the territory covered by him is taken as the unit for organization purposes. This links the clubs up with the Department of Education and the branch clubs are established in the schools.

The organization of the clubs is carried on by the Agricultural Extension Service. From this head office general supervision is given to all the clubs. The central and the branch clubs bring the work of clubs into definite contact with the boys and girls. The central club is usually located at the district marketing place. It forms the centre for the branch clubs which are established in every school. Each part of the organization has a definite part of the work to do and elective executive committees help to carry on the work.

The success of the Boys' and Girls' Clubs has in part been due to the support which they have received from almost every organization and body of people. The Department of Agriculture, through the Extension Service, Extension lecturers, Agricultural representatives, Home Economic instructors and the Agricultural College, helps carry on the work. The general public assist the clubs through their Agricultural Societies, Women's Institutes and the Grain Growers' Association. Individual business and professional men are frequently found as secretary-managers of clubs. The support which is given the clubs is prompt and steady because the clubs deal with our greatest national resource, the boys and girls of the Province.

The Minnedosa Demonstration Team

Irene Beddowe, Captain; Jean Rorke; and Lily Beddowe

The most important body of co-operators in club work are the boys and girls themselves. Every boy and girl between the ages of ten and eighteen years whether at home or in school is eligible for membership for that year. In 1919, 31,000 boys and girls were enrolled. It was to this force that the government paid $14,500 in grants for prizes in club contests.

But at any time it is unwise to try to measure the value of an organization in dollars and cents. We either greatly over-estimate or else depreciate its value. So, to understand fully the possibilities of the club and to appreciate its efforts one must know the aims of such an organization. The central aim of the club may be said to be two fold; first to make better boys and girls, and second to use the activities of the boys and girls to build up agriculture in our Province. The first is the main object and the second a means of attaining it.

To say that the main object of the club is to make better boys and girls is rather a broad statement. The January Boys' and Girls' Club Bulletin 1920 outlined the purpose of the club.

1. To stimulate thought, initiative and leadership.
2. To foster in young people a sense of responsibility.
3. To interest boys and girls in the possibilities of the home farm.
4. To help boys and girls achieve success in manly and womanly jobs through club projects or contests.
5. To encourage the right attitude toward work.
6. To arouse a spirit of loyalty to the school, the home the community, province and nation.
7. To vitalize and motivate as much of the academic work of school as possible, by correlating it with club work, and thus bring it more in touch with the vital interests of the pupils at their homes and in the community.
8. To provide a healthful, interesting means whereby the boys and girls are enabled to earn some money which they can actually claim as their own. The boy who has earned a dollar has a better conception of its worth than the one who has not had that opportunity.
9. So to organize the Club projects that their successful completion will be a demonstration of the best methods to follow in solving some of the farm problems.

The Club work is based upon specific projects or contests. The word project is being preferred to contest, because contest implies a race for a prize and does not necessarily mean that any educational benefit will be obtained. If a Club member takes up some project or undertaking it means that he sets out to accomplish a definite purpose and is more interested in the final result than he is in the prize.

In the Manitoba Boys' and Girls' Clubs there are fifteen projects. There are projects in live stock, cow testing, poultry raising, seed growing, gardening, sewing, cookery, canning, noxious weeds, farm mechanics and in various other lines. These are things with which every farm boy and girl comes in contact and in which they are vitally interested. Many of them are doing work along some of these lines. The establishing of a club unites the efforts of the boys and girls and brings interest and inspiration to those who are trying to carry on some line of work. There is strength in union and each member will be helped in any co-operative effort. The influence of the Club is stronger than that of individuals so each year more boys and girls come to take an interest in the problems of the home and the farm.

To carry through a project and to accomplish its aim require a great deal of effort and perseverance on the part of a Club member. It is in the doing of the task that the purpose of the Club is attained. If a boy or girl enter a live stock project and raise for exhibition a calf they come to learn many new facts and understand many things. They will come to discover, perhaps to their astonishment that calves may be classified in other ways than just by color; that some calves grow into dairy cattle and some into beef cattle.

This will open a new avenue of thought for most boys and it will be one which most of them will be eager to explore. Plenty of literature can easily be obtained and project leaders should see that any interested boy or girl is well supplied.

After discovering that different cattle are suited for different purposes, a boy will naturally want to know something of the demand for good beef and dairy cattle. This will be a further incentive in his work. In his study of the problem he will realize the importance of cattle to the farming industry of Manitoba and will come to see where he can better the farming conditions on his home farm.

A boy entering the calf raising project cares for the calf, feeds it, and tends it in every way. For this work he receives definite instructions, and he must keep an accurate record of the feedings and of the development of his calf. This in itself is a great training for any active boy. He learns to work to a plan, to apply information gained. It gives him a training in keeping business records. Moreover, the boy will develop a pride and joy in doing productive work, and will develop an interest in real business.

One of the rules of the calf-raising project is that the calf must be owned by the exhibitor. This is a very important clause to the boy. In Manitoba the parents have memories sufficiently long to recall the days when they were young and on a farm where there were so many living things around which, though they tended and watched them, belonged to dad. Ownership to any boy or girl puts joy and incentive into tending and caring for any animal or plant. One person, when asked why he had left the farm and his poor old dad, replied:

"I left my dad, 'twas wrong of course,
Because my colt became his horse.
I left my dad to sow and reap,
Because my lamb became his sheep.
I dropped the hoe and stuck the fork,
Because my pig became his pork.
The garden truck that I made grow,
Was his to sell but mine to hoe."

The Boys' and Girls' Club encourages ownership, for by it the natural instinct of the child is appealed to, and a greater training will thus be received through the project.

All live stock and gardening projects have in them the same possibilities for any child. In the care of pigs or sheep, in the raising of poultry or the tending of a garden, a child will receive the same training. In doing the work a child is accepting a certain responsibility and is acquiring the right attitude toward work. By the work the home farm becomes a more interesting place, and a closer relationship is established.

A new feature which is being introduced into the club, and one which bids fair to raise the standard of dairy cows in Manitoba, is the cow-testing project. Manitoba is rapidly coming to the front as a mixed farming province, and this seems to be a very opportune time to start this new work. Cow testing on the average Manitoba farm is almost unknown. It is a well-known fact that in nearly every herd of milch cows there are certain ones that do not pay for their keep let alone return a profit. Testing cows to determine the quantity of milk and butterfat they produce in a year aims to get after the cows which may be termed free boarders. For, in order that Manitoba may maintain a position as a dairy province, it is necessary that every cow on every farm return to her owner a fair margin of profit. With this in view the cow testing project has been introduced into the Boys' and Girls' Clubs. This work is being carried on under the supervision of the Extension Service in co-operation with the Dominion Dairy Branch and the Provincial Dairy Branch.

Members, undertaking the cow testing, plan to commence work as soon as their cows freshen. Although only two cows need be tested, it is better that the whole herd should be entered. If only two cows are selected the best and the poorest are taken for the sake of comparison. At definite intervals throughout each month the milk of the cows being tested is weighed morning and evening, samples of the milk are taken and preserved in labelled bottles, and an accurate record is kept of the weight. At the end of a month the samples from each cow are taken to the centre where the testing is done. The percentage of butterfat is determined and entered opposite the weight of the milk. The sheets are sent to Ottawa when they are figured up and one copy is returned to the member and one to the tester.

Think of what the undertaking and the carrying out of such a project would mean to any boy or girl. Consider what a boost the establishing of such a project in the Club would be to the dairy industry of the farm, the community and the Province. Besides learning many valuable facts about cows, the proper feeding and care necessary in order to produce the greatest possible amount of milk, the contestant has done work which has involved a great deal of care and definite records. Moreover, it is a lengthy task. A task which can be accompliished in the first flush of enthusiasm means little to a boy in comparison with the task which must be carried on for a long period of time.

This year another very important project, and one which is being received with a great deal of enthusiasm by the boys and girls, has been brought into the Club work. This new project is team demonstration work. Teams may be trained for example in canning, dyeing, breadmaking, and vegetable raising. For years the boys and girls of our Province have been canning, baking, raising vegetables and chickens. Club members, who have been doing this work for years, are now ready to go one step further. Through the team demonstration work they are being provided with an opportunity to express in words and in actions the knowledge they have gained. Through it they will receive further definite instruction in the lines taken up. Once boys and girls come to tell others about what they do and how they do it, they feel inefficient and want to strengthen their knowledge with more definite facts and a deeper understanding of the subject in hand. Moreover the development which a member receives from facing a group of people, and expressing in words and in actions previously gained knowledge, will go far toward preparing them for service in their community and province.

Among the girls of the province team work in canning has been received with great favor. Special demonstrators are being sent out by the Extension Service to establish this project which bids fair to bring greater co-operation among the members, and to arouse a greater community and club spirit, by having the teams of various clubs competing against one another.

The projects in the Boys' and Girls' Clubs are not merely plans. They are projects which have received and are receiving the hearty support of the boys and girls. This is shown by the fact that in 1919, 887 pigs, 871 calves, 356 sheep, 255 colts and 4,443 chickens were raised and exhibited by club members. Cookery and gardening topped the lists with 9,792 exhibits in cooking and 9,433 vegetable exhibits. The exhibits have been increasing in number and improving in quality year by year. Because of Manitoba's world fame for vegetable growing, boys and girls are keen to produce better

What Workmen Think of Moving Pictures in the Factory

By LYMAN B. JACKES

THE bulk of praise and admiration resulting from the introduction of moving pictures to industrial plants has come either from the promotors of the picture machines or one or two of the executives of the concern which has taken the step. For all practical purposes these opinions may be considered negative. They are negative in that they do not assume a definite means of assisting a manufacturer to decide the value of moving pictures in his plant as an aid to production or in improving relations. The fact of a salesman producting his evidence in favor of the installation; or some friend in a far distant plant thinking that they are very good, does not provide much ground in itself for the costly experiment. Some evidence from the employee is needed and that is the heart of this story.

The Goodyear Tire & Rubber Company of New Toronto, recently installed some first-class equipment in the cafeteria of the plant together with means of excluding the major amount of the sunlight beating against the walls and windows of that portion of the plant. The first use of the equipment amounted to a "safety first" demonstration; as an addition to a campaign that had been commenced with a view of reducing the number of lost time accidents. Certain films were borrowed from other plants and safety societies and several showings were run off to various groups of workmen and executives. Comparisons of statistics and methods of accident prevention with other plants was the main item exposed with these films, and the results that followed the campaign was a reduction of the lost time accidents (one day or more) by fifty per cent. But it must be clearly stated that the results cannot be laid entirely to the credit of the animated projector. It played its part with allied factors, but it did not win the war. It was still a negative quantity in as much as its actual results were concerned.

The Goodyear Plant

Interior of Cafeteria where films were shown. Note operator's box in the centre

The next experiment at the Goodyear plant was much more positive as means were adopted to collect tangible evidence of the merit or demerit of the method in its relation to general employees service work. Some very beautiful films were exhibited showing the collection of wild rubber on the banks of the Amazon river in Brazil and this picture was followed by a four or five reel production displaying the manufacture of the fabric stock used in the preparation of the Goodyear cord tires. This series comprised the manufacture of the cotton cord from the cotton fields to the finished product. It required some three weeks to exhibit it as it must of necessity be shown in sections to some eight or ten groups of employees. Before it was shown the audience was warned that a composition or essay on the film would be welcome after the final showing. These essays were to be written outside of factory time and a large number were turned in. The authors were asked to express their opinion on the method of instruction and to outline the films so that the directors of the educational idea could make some kind of a tangible tabulation of results to justify the expenditure.

It was difficult to draw up rules and regulations for the experiment, as none were really wanted. The desired objective was a free and hearty expression from the workmen as to their opinion regarding what they had seen. Naturally many asked questions relative to the nature of the essay to be submitted. To one and all the following short instructions were given:

"Imagine that you alone have seen these pictures. On this assumption submit a report stating clearly first your candid opinion of the pictures. How much instruction you consider they contain. Their value to your fellow workmen and a brief sketch of the subjects covered in the pictures."

A large number of the audience turned in reports. All were fair, some very good and a few almost classical for their literary composition and the grasp of the situation which was indicated. A few extracts from these reports are rather interesting:

"Should the remaining pictures prove as interesting and instructive as those already shown, the Company will be more than amply repaid for their trouble and expense in giving the employees this information concerning the materials given them to work with. Prior to the exhibition of the first pictures the great majority of the workmen had little or no idea of the efforts of the Company to supply them with first-class stock."

"There was no doubt that the majority of the men working in the factory had a very hazy idea of the natural history of rubber until these demonstrations took place."

"Why cannot pictures of this type be shown in the moving picture theatres to us working men in place of the foolish screen manoeuvres of fake heroes and heroines?"

"I think the more knowledge a workman has relative to the materials in his department, the more intelligent his work will be."

"The pictures enable a man successfully to answer the questions from new men coming in his department."

"Pictures of this nature are a blessing to the working man as they enable him to see foreign lands which could not otherwise be visited. These films are educative from every points of view and are an incentive to the workman to learn more of his business, promote an interest in his work and take pleasure in things well done."

Other reels, dealing with different phases of the raw tire material are to be displayed in the near future. The pictures are held in the Company's time.

Development of Canada's Coal Industry

Address Delivered at Fernie, B.C., July 17th, 1920, to the Vancouver Board of Trade Party — Needless Transportation of Pittsburg Iron Ores — Make Use of Canada's Resources

By W. R. WILSON

President and General Manager, The Crow's Nest Pass Coal Company, Limited.

I DESIRE to assure you that it affords me more than an ordinary pleasure to have the privilege accorded me of attending this special meeting of the Manufacturers Association here to-day. One of the greatest privileges men have in this modern, excitable period of civilization is the extending opportunities of social intercourse with their fellow-men. The groups of men that are forming themselves into what is known as the Manufacturers Association are doubtless doing so with one predominating purpose in view, that is, to stimulate the progressive and wise development of the various forms of natural potential resources and vast economic opportunities that are to be found in the different sections of this great country.

In assuming these special functions in Society, the manufacturers should aim to understand and acquire a true conception of some, at least, of the sound basic fundamentals of the future principal manufacturing industries of the country. For example, at the present time, I believe that the Provinces of Ontario and Manitoba chiefly purchase and import the crude irons they use in the various forms of manufacture from the State of Pennsylvania, or from Pittsburg in that state.

Pittsburg's Iron Ores

The iron ores that are smelted in Pittsburg are chiefly produced in the State of Wisconsin, and brought to Pittsburg by three stages of transportation:—first, by rail from mines to lakes; second, across lakes by steamer to different points on the eastern sides of the lakes; then distributed by rail to the different smelter points. Then, after these three stages of traffic manipulation, the ores are smelted, and in the various forms of crude iron and steel, are shipped from Pittsburg to various points in Ontario and Manitoba for further iron products. Following this multiplication of transportation on the iron ores and iron, those engaged in the iron trade production in Ontario and Manitoba, through lack of fuel in these provinces, again go to Pennsylvania or Virginia to purchase the coal and coke fuels they use. In these duplicated processes of transportation and re-manipulation of the crude metals and transportation of fuels, the manufacturers of Ontario and Manitoba possibly absorb about twelve dollars excess per ton in all the finished iron products they make, which can only be regarded as a serious economic handicap to those engaged in those particular industries of these provinces that do not possess suitable fuel deposits for these purposes.

Then, the people in the West, who have so far failed to take advantage of their own natural resources, are called upon to purchase the products of iron and steel that are re-manufactured in the East, not only at excessive cost of production as above illustrated, but to pay for long repeated mileage costs of transportation, which have become involved in a system of production that is founded on either an oversight or a misconception of the sound basic principles of the industry.

In this district we have coal deposits that are, at least, equal to the best coals on this continent. The coal bedding in some instances is accompanied with exigencies that I have never seen in any other coal fields on this continent, which peculiar characteristic may be briefly referred to in my remarks here to-day as follows:

Formation of Canadian Coal.

When the mountains were lifted from the original lines of formation, which upheaval approximately lifted the structural bedding in some parts of the areas of this district from 500 to 3,000 feet higher than they were originally, considerably crushing, and contortional twisting in the structural mass occurred, which violent forms of crushing developed dynamic heat of various degrees of intensity. These forces volatilized the coal beds to a certain extent, also volatilized the beds of shale that intervene between the different beds of coal. These violent crushing mass pressures acting upon the sandstone, shale and coal measures of the district, that in some parts may be estimated at 2,500 to over 3,000 feet in thickness, also developed indefinite lines and artificial rent lines in the whole structural mass of formation.

In some portions of the fields rent lines appear to have been formed, thereby making it possible for the intense gas pressures to escape as the process of volatilization went on. In other sections this form of relief fracture does not appear to have occurred, hence, in certain districts of the mining, intense pent-up pressure of gas appear to have been formed in the small voids and cracks and cavities that have been created during the process of contortional and irregular crushing, which took place at the time when the general upheavals took place in the district. In some instances these small pent-up pockets of gas may be estimated to have assumed a pent-up force of about 210,000 pounds per square foot, or about 1,458 pounds per square inch. These difficulties, while of a very unusual nature in coal mining, are carefully approached and, through the medium of excessive care, may be safely dealt with.

In selecting this point for your meeting, you have shown a clearness of vision as business men, for coal mining centres all through the ages of progressive civilization have always been the chief basis on which business men have rested their thoughts and attention. In addition to this, it has at least always been my experience that people centred in coal mining communities are always responsive to progressive effort made by outside friends, and I am sure that Fernie will be no exception to the general rule so evident in mining communities.

England's Progress

May I take the liberty of stating that a little over two hundred years ago England began to learn how to make proper use of her abundant coal deposits. Before that time but little progress was made by England in progressive industrial civilization. Then, if we turn our attention to the

(*Continued on page* 92).

Our Trade With Cuba and the West Indies

AN EXPORTER'S VIEWPOINT

Shipping and Financial Facilities for Canadian Exports—Necessity of prompt Delivery—Avoid Havana as a Port—How Cuban Trade can be Assisted—Make use of Canadian Trade Commissioners—Understand the Latin Business Methods

By Lt.-Col. L. M. Cosgrave, D.S.O.

THE recently completed Commercial Treaty with the British West Indies has tended to bring the said Islands, together with their important foreign sister Cuba, prominently before the Canadian manufacturing public, and it is timely, therefore, to comment on the existing shipping and commercial facilities, and the difficulties encountered by one who has been directly in touch with such problems, more particularly in Cuba—but directly applying to the Islands which form the lesser Antilles.

It is necessary to mention but briefly the financial facilities, as these have been emphasized prominently by the Department of Trade and Commerce and the Canadian banks, notably the Royal Bank of Canada, the Canadian Bank of Commerce, and the Bank of Nova Scotia, who have pioneered in this territory with admirable foresight and success — and have set an example well worth following by Canadian shipping companies.

Havana, Cuba

The port at which most exports from Canada to Cuba are now handled

Unfortunately, British and American exporters in past years, before the Islands attained their present prosperity, were accustomed to extend long credits based on the annual crops of sugar, tobacco, and fruits, and this made it extremely difficult for smaller exporters to compete; but this has radically changed as a result of the unprecedented demand for sugar and tobacco, and it is now the custom with Island importers to pay cash against bills of lading F.O.B. cars, factory; against ocean documents, Atlantic ports, or C.I.F. Island ports against ocean documents. On the other hand with larger concerns, on bankers advices, shipments are also made against notes at 30, 60 or 90 days with the usual interest, which are readily discounted. The Canadian banks possess splendid facilities for providing new exporters with detailed data *re* Island consignees.

It is essential, however, despite the fact that Island importers look upon Canadian manufacturers with friendly eyes and are keen to establish business relations with them, that it should be realized that prompt delivery is the great factor in securing large and increased orders. The inland railway difficulties in the U.S.A., together with uncertain conditions in Europe, have forced the Island consumers to look elsewhere for a more reliable source of commodities. Hence their interest in Canada and her potentialities together with the widely advertised fact that this country had established her own Merchant Marine to carry her foreign commerce. The writer was established in Cuba during the organization of this service and the inquiries of the local Canadian Trade Commissioner were bewildering in their diversity and quantity. This is directly attributable to the fact that a weekly shipping service existed direct from Canada to Island ports. Unfortunately, this enthusiasm received a severe set-back during the prolonged strikes in Havana harbor, causing shipments from Canada to be seriously delayed, and causing Cuban importers to lose confidence in the efficacy of the Canadian Government Marine. From the writer's standpoint this loss of confidence was apparently justified. In the first place, owing to the high freight rates on the Island railways, shipments are required at the nearest port to the consignee, and the American shipping companies, such as the United Fruit Company, the Munson Line, etc., catered to this demand by making definite ports of call of all north and south coast ports of importance where excellent facilities for unloading exist. On the other hand the Canadian Government line limited itself to Havana, already in a state of congestion, due to the fact that over 1/11 of the tonnage of New York harbor is handled by docks which approximate 1/49 of New York harbor. This alone, aside from its unloading difficulties, would make it advisable to land cargoes at other Cuban ports and avoid Havana—not to mention the fact that 73% of Cuban imports are for ports other than Havana.

In addition, personal supervision of loading and unloading to facilitate sailings must be carried out at all ports of call; yet the Canadian Government Marine were forced to depend on the agency of an American importing firm located in Havana to expedite their growing traffic in the Islands, instead of, as would appear obvious in the development of this

important market, the establishment of proper Government offices, in charge of Canadians, with an efficient staff of inspectors to supervise personally the Canadian Government marine ships while loading and unloading in out ports, prepared to facilitate the same by their experience and close contact with the head office. Surely, if it was considered worth while by Canada to establish this direct line, it is worth while having direct control and maximum efficiency.

Imperative Necessities

The writer desires to emphasize this necessity, owing to the fact that numerous new lines are being added to the big list of countries with which Canada is in direct commercial touch, and yet it would appear to be somewhat unsound policy until lines such as that to Cuba are in sound shape and efficiently managed. Otherwise Canadian exporters will tend to be discouraged with the difficulties, the uncertainties, and the unforeseen demurrage and added charges with which one is faced on every hand in this closest and most assured market of Cuba and the West Indies. It should be further pointed out that there is an imperative necessity for published freight rates and all involved charges, together with definite sailing dates, ports of call, and cancellations, to be issued by the Canadian Government Merchant Marine for the benefit of Canadian manufacturers, as the delays at present in obtaining the necessary information cause, in numerous cases, the cancellation of orders, loss of interest by the inquirer, and a consequent loss to Canada as a whole. The writer desires to emphasize that there must be reciprocal interest exhibited by the Canadian manufacturer towards foreign inquiry and an earnest attempt to understand the viewpoint, particularly of the Latin importer, for we are still too insular in our Northern viewpoint of business methods, and a closer inquiry into Latin-American business and its enormous possibilities will astound the Canadian manufacturer, and will undoubtedly bring him most gratifying returns in the future.

In conclusion the writer would point out the importance of making greater use of the Canadian Trade Commissioners, who have every facility for supplying abundant and accurate data on the commercial possibilities, customs regulations, and market conditions, in addition to the foreign department of our Banks who are established in these Islands at all important cities. Finally it should be realized that personal contact is the finest medium possible and that Cuba and the West Indies can be reached and seen in the same time as our British Columbia. Yet we are inclined to think of these Islands as a somewhat distant market. It may also be of interest, in view of the recent St. Lawrence waterways discussion, to know that a shipment of 1,000 tons was loaded on an ocean steamer at Toronto for direct shipment from Toronto to Cuba, by the firm of L. P. Burns, Ltd., Toronto, in the month of July. This shows the further possibilities of our export trade, particularly when an all-water route, eliminating a double handling of cargo, can be secured.

Development of Canada's Coal Industry

(Continued from page 90).

neighbouring states, we learn from the industrial history of that country that about 116 years ago a man named Williams convoyed two small boats loaded with anthracite coal to Philadelphia, and tried to sell the coal to the good people of that city for twenty cents per ton. The people of Philadelphia were then, as now, regarded as some of the best business people of the States. They made the request on Williams to show them how to use the coal. Williams tried all one morning to do so, but utterly failed to convince the good people of Philadelphia that he was trying to do anything but impose upon them. He in turn left in disgust, giving them the coal, which they broke up and made sidewalks with. To-day millions of tons of this valuable fuel are sought by Philadelphia people at prices that were never thought possible one hundred years ago.

In the year of 1816, a second anthracite coal miner in Pennsylvania took two boat loads of coal down the Schuylkill River to Schuylkill Falls, where iron was being smelted in small charcoal furnaces. The miner tried to induce the men working the smelter to try his coal for smelting. They agreed to do so, and patiently spent all morning with him trying to light the anthracite furnace fires, and at noonday gave up, completely discouraged, salesman with them. They all returned from lunch to the furnaces, when, to their great surprise, they found the furnace melting hot, the furnace doors being melted. This was the accidental beginning of smelting iron with anthracite coal in the State of Pennsylvania. A few years later coke began to displace this class of coal in iron furnace smelting. If we may in consistency be allowed to look upon the State of Pennsylvania as a past industrial guide, we find that in the year of about 1916 that state produced about the same quantity of coal that Canada produced last year, 1919, which and since that time the same state has made an annual average progressive development of about 2,500,000 tons of coal. Last year, or during 1919 the state produced about 275,000,000 tons of coal.

It is the view of some of the residents of this country that this vast country should at least make corresponding progress in her industrial efforts to that which has been made in Pennsylvania during the last 100 years. The potential opportunities are in the country in the form of fuel and iron resources, simply awaiting the proper application of the energy and enterprise of her citizens.

Canadian-Japanese Trade Conditions*

The Extent of Japan's Pulp and Paper Industry and the Market in Japan for Canadian Pulp and Paper—Other Lines Which Canada can Sell to the Japanese—Hints on Getting Business

By A. E. BRYAN

Canadian Trade Commissioner to Japan

THERE are only a few small mills in Japan manufacturing ground wood pulp for sale. The total annual production of mechanical pulp in Japan is estimated to be nearly 200,000 tons, but the correct figures are almost impossible to obtain, since most of the leading mills manufacture for their own use and keep the figures of production private.

There have been no imports of mechanical pulp into Japan since the war, and I do not see any prospective opportunities in sight for business.

Sulphite Pulp

	1919.	1918.	1916.	1913.
Total	10,687,205	6,835,589	9,017,719	4,620,477
Canada	3,781,512	4,079,144	656,281	354,146
U. S.	3,859,774	2,333,858	1,205,173	113,622
Sweden	2,529,784	418,476	5,697,424	1,254,625
Germany	.....	4,109	73,024	2,176,454

Total, 28,742 tons in 1918, of which Canada supplied 18,240 tons.

The first presumption that will probably enter your heads is that the pulp manufacturers of Canada certainly must have been hot after Japanese business. But, with only one or two exceptions that I know of, this has not been the case at all, and our sales would not have been so successful if Japanese buyers had not gone out of their way to purchase same. I suppose that I receive more inquiries for Canadian paper pulp than for any other one article, and although our mills have been hard pressed to handle all the business received from other quarters, I am pleased to say that many of the inquiries which have passed through our Yokohama office have resulted in substantial business. From the returns just read you will note the remarkable change in Canada's contribution, say between the years 1916 and 1918. In the former year we supplied a little over 7% of the total requirements, while in 1918 we sold Japan 62.7% of what she bought. Last year our portion dropped to 38% of the total, but even at that we spplied over 752,000 lbs. more than our next competitor, the U.S., and we can presume that a good proportion of their shipments were made up of Canadian pulp.

Future Prospects of Pulp Business

Last summer I had the pleasure of taking a trip to the northern islands of Hokkaido and Karafuto. One of the chief objects of my visit was to investigate the pulp resources of Japan. Through the courtesy of the managing directors of the various pulp companies, I was able to go through every pulp and paper mill in the Hokkaido. I then went on up to Karafuto, and there had a most interesting as well as profitable insight into the pulp industry. I went through every pulp and paper mill, and saw two new mills in course of construction. I saw the process of manufacture from the taking of the logs out of the bush to the finished pulp and paper, and to our pulp producers in Canada I can say this, there will for a long time yet be a market for Canadian pulp in Japan.

In the first place, nearly all these mills are now 5 to 20 miles away from their log supply. In most cases there are no available rivers to boom the logs down to the mill, as is the case in this country. The logs, which are cut in 12′ lengths, are therefore all drawn by horse, in some cases ten mills, to the nearest railway siding. (Owing to this situation the Japanese are now looking for pulp wood in Manchuria and Siberia, where mills will be built.) Here they are stacked up to be hauled down by train during the summer months to the mill. The cost of getting these logs from the bush to the mill must, in most cases, be very high, in spite of the advantage of lower wages. These logs are brought down by rail line in some cases from 20 miles distance, while in many places the logs have been all cut and used up close to the railway, and, as I say, they are bringing them in from a distance of five and ten miles, perhaps only one log at a time, depending on size. In some districts the logs are drawn down to the sea and boomed from there to the mill in what are called "Ikada" or rafts. These logs are cut from what is called "Matsu" (pine). About 70% are Ezo Matsu, while the rest are Todo Matsu. Although Todo Matsu makes more pulp per cubic foot, Ezo Matsu is used the most because its fibre is stronger. About 70% of all the timber in Karafuto is Ezo Matsu, but Japan has here only a few years' supply of pulp wood.

I therefore feel quite certain that Canadian pulp will always sell in Japan, for the following reasons:

1. On account of the extensive handling of logs by hand and methods of bringing same to mill, costs are of necessity high.

2. Although the cost of labor is half that in vogue here in Canada, I figure that two Canadian workmen will have the same efficiency as three Japanese. It therefore takes more men to look after a machine in Japan than in Canada.

3. Wages in Japan are continually advancing, so that ridiculously cheap labor is really a thing of the past. I was rather amused to read in a Canadian journal the following news item:

"Made Paper 250 Years Ago."

"The Japanese paper industry was already established nearly 250 years ago, when the Dutch traders set foot in the country. To-day, nearly 150,000 people are said to be employed, at an average daily wage of 24 cents. Labor at this price leaves plenty of room for price-cutting."

This is very far from the truth. In all mills I visited in Hokkaido and Karafuto the men laborers were receiving the equivalent of $2.50 or $3.00 a day. They received $1.00 a day wages and free house, while they could get their rice, clothing and other necessities at one-third of the price charged in retail stores. The management figured that they were thus getting the equivalent of $2.50 or $3.00 per day. Women laborers get 50 to 60 sen per day, and house, etc.

4. The Japanese mills do not make bleached sulphite pulp, although some of the mills bleach pulp for their own use.

5. Canadian pulp has the reputation of being the strongest in fibre of any pulp on the market.

6. Canadian, up to the present, has been the cheapest, and therefore the best value for the money, of any other pulp. Its market price is often lower than that of domestic production, and really the local mills have to regulate their prices to meet the Canadian.

*This is the second instalment of the address delivered by Mr. Bryan at the Annual General Meeting, C.M.A., Vancouver, June 9, 1920.

7. Canadian pulp is now well known, and these mills who have been using it, being conservative, will want to continue using it. Some of our brands are established, and will now almost sell of themselves.

8. Japanese timber supply will not last long. Some of the mills have already bought up large tracts of forests in Manchuria and Siberia, where they will build mills.

I also think that this business could be considerably enlarged if more Canadian mills would cater a little to it, and send out their own representatives to study the requirements and consult with the users, etc.

Production in Japan of Sulphite Pulp

Perhaps you would be interested to hear what Japanese mills are capable of producing. In 1919 the production of sulphite pulp, unbleached, for sale amounted to 73,404 tons. Of this amount 64,044 tons were sold in the open market. Three of the pulp mills in Karafuto are to double their capacity in the near future. It is estimated therefore that the domestic supplies of sulphite pulp, unbleached, for sale in Japan this year will amount to 90,000 tons, while some paper men state that by the end of 1921, 150,000 tons will be produced.

Consumption in Japan

The consumption of sulphite pulp in Japan is not definitely known, although those in the know state it to be approximately 120,000 tons. But we do know it has been increasing every year, and some idea of the requirements may be gained by comparing the output of paper during the past six years. These figures include about 50% of newsprint.

	Lbs. (approximately).
1914	327,000,000
1915	367,000,000
1916	405,000,000
1917	455,000,000
1918	499,000,000
1919	519,000,000

Imports of Chemical Pulp

During the same period the imports of chemical pulp have been as follows:

Year.	From Canada. Tons.	Total Imported. Tons.	Value Declared. Yen.
1914	2,924	45,342	4,574,212
1915	7,774	53,688	5,974,892
1916	5,672	57,720	9,017,719
1917	8,580	14,334	2,800,744
1918	18,000	28,762	6,835,589
1919	15,426	40,744	10,696,233

It will be seen therefore that there is a market for about 40,000 tons a year of imported sulphite pulp. It is up to Canadian mills to maintain the lead in this business. There are many improvements to be made in the Canadian product, for there is no use in denying that some Japanese prefer the Swedish pulp for quality and will pay higher for it. It is said that our pulp is stronger than the Swedish in fibre and, if our mills paid more attention to packing and grading, that we could increase our business.

Effects of Exchange

One of the features that worked against us last year was the fact that as soon as American exchange started to go up some Canadian mills demanded payment in American gold dollars. Thus for instance in January last, Canadian easy bleaching sulphite coming in quality between the Swedish 3 crown and 2 crown, cost the Japanese importers over 10¾ sen per lb. at the rate of exchange for American gold dollars (49⅞). On the other hand, the rate for the pound sterling was rapidly dropping and Svartvik 3 crown bought at £28 and 2 crown at £27 10s. per 1,000 kilos c.i.f. Japan cost the Japanese importers only 10½ and 10⅓ sen per lb. laid down, duty paid. This accounts for the increased shipments of Swedish pulp, because the imports from Europe were costing the buyers less than those from Canada.

If at all possible do not specify "Payment in U. S. Gold Dollars" but "Payment in Canadian Funds." In some cases where a manufacturer must pay for his raw material, etc., in U. S. currency this may not be practicable, but stick to the flag, if at all possible, every time. I should think that pulp is one of the things that could be manufactured and sold in any country for Canadian gold dollars.

Paper (1918 Total)

	Yen.	Canada. Yen.	U.S. Yen.
Printing paper (under 58 grammes per sq. metre)	1,040,073	..	1,026,946
Other printing paper	2,898,428	..	2,635,625
Writing paper	578,879	..	254,978
Drawing paper	118,023	..	4,801
Packing paper	2,012,917	..	1,838,038
Match paper	68,869	..	47,560
Cardboard paper	912,198	..	908,748
Tissue paper	251,008	..	161,590
Parchment, paraffine paper	....	..	....
Wax paper	441,971	..	330,883
Fancy paper	574,967	..	509,651
Other papers	498,157	2	336,612

Although Canada secured the magnificent total of yen 2.00 worth of business with Japan in paper in the year 1918, I think that if the figures were procurable for 1919, there would be at any rate a small increase, as I know of shipments of wrapping paper which were ordered in Montreal. However, Canada certainly should do better than the above figures will illustrate.

Send Travellers to Japan

American mills send their travellers over to Japan to drum up the business and deserve all the business they get. There have been no Canadian men that I know of who have in recent years touched Japan to look into market conditions. You will never get, nor do you deserve to get, export business by sitting down in your comfortable offices, expecting to have orders flow into your hands of their own accord. The firms who send out their salesmen, prepared to stay a few weeks in the country to familiarize themselves with the East, to meet the Japanese in the trade, to be entertained and to entertain, to show samples and quote prices delivered Japan, to meet buyers half way at least, if their specifications should vary a little from what is used at home, these are the firms who are going to build up a successful and permanent business. Some American and British mills have their own offices in Japan, others have one of their own men out there, who works in co-operation with their sole agents. He attends to claims, studies the requirements, etc.

Yes! There is a good business to be had in Canadian papers if we want it. Up to the present our mills have apparently not cared for it, so naturally they did not get it. For instance, I know of one firm who sent in orders during the last six months for 120 tons of high-grade bonds and 12,000 reams of other writing papers, but to date have only been able to get 10 tons. How can we build up a business, if firms in Canada will not send us the goods? If they are sending it to other countries, why not Japan? I would strongly advise our mills not to be indifferent to the Japanese market. There will probably come a time when your European customers will be able to get their requirements filled in Europe, when your Australian or New Zealand friends will through various causes not require as much as they have been importing during the past few years, when our American neighbors may get some of their supplies from old sources in Europe. We cannot tell what the future conditions will be, but we do know this, that the pulp and paper industry in Canada is expanding and, as our capacity increases as it is

A Japanese Paper Mill

Showing the up-to-date character of the paper industry in Japan

oing by leaps and bounds, we will be looking for foreign itlets. But do not look for those outlets in Japan if you tend to neglect that market now, and do not think you can ot over to our next-door neighbor and sell anything you ve left over to them just whenever it pleases you. If you , you are greatly mistaken, because you will be forestalled. nerica is forestalling you right at this present time—while, England is now, so Scandinavia and Germany will before ng be pounding at the back door endeavoring to get in again this business.

What I would like to see some of the mills do, is to lay ide say 1%, 2% or 5% of their output for Japan. There e plenty of good Japanese firms who would be only too xious to get your paper and pulp. These shipments, although perhaps small, would at least be an advertisement of hat we produced. They would at least cause the mouths the Japanese consumers to water for more, and then in ture when you have more available for export to Japan—ou would have your channels dug through which your oduct could be put on the Japanese market. Just think that er, and if you decide to follow my advice in the matter, let me know. I will be delighted to co-operate with you in this direction. This not only applies to paper but to all lines exportable to Japan.

Output of Paper in Japan in 1918-1919

According to the investigation of the Paper Union, the tal output of all kinds of paper, except straw pasteboard, ring 1919 amounted to 519,142,000 lbs., the figures showing an increase of 20,177,000 lbs. over 1918 and of 65,042,000 lbs. ver 1917. The following table denotes the output of the different kinds of paper during 1919 and its comparison with 191

Kind.	Output for 1919. Lbs.	Comp. with 1918. Lbs.
Fine printing paper	72,737,000	895 Dec.
Common printing paper	81,985,000	1,913 Inc.
Newspaper	229,762,000	...
Imitation paper	25,991,000	1,217 Dec.
Rolled paper	12,276,000	1,415 Inc.
Match paper	10,296,000	418 Dec.
Colored paper	5,449,000	941 Dec.
Packing paper	23,961,000	4,524 Dec.
"Renshi" and "Toshi"	9,766,000	812 Dec.
Miscellaneous paper	46,920,000	2,937 Inc.
Total	519,142,000	20,177 Inc.

The following table shows the production of paper by every paper mill during 1919:

Kind.	Production. Lbs.
Oji Mill	192,223,000
Fuji Mill	144,209,000
Mistu Bishi Mill	51,077,000
Kyushu Mill	28,514,000
Kokura Mill	20,447,000
Yokkaichi Mill	17,928,000
Kiso Mill	15,844,000
Central Mill	14,366,000
Tokyo pasteboard	12,979,000
Tokyo, Hokuyetsu Mill	6,266,000
Kumano Mill	4,005,000
Umedzu Mill	3,905,000
Nakanoshima Mill	3,650,000
Yutansha Mill	2,379,000
Total	519,142,000

Asbestos (Imports in 1918 compared with 1917)

Lump, Powder and Fibre—

	1918. Yen.	1917. Yen.
Total	1,606,930	2,271,144
Canada	655,434	210,964
United States	810,434	1,820,937

Where do you suppose America is getting all this asbestos which she sells to Japan? Canada prides herself on the assertion that she supplies 85% of the total world's output. From investigations made I find that nearly all this asbestos is purchased from brokers in New York. That is, American firms are handling the sales of our natural products, and thus are taking the cream of the profits for themselves. It is time we became a little more independent of our southern neighbors. Let us be up and doing! We should handle our own natural products from the time that it is taken from its natural state until it is landed in the various foreign markets of the world. We must have our own export houses, good substantial firms with their own branches in all overseas countries where our goods can be sold. These offices must be manned by good live Canadians who are full of pep and tenacity and who will push their lines against keen competitors. Why should we be dependent on foreign commission houses for the sale of our products abroad? Just before coming away I wrote to seventeen of the largest users of asbestos in Japan. As a result of enquiries made I found out that in nearly every case they were buying "American asbestos"—they did not realize that what they were using originated in Canada. But in nearly every case they asked me to have Canadian shippers write to them sending prices and samples.

They were all keen to buy from Canada direct. Canadians, wake up! (or as the Japanese say, "Shikkari Shitamae" or "Shikkari Shi Nasai"—pull yourself together). Why should we take off our coat and give it to others, when we can use it ourselves to advantage?

This asbestos is used in Japan for making all kinds of asbestos products: slates, shingles, corrugated plates, yarns, clothes, packing, jointings, rope, in fact just about everything in the asbestos line. There is a fair demand for imported manufactures, such as millboard, cement, etc. (1918, 398,971 yen), but by far the greatest market is for fibre and the "R/M" quality for shingle and slate manufacture.

The Government encourages this industry, as it encourages almost all industries in Japan. No foreign asbestos manufactured goods can be sold to Government factories, arsenals, shipyards, railways, etc., which are of course the largest users. They always specify home-manufactured goods.

Iron and Steel (Imports in 1918)

Total—		Canada.	U.S.
Pig iron	59,092,337	63,962	2,998,422
Iron ingots and billets	4,348,445	....	3,809,507

do. (not coated)	13,211,295	44,568	12,611,767
do. (coated with base metals)	384,960	....	178,619
Waste or old iron	16,746,351	86,047	5,522,028
Other iron	391,936	....	358,216
Grand total	299,757,331	865,591	219,938,138

If there was a large Canadian steel corporation in British Columbia I do not think I am very reckless in my assertions when I say that Japan would take all the surplus supplies over what would be required in this Province.

Japan is dependent absolutely on the rest of the world for her steel supply. When the war broke out in 1914, Japan was consuming annually about 1,000,000 tons of iron, two-thirds of which was imported, while the other one-third was produced by the Government Steel Works at Yawata.

The Government being fully aware that if Japan wished to become one of the first-class powers, both industrially, as well as in every other way, she must assure herself of supplies of iron and steel, therefore passed the Iron and Steel Encouragement Regulations, which gave steel companies the following privileges:

1. If the works were to produce more than 35,000 tons per year, the right to expropriate property on which they wanted to erect the works.
2. Exemption for ten years from National Business and Income Tax and from all forms of local taxes.
3. Exemption from import duty for the machinery required for the works.

Some seventeen plants have now been established for the manufacture of steel, whose total capacity in 1918 amounted to about 765,000 tons, while the consumption was calculated at about 1,113,000 tons. The ore used in the local mills was practically all brought from China. The pig iron, of which about 60,000,000 yen was bought in 1918, comes almost entirely from China, which country was responsible for 50,000,000 yen of it, Great Britain, Sweden, United States, and Canada contributing the rest. What a remarkable opening this would be for these British Columbia ores, if they were worked worked up, but could not be used in Canada. But there should be an iron and steel industry on this coast, which would not only supply Western Canada, but could cater to the requirements of trans-Pacific countries. Think what a magnetic power it would have on the commercial upbuilding of the Province as a whole. You get your iron and steel industry here and the other industries that depend on it for supplies will soon rally around, in the same way as they have grown up in the iron and steel localities in other parts of Canada. The iron and steel industry is the foundation stone upon which the commercial success of the country is built up. We must have it, and we must have it in this Province. I hope that some of you manufacturers, the driving force in Canada to-day, will look into the situation while you are here. On the other hand, I know that you will all lend the province of British Columbia your support in everything that will lead to the establishment of this most important of industries on this Pacific Coast. Think what a saving in freight alone. Nearly all the Canadian steel going to Japan comes from Eastern or Central Canada. How much better it would be if Pacific freight boats could load all steel materials right at the mill, the same as our Atlantic ships do, and thus save over 3,000 miles of inland freight. Nothing could possibly do more to increase our exports to Japan. It is not necessary for me to say what the demands call for. There is a market for almost everything in the steel line, from pig iron down to scrap oil cans, and second-hand saws, etc.

I might mention that Canadian-made tubing, gas pipes, etc., have been imported in increasing quantities of late, and are giving good satisfaction.

Always Ship to Specification

I might mention, too, that I have had to hear quite a few complaints during the last two years about Canadian steel being shipped to Japan, which did not conform to specifications. I have seen Lloyds surveys of some of it, which bore out the claims of the Japanese importers. But I will not say anything more about this matter, as of course it does not apply to all our steel mills by any means. But, I will say this, do not think that your little Japanese friends are ig noramuses. They know just as much about steel as we do and there is no use trying to slip anything over them, particularly if the market is going down. They will kick like steers then at the least technicality, so be careful! Always send them the pick of your stock. If you do, they will continue to buy; if you do not, and happen to get, say, a few wrought iron bars in with a shipment of mild steel bars (perhaps purely by mistake), then you're finished. They will knock not only you but Canadian goods generally. Do you know that one of the largest British importers told me recently that as a result of one shipment of Canadian steel which one Japanese firm received through him, and which did not quite come up to scratch, that two or three of his clients specified recently in their orders "No Canadian Steel." This shows you what one bad shipment will do. Prepare for future business by cultivating your market now.

Grand Total	29,805,548	279,687	27,922

As time is limited, I will not dwell at any length here, xcept to say that Canada should be able to increase its ship-ents of nails, screws, bolts, rails, structural material, ains, agricultural implements, drills, reamers, etc., to Japan. But these lines will not sell of themselves. They must pushed vigorously against competing goods now on the arket. One of the reasons why Canada's share is so small ring 1918, is that she could not handle many of the en-iries received as delivery could not be made.

Automobiles (Imports in 1918)

U.S.	3,134,286	....

I wrote a report on the market for automobiles which peared in Weekly Bulletin No. 843. If you are interested ndly refer to it. You will note that all the cars except venteen came in from the U.S. These might just as well me from Canada, but I find that most of the companies in nada have arrangements with parent or affiliated concerns the U.S. that prohibits them from selling to Japan.

Machinery (Imports in 1918)

As regards Canada's share, which you will note is very s all, she supplied semi-rotary pumps, and some milling chines all of which proved satisfactory. I have not men-ned machinery such as spinning machines, because they not made in Canada to any extent, but the demand for m in Japan is something tremendous—something like 0,000 spindles are on order in England and America, al-ugh only 200,000 can be expected to be delivered this year

I cannot understand how it is that Canadian exports of ber do not make a better showing. One of the most im-tant lumber importers in Kobe told me recently that the rle always consider Canadian Douglas fir better grade than A erican, and that sometimes they can get more for it, but ough he buys considerably from B.C. mills, he finds that ost invariably he can get a slightly lower price in the Western States (in spite of the H. list) and that also freight es from American ports are usually a little lower so that can land U.S. lumber cheaper in Japan than Canadian.

I think if this is the case there is something wrong. I k the lumbermen of this Coast should look carefully into th situation and find out if this is correct, for it certainly uld not be tolerated. As long as these conditions last, so lo will Japanese buyers purchase to the south of us. I get many letters from Canadian exporters of lumber asking for an outlet, indeed far more than I have enquiries for from Japanese buyers, and although I try to put them in touch with good firms and correspondence is started, twice only in recent months has any business resulted that I know of. If Canadian exporters are to get this business they must first rectify any advantages which our neighbors may have over us in point of shipping, quotations, etc., then they must come out to Japan and get personally in touch with the demand market and show buyers the advantages of buying Canadian lumber, and the good service that they are assured of from Canadian mills. This is B.C.'s business; they should supply Japan with all their requirements of such woods which are prolific in the province. It is up to her exporters to first make up their minds they are going to get this business and then get out after it.

Japan's timber resources are nearing depletion. By far the largest portion of the remaining virgin forest land is owned by His Majesty's Household. Only a short time ago the Emperor gave over a big patch to the Government to dispose of to the public on account of the increasing demand for timber. The City of Osaka, with over two million people, is going to carry out some big improvements in the way of widening streets, new buildings, etc. This will mean a big demand for building lumber. There is no lumber of large dimensions grown in Japan. It must all be imported. The pine they import is used for ceilings in Japanese houses; the Douglas fir for building. There is also a big demand for cedar for pencil-making; you will note that over 320,000 yens worth was imported in 1918.

Demand for Match Splints

The Japanese match manufacturers have been considerably embarrassed of late on account of the growing decrease in the supplies of aspen and poplar woods for the making of the sticks. The disorder in Siberia, which has been the chief supplying country, has made it well nigh impossible for Japan to get supplies satisfactorily. It is said that there is 3,000,000 cubic feet of wood piled up along the Siberian railroads ready to ship, but there is no transportation. Supplies from Europe and Korea are insufficient. I cannot understand why the Japanese match people have not before turned to us for supplies of poplar wood. The imports of poplar in 1919 amounted to 13,000,000 cubic feet. On account of this scarcity of lumber, prices have gone very high.

I have samples of the wood required, and will be glad to meet any of our lumbermen who can supply this wood to Japan. There is imported into Japan yearly about 30,000,000 cubic feet of lumber for match industry. This wood is usually shipped in logs of 7 feet lengths and not less than 8 inches in diameter.

One firm I was speaking to said they were importing a trial shipment of white and jack pine from America for match stick making. They must have a soft wood, light in color. Soft so as the splinters will not bother the hands of the little Japanese women who pack them.

In 1918, aspen woods for match sticks was imported to the value of 1,961,684 yen.

Other Articles for which there is a Demand

All of the imports to which I have just referred to in detail, have been exported to a more or less extent from Canada. There are many other items which are imported into Japan, but which are not mentioned in that part of the returns dealing with Canadian trade. However, our American friends have built up a substantial business in other lines not mentioned so far. I think there is no reason why Canada

should not also do something in these articles which I am about to enumerate, certainly if not at present, in the very near future. So with this ultimate object in view Canada's manufacturers should prepare now or at least do the spade work which will bring home the bacon.

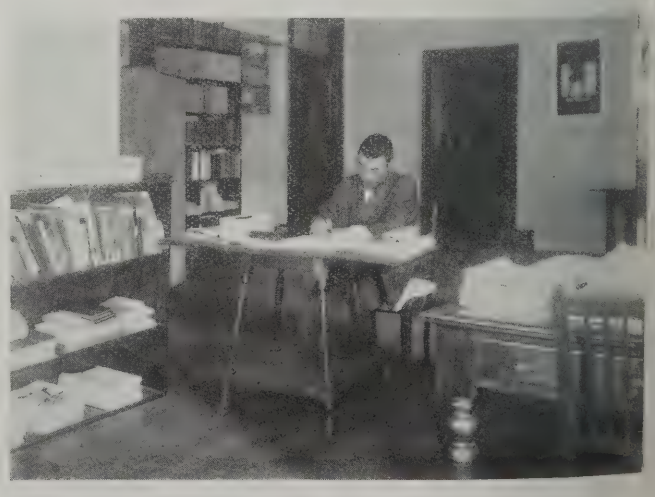
Why Canadian Business is Small

In answer to this question I may simply say that, as far as Japan is concerned, Canada lacks all those mediums through which export business should be solicited and catered to, all of which are indispensable, all of which are part and parcel of every other country's trade with Japan. In the first place, we have

No Canadian Export Houses in Japan

In the city of Yokohama there are some 500 foreign export and import commission houses. I suppose, out of the 100 largest firms, fifty of them are British, some of whom have been located in Japan ever since it was first opened to foreign trade. These firms have their special import departments, which are often sub-divided into different divisions, such as the paper and pulp division, the machinery division, the lumber division, and so on. Usually each of these divisions is in charge of an expert, under whom are Japanese salesmen or bantos. These foreign firms have really built up the trade of Japan. In the early days they did all the importing and most of the exporting. Now, of course, there are reliable Japanese firms, which do the biggest volume of business. But these foreign import houses are really indispensable to their respective countries, in that they represent manufacturers at home who are completely dependent on them in the selling of their goods. They are right on the ground, they know their customers, they understand the market, they get out after the business, they look after all the financing and take all the responsibility of the Japanese end of it. When a travelling salesman comes out from one of the firms which they represent, they look after him, take him around to their customers, and "show him the ropes," as it were. These people are a potential asset to the British manufacturer. They send in their orders, and all the manufacturer has to do is to follow instructions sent in by these "trade getters."



Now, as far as I know, there are only one or two Canadian commission houses in Japan, and they are of no concern to us, as they are there solely for the purpose of buying Japanese goods.

The Canadian manufacturer has, therefore, no Canadian firms to represent him, whereas, if he goes to one of the British houses he will probably find that they already represent a house making a similar line in England. There are, of course, a few export houses on this side who have other firms representing them in Japan. But this is not the same thing. *We must not be dependent on other nationals to assist us. We must have Canadian co-operation and Canadian organization, from the time the goods are manufactured in Canada until they land in Japan.* This must be our ultimate object, and the sooner we be up and doing, so much sooner will our trade expand in all directions.

Where are Our Salesmen?

I intimated a little while ago that salesmen are just as important in export trade as they are in domestic business.

You go into any of the foreign hotels in Japan and look down the register. You will find (after being told that you cannot get a room, that they will put you on the waiting list, although there are 57 already down on it) that the place is filled with foreign salesmen, and if you talk with them you will find that they all represent the best firm of its kind in America (usually) and that they are going to literally gobble up business. Well, some of them do, and perhaps some of them don't, but at any rate it does not affect the point I wish to make, and that is, that one hardly ever runs across a "Canadian drummer." On the other hand, I can say this as regards sales (I will put it in percentage as it sounds better), that 100% of the Canadian salesmen who have to my knowledge come to Japan during the last two years, have done more than clear expenses. Besides taking home some good business, they have gained an intimate knowledge of the requirements for selling their goods in Japan, they will know what to do and what not to do when they return home, and they have probably made

Interior of the Canadian Trade Commissioner's office at Yokohama

* Have already been exported to Japan from Canada in small quantities.

connections which will result in good business in the future. Members of the C.M.A., where are your salesmen? See to it that hereafter they include Japan in their itineraries.

Quotations, Samples and Catalogues

I said that without branch houses in Japan, and without the personal visit of the salesmen, it is very difficult to do business, but it can be done sometimes by the sales manager of a firm who sits in his office at home and tries to convince some firm out in Japan of the merits of his goods by correspondence. This is a mighty poor substitute for getting business at its best, but what makes matters worse is that some of our enthusiastic exporters do not even cover the ground properly by correspondence.

1. They may send purely a letter telling what they make and have for sale, but quoting no prices and sending no catalogues. This kind of letter is useless, and will probably not even elicit a reply.
2. They may send a nice letter, giving full particulars of what they have to offer, but quoting f.o.b. factory, and do not send catalogues or samples. This letter is almost useless, but may receive a reply.
3. They will give full particulars and c.i.f. prices Japan, but no samples or catalogues. This letter will get a reply, but it will be one asking for samples or catalogues immediately.

How to Get Business by Correspondence.

1. You should at least quote f.o.b. Vancouver prices, but, better still, c.i.f. Japanese ports.
2. You must tell what the best deliveries are which you can make, the quantity at one time, and how often.
3. You must send full particulars as regards packing, size of packages, weight of same packed.
4. You must submit a sample, or, if not practicable, catalogues, analysis or something to show what the article is like.
5. In short, you must be prepared to please your customer, cater to his requirements and give him exactly what *he* wants, not what *you* wish to give him.

Packing

I have sometimes had complaints from Japanese importers about poor packing. This is a most important feature about export business; indeed, I have heard it said that export packing is an art in itself. And I suppose you are the ones who should know it!

When you pack for export, to exaggerate a little, I will say, always pack with the idea of making your case or whatever it may be, absolutely unopenable, unbreakable and, if you like, watertight. If your case of goods is destined for Japan, pack it strong enough to go to Japan and back again. This is one of Britain's strong points—her packing is well-known in Japan. If a British manufacturer is sending say a lathe to Japan, he will probably make his case of 1½ to 2-inch lumber, whereas 1-inch might possibly do just as well. But he runs no chances—and this is a good motto for us in packing, "Take no chances." In packing for Japan, do so knowing that your case is going to be handled roughly, that it is probably going to be dropped and banged until doomsday.

A few months ago I saw a piece of Canadian machinery unloaded; when in the air being hoisted over the ship's side, part of the case gave way, and the machine fell, I think it was ten feet. The result was that the machine was picked up in 127 pieces, and I know from the importer's point of view that was only the beginning of the trouble.

Canadian foodstuffs should be particularly well packed to insure that the cases cannot be pilfered or broken.

Marking and Invoicing

Another point which Canadian exporters do not seem to understand is that all cases should be numbered, the number of the case to correspond with a number on the invoice, showing exactly what is in that case. This applies especially to small things like groceries, where there may be several kinds of packages in a case of goods. If such a case were No. 1, then on your invoice No. 1 case should be shown and also just what that case contained. If you don't do this, every case has to be opened and examined at the Customs, which may mean that if there are seventy-five cases your consignee won't get his goods for two and most likely three weeks later. I had one instance happen like this last Christmas; the cases were not numbered, and there were no numbers shown on the invoice form, and as a result each case had to be opened in the Customs, the consignee missed the goods for his Christmas trade, and he cursed Canadian export methods and the Canadian Trade Commissioner, who introduced him to the shipper in Canada, particularly as he had sent them explicit instructions how to number them to correspond with numbers on the invoice.

Grading

Then there is the question of grading. Such stuff as asbestos and paper pulp, of which there may be two or three different grades, should always contain the proper brand ordered. I sometimes get complaints that second and third-grade pulp is found packed in with what is supposed to be all a first-grade product. This does not do. Although it perhaps is quite accidental, it gives our importer the impression that somebody is trying to slip something over him. And this brings me to my next point.

Goods Sometimes not up to Sample or Specification

If there is anything which is apt to spoil the good name of Canada it is where goods are shipped to Japan which are not up to sample or specification. I won't dwell any further here except to say that I regret very much that certain Canadian firms have been at fault here. I have seen samples of steel—supposed to be mild steel bars, but which turned out on arrival in Japan to be wrought iron bars. Other complaints of a similar nature have been received.

I have heard of other countries doing tricks like this, which you would almost think impossible,—things which have any trick that Japanese exporters have done, beat a thousand ways.

Now, we must build up our business in Japan on quality of goods shipped. British goods in Japan have the reputation for quality, let us not fall behind.

Make Prompt Deliveries

Another complaint I have received, although not lately, was that Canadian firms had fallen down on deliveries. That they have not delivered the goods when they contracted to deliver them.

A certain country has made a very bad reputation for themselves in the East, by taking orders for goods and promising deliveries which they knew at the time they could never adhere to. British firms, if they cannot deliver a machine for a year or two years, they say so, and the Japanese importer knows this and can count on getting his goods at that time. We must be on the alert in this respect also. When travellers come out to Japan to sell goods, they must be able to tell when delivery can be made. This reminds me of a salesman from Toronto who was out in Japan recently. I loaned him my Commercial Exhibit Room, where he was displaying his goods. It happened that one day he was out when a customer came in. So I went in and talked with the customer instead. I started off by saying that this was a Canadian company, and that he must not get it confused with any other. In talking about the question when delivery could be made, I referred to the fact that certain travellers from other countries promised quick delivery, al-

though they never delivered the goods on contract time, but that Canadian firms never did this. That Canadian firms were British firms and told the truth and promised nothing they could not fulfil. Just then my Canadian friend came in, so I retreated to my own office. In a little while he followed me to my room, and one of the first things he said to me was, "Darn it all; I promised July delivery to that fellow, but I know we can never do it." After the assurance I gave this Japanese I hope that I am still in Canada when that July delivery is supposed to take place.

Lack of Appreciation of Japanese Market

One reason why our exports to Japan have been so small up to the present is the fact that Canadian business men don't seem to appreciate the potentialities of the market. They have not studied the people and the conditions under which they live.

How many of you, for instance, have an accurate idea of the expense sheets which your best salesman is going to turn in when he returns from his trip to Japan next month, next year or whenever you can get him off. Do you know that the cost of living in Japan is higher than it is in Canada to-day? Do you know that in the hotels we have to pay as high as 45 yen a day for a double room with bath? Do you know that butter is $1.10 per lb., beefsteak 50 cents a lb., fillet of beef 75 cents a lb., sugar 30 cents a lb., and so on? Do you realize that a Japanese outfit of clothes costs as much and more than our own does? Do you know that the little entertainment which one of your clients will give you at a Japanese geisha house from 7 to 11 p. m. some night will cost him about 100 yen, and that if your salesman gives a similar party to any of his Japanese, that it will cost him twice as much.

In other words, the spending power of those Japanese you are dealing with is high. The middle and upper classes of Japan to-day could live in Canada just as well as in Japan, as far as the cost of living is concerned. Don't get into your head the idea that there is only a market for cheap goods in Japan. Remember what I said about the pianos.

Prejudice Against Japan

Another phase of the situation which I am often asked about and which I know is a deterrent factor in our relations with Japanese importers is the question of the reliability of the Japanese trader.

You probably have often been told that in Japan the trader occupies a very degraded position amongst the community; in fact that he ranks at the bottom of the list. This statement although true in the past, is not true to-day. Formerly there was in Japan what they called the "Shi-no-ko-sho" or the order of precedence. First came the warrior, then the farmer, third the artisan or artist, and finally the trader. To-day the militarists are still ranked as coming first, although they have not quite as much administrative power as formerly, but are struggling hard to hold on. However, this has nothing to do with my subject. But after the soldier now comes the trader and the best brains of the country are now occupied in commercial and professional work. Business is no longer looked down upon. The Japanese now is a money maker.

At first, as I said, the trader was very low in the social scale. For this reason it was quite to be expected that he would have no compunction about getting his money by hook or by crook. However, after Japan was opened up to foreign trade, and the Government saw the advantages of commerce, they did everything possible to encourage the best people in the country to take up a commercial life. As a result we have such old established firms as the Mitsuis, and Mitsubishi, firms which to-day are worth millions. Of course there is the small unreliable firm also, but they are to be seen in any country. Yes, and a few such firms in Canada have made themselves notorious in Japan through their crooked dealings. But on the other hand there are many well-established Japanese houses that have built up a big business on modern lines and on correct ethics and principles. Of course there may be an occasional Canadian who has received a bad shipment from a Japanese firm or you may have sold goods to one who has not accepted your draft when presented, but this also occurs in any country. Canadian firms have been known to do the same thing; in fact, I keep a file in my office entitled "Complaints against Canadian Firms" in which I have two or three such cases, but such firms are usually houses which should have been avoided in the first place.

Make sure who you are dealing with before you commence operations. Financial reports can be obtained on any firm in Japan, just the same as they can in this country. If you will communicate with my office, we will gladly get you a financial report on any firm you are about to sell to—although of course we can take no financial responsibility for such firms.

I think much of this prejudice against Japan and its traders is due to the Japanese laborer. This is B. C.'s problem, and it is not for me to discuss, but we must remember that the Japanese importer and the laborer are two different propositions altogether. So don't be prejudiced in one case on account of what you read in American or Canadian papers *re* Japanese labor. Study the matter out for yourselves, and consider it purely from a business standpoint. If your Japanese client is reliable, why should you not sell to him just as much as to your South American or other clients?

What we must do to Increase Our Sales in Japan

If you are to increase your business with Japan, you must first of all change your whole plan of attack from the present incomprehensible to a more businesslike, practical and thorough-going system.

Salesmen

You must first of all send out your best salesmen. Better still, you yourself should go to look after the ground. Let your best salesman go the next year.

Go prepared to stay a month if necessary. You cannot do things in Japan nearly as quickly as you think you can and as you probably will plan to do. About two-thirds of your time will be taken up with useless talk about the weather, and the other one-third you may talk business. The Japanese are slow to make up their minds, particularly if it's a new brand you are trying to introduce. You must bring full samples of samples, prices, and be able to give complete information as regards deliveries, etc. You will meet many different buyers and must be on the outlook for the best man to represent your firm and the best way to handle the business.

Canadian Branch Commission Houses

We must have a dozen or so really good, live houses in Japan—branches of Canadian firms—to push the goods which you manufacturers with to sell in Japan.

Such houses can be purely import houses or they can export Japanese goods as well. But they must be well financed financially, particularly for the import business. In the first place, the running expenses of an office now are very high.

Your Canadian manager should receive at least 1,500 yen a month. But if the business were a large one and the responsibility heavy, he should get more. He also should get a small commission over and above a certain set value of annual business done.

The manager of your Paper and Pulp Department will receive at least 1,200 yen a month, plus a commission. Rents are high, running from 250 yen to 1,000 yen per month —depending upon size and location.

Your stenographers will want 400 yen per month.

Your bantos (or salesmen) must be paid yen 100 to yen 250 per month, depending upon their experience, plus a small commission on the business they turn in. Then there are other expenses, such as taxes, travelling, etc., etc.

Another reason why an import firm should have good financial backing is that it can do better business if they have a warehouse or showroom and can carry stocks of standard goods. You can figure on getting from five to ten per cent. more for spot goods in Japan, because when your Japanese friend wants something, he wants it right away—and would rather pay a little more for it than wait and take the chance of the market falling, etc., etc.

To my mind, the best way of handling export business in Japan is to accept orders on a basis of 25 to 30 per cent. cash. Then if the purchaser does not accept the goods when they arrive you will be covered with the initial cost paid and could sell the goods to other purchasers.

Japanese firms usually prefer to supply an irrevocable letter of credit, or, as they call it, "letter of credit, form B." This, of course, is just as satisfactory, as you are fully protected. But these two methods are the only reliable ways of doing business, and particularly so for a new firm, which has not the long years of acquaintance with Japanese buyers.

A Dock Scene at Yokohama

Showing one of the big C. P. O. S. Trans-Pacific Liners Docking

Foreign Agents

If you do not have your own man on the ground, and if you have no Canadian houses to handle your goods —then you must either fix up an agency with a Japanese firm or with one of the foreign commission houses already located there.

This arrangement may be quite satisfactory if you are lucky enough to find a good firm which does not already represent a similar line.

But there are some disadvantages. A British house, for instance, will naturally take more interest in things which are produced in the British Isles than in any other imported goods. If he cannot get a thing at home, he will then gladly consider Canadian goods in preference to any other. We must remember that we compete with the Mother Country in Japan, the same as we do with the United States or any other country. Business is business wherever you go and you cannot get away from that fact. Of course, once a British house takes up a Canadian line, he will back it up just as much as any of his other British goods. But the fact is that these British houses are nearly all old, well-established firms, and that as far as sole agencies are concerned they are already booked up with firms in the British Isles. This, of course, applies in a different way to other houses, American, French, etc. They naturally are not so interested in our goods as British houses would be, and they are all out there pushing goods usually made in their own country. Although during the war it was a case of getting the goods from whatever source possible, and this is still more or less being done.

With the Canadian import houses you get the personal and patriotic element—and this accounts for a lot these days, not to speak of the intimate acquaintance with your local Canadian conditions, goods, manufacturing and shipping facilities, etc., all of which would result in a better understanding and better working arrangements.

Export Associations

I think that a satisfactory business might be done if certain manufacturers would group together for export business. I don't mean this in a general sense, but three or four large Canadian concerns who do not make similar goods but affiliated lines—would join hands in sending a man out to open an office.

Take, for instance, iron and steel—there might be one firm who made iron and steel bars of all kinds and structural steel. Number two firm might manufacture nails, bolts, screws, etc. Number three firm would specialize in iron and steel ware. Number four firm might make steel and iron pipes—and so on. One man could well represent all these firms impartially, yet each firm could contribute so much to the maintenance of his office in Japan.

This could be done in a bigger way—that is an iron and steel, chemical, food product and lumber manufacturer could get an all-around man to go out and open an office for them. He would have to have Japanese bantos for each line, but he could attend to all sales, etc., himself.

This is only a suggestion, but it is being done right along in buying goods from Japan. Men come to Japan representing, say, four or five of the big department stores located in different cities in the United States. He buys for them all, thus saving them considerable expense, etc. Each of them pay him, say, $200 a month; this allows for a good man and at the same time is much less than they would have to pay a sole representative. Why can't this be done in export business? I think it can; but it needs Canadian initiative and co-operation, and I know you can do it very easily if you set about it.

Samples, Prices and Catalogues

After what I have said before this evening, it is unnecessary for me to again remind you that when you have your arrangements made for representation in Japan, you must keep such fully supplied with all date relating to prices—c.i.f. Japan. These prices should hold good for, say, two months, so that your agents could sell firm without any preliminary cabling, correspondence, etc. As I pointed out before, you would have a general understanding with your agent that he was to demand a certain percentage of cash with order. Then you would be fully protected. The purchaser would pay balance on delivery of goods. If he revoked, you could then sell to somebody else without loss.

Canadian Trade Commissioner's Office

Canadian Trade Commissioner's offices *have* been known to be of some service in introducing a manufacturer's goods in a foreign country. I have sometimes seen newspaper reports of some Canadian's visits to a foreign country in which he perhaps takes quite a whack at the dilapidated, unbusinesslike, medieval and stick-in-the-mud fashion in which some Canadian Commissioner's offices are conducted. I receive some dozen Canadian newspapers regularly, and I always glance through them eagerly to see if I can find my own "death knell." However, I might add that such remarks come usually from some one who is out to buy goods. These people don't seem to understand that the Canadian Trade Commissioner service is established for the promotion and extension of Canada's export trade, and that we have no machinery at our disposal for encouraging foreign competition with Canadian manufacturers. I say we can sometimes help to sell Canadian goods—but only if we are fed properly with samples and full particulars, etc.

In my own case, I might say that in nine cases out of ten Canadian firms, in sending catalogues or prices, quote f.o.b. factory. This is as good as useless. Japanese buyers want to know how much the goods are going to cost them laid down in Japan. It is almost impossible to figure it out at our end. We can get the steamship freight rates from Yokohama to Vancouver, but it is impossible to get accurate rail rates. I have tried, Japanese buyers have tried, and the best we can do is to get the freight rates which were in vogue say three or four months ago. The steamship people will tell you, "We don't know if they have changed or not recently." But we cannot do business on conjecture. You are probably selling to a party who have an inquiry for the goods from a third person. Your buyer must know the c.i.f. price because he is going to make a contract with his client, and if he does not know exactly the c.i.f. cost he stands to win or lose.

Can you not, therefore, see that it is absolutely necessary to have a c.i.f. cost? Please don't ever write to my office quoting f.o.b. factory. It is useless, it is a waste of time and money, and you can assure yourself beforehand that no business will result.

Then you must have samples; also, the first date delivery can be made. With these particulars we can go to an importer and say, "Here are the samples. These goods will cost you such and such delivered. Are you interested or are you not?"

Small Profits and Big Turnover

To compete on the Japanese market you must keep your prices down to the minimum. During the war materials brought ridiculously high prices; but these times have passed. Competition is now keen and we must be content with less profits. Some firms doing an export business in Japan, taking advantage of a big demand, charge excessive prices. That is, they take the money while the going is good. These firms, however, do not create a good impression and by doing this probably kill their future business. Be content with a small profit, but only a big turnover.

When introducing your lines for the first time be prepared to meet the competition of another brand, no matter whether you lose money at first. In other words, put your loss down to advertising.

A few months ago samples of a Canadian article were received at our office. They were shown to one of the biggest firms in Yokohama. These people were interested, and taking the samples showed same to their various clients. The goods were tested and found to be the equal of a similar American product, while the prices and discounts were exactly the same. Owing to the fact that the American article was well known on the market, users would not buy the Canadian brand, even though they knew the quality was just as good, unless there was some further inducement in the way of a little lower price. So I wrote to the Canadian firm asking them to accept just a slightly lower quotation for the first few shipments in order that their goods might be introduced. On the other hand, the Yokohama firm sent in a trial order and said that they would give them away if the Japanese firms would not buy them, just to get the new brand known. This is the way we want to look at these things. The commission house, being interested in the goods was game enough and enthusiastic enough to lose money over the first transactions. Are you willing to meet them half way and stand a slight loss in order to find a permanent market? The day before I left Japan I received an answer from the Canadian firm in question, in which they said: "We are in receipt of your very kind favor of February 26th, and this letter shows us that you have been to a great deal of pains and trouble to represent this industry, and we certainly appreciate the attention you have given and the fairness with which you have undertaken this work. We will, we assure you, do our part also."

Delays in Correspondence

Another thing which Canadian firms don't realize is that it takes time to send letters and cables to Japan and get a reply thereto. This often results in misunderstandings. You may write to a firm offering them the agency for such and such a line and ask them to let you know immediately whether they wish to take it on. In your letter you give your client full information as regards the article. You count on hearing from him, say, in six weeks. In the first place, your letter may be delayed. It may reach Japan on time, but get lodged in a Japanese post office for a few days or even weeks. He eventually gets your letter and replies in the affirmative. You, not hearing from him when you think you should, consider that he is not interested, and may make arrangements with another firm. In the meantime the original recipient of your letters considers that he has your agency and begins to sell the goods and probably makes a few contracts. You can easily see the complications that develop. This has happened two or three times to my knowledge, and I am sure that there must be many other similar cases. The same thing applies to cables. They are more often than not received in mutilated condition and have to be often repeated—which takes times. Sometimes they are not received by the firm in Japan at all.

Always Acknowledge Your Correspondence

Another matter I should mention with reference to correspondence is the acknowledgment of enquiries. Japanese or foreign firms in Japan write to Canadian manufacturers about getting some of their lines, and never receive a reply. This often happens; indeed, I myself could name a few prominent manufacturers of Canada who are guilty on this score. Always answer your foreign correspondence, no matter if you are interested or not. It only costs you five cents while the value to the good name of Canada cannot be estimated. We don't want Canadian firms to get the reputation of being neglectful and careless, and one firm can do a lot of damage, so I hope you will all co-operate in this respect.

Postage to Japan

I said postage to Japan is five cents. Every mail that comes into our office from Canada brings in twenty c

hirty letters with only three-cent stamps. This means we ıust pay eight sen on each letter. Strange to say, the newsapers seem to be the greatest offenders in this respect. I enerally, when answering these letters, try to make a sarcasic remark, "Please advise your mailing clerk that postage o Japan is five cents, not three,"—but this usually does not take hold." However, this is one of the preliminary points n export business in which there is no excuse for making mistake, particularly as it makes a bad impression with the apanese when he has to pay for a letter he receives, as he, f course, thinks the correspondent must be a small one nd new in the exporting arena.

Transportation

As regards inland transportation, you know better than I o if there are any improvements that could be made to facilitate export shipments. Everything possible should be done o rush export freight to the seaboard. Through bills of ading should be issued and issued in such a way that they an go forward on the same vessel as the freight. They hould be issued by any railway company and subject to cean transportation by any vessel upon which first reight space can be secured. That is, the goods should not e held up at a port waiting some particular boat when other essels are going out upon which the goods might be shiped. One of the most frequent complaints I receive from apanese importers is that Canadian goods have arrived, but ith no invoices. This means great delay to the consignee t getting goods cleared through the customs.

Branches in British Columbia

But by far the best way, the easiest, and the most prac-ical method of increasing our exports to Japan (and this a feature of my address which I hope you will ponder over ad remember, even if you do not sympathize with any of my marks made so far), I say by far the most practical way increase our sales to Japan is to build branch plants in ritish Columbia. Here you are on the Pacific seaboard, here there are plenty of fine factory sites to be had. Think w much easier it would be to load vessels right at your n docks; think how much better you could handle your ipments to Australia, New Zealand, China, the Strait Settments, Sumatra, Java, and the other Dutch East Indian lands, India and Japan. Here you have a market comprisig about 350,000,000 people—all of which can be handled m this province, much better than from any other part of nada.

Have you ever thought about the enormous possibilities o this province for trans-Pacific trade? Do you know about th wonderful natural resources of this province? Do you kow that there are supposed to be 22,595,200,000 tons of coal i British Columbia? That there are very large deposits o iron ore and limestone—all in close proximity to the coal mes? Consider the other side of the picture—do you remmber that I said Japan was starving for steel of all kinds, tt she would take all the surplus supplies of a British Cumbia steel industry? Let me read what Mr. Watson Gffin says about this province in his book, "Canada the Cntry of the Twentieth Century."

British Columbia is a Manufacturing Province

The farms, forests, the mines, and the fisheries of British Columbia will give employment to a large population, bu one of the most important industries of the future will prbably be manufacturing. With numerous water powers, grat supplies of coal, all the metallic minerals, and immense fosts of the finest timber, no country is better suited for iron-making and wood-working industries, while the climate is especially suited to the manufacture of textiles. It is well-known that a moist climate is most favorable to the successful manufacture of the finest grades of cotton and woollen goods, and there are many points along the coast admirably suited to textile manufacture. Immense areas of land are suitable for sheep raising. Raw cotton can be imported from the Southern States, Brazil, Australia or India, and wool from New Zealand.

Yes, British Columbia has the makings of a wonderful manufacturing province and we want the co-operation of all you manufacturers to make it so. My friend, Mr. Davidson, the Industrial Commissioner, will gladly give any of you full particulars *re* advantages of Vancouver, and he will be delighted to take you around to look over possible sites. For my part, I will be ready to co-operate with you at all times. Therefore, gentlemen, locate your branches in British

Canadian Banks

Another most important link in the chain of export essentials, is the bank. Until a year ago there was no Canadian institution of this kind in Japan. But now, next door to the Canadian Trade Commissioner's office in Yokohama, you will find the Park-Union Bank, which as you know is a combination of the National Park Bank of New York and the Union Bank of Canada. This bank is manned chiefly by Canadians, and I may say that its establishment in Japan has proved a great success. Too bad it did not locate there a couple of years sooner. They have branches in Yokohama and Tokyo and are soon to open in Kobe.

It seems to me that there is room for another real Canadian bank in Japan—one which is not affiliated with even an American institution. The bank is a good advertisement of the country it represents. It stands for something which cannot be advertised in any other way: the financial security of Canada. Why should we not have our banks in Japan? Is there any good reason? We have them in other small countries and islands, and here in one of the first five powers of the world there is only one. Of course, all your banks will tell you: "Well we have our own agents in Japan"—Japanese banks and other foreign banks. What good does that do Canada compared with a visible Canadian institution. Canada is never heard of through these Japanese bank agencies—what interest do they take in us? Yes, the bank is the greatest foreign trade propagating influence there is to-day. Look what an important place German banks occupied in the foreign trade of that country. The Deutch Asiatic Bank has one of the finest bank buildings in Japan to-day at Yokohama. What a good thing for Canada it would be if the brass sign on that building could be replaced with one bearing the name of some good Canadian banking institution. Our banks must keep up with the times. They must take the lead in directing the channels through which our trade is to flow. Indeed, Tennyson should have said: "More things are wrought by banks than this world dreams of."

Difficulties Under Which Foreign Firms in Japan Operate.

Sometimes you may appoint an agent in Japan and find that after a year or so the business returns are not as great as you think they should be. Now, in fairness to these foreign houses in Japan, who are all competing for Japan's trade—doing a mighty and a noble work for their respective countries—I would like to mention some of the difficulties which they have to contend with. But in my capacity of Canadian Government Commissioner it is not for me to criticize the public services of another country.

Japanese Government Encourages Home Manufacture

Japan is a highly protectionist country and in many cases the duties on manufactured articles are levied on a basis of from 35 to 50 per cent.—the duties being specific. Raw materials are generally free, while semi-manufactured articles pay a low rate of duty. In the case of export goods there is an elaborate system of drawbacks.

My friend, Mr. Crowe, the British Commercial Secretary, figured it out that owing to the general advance in the value of goods and to the growing proportion of imports of raw materials, and semi-manufactured articles, the average *ad valorem* rate of duties on dutiable goods had been generally falling. So that in 1913, although it amounted to nearly 20 per cent., by 1918 this rate had dropped to 8.25 per cent., while if non-dutiable goods were included the rate in 1913 which was 10 per cent., had dropped to only 3.79 per cent. in 1918.

Besides encouraging the production of goods at home by a high tariff, the Japanese Government also helps in other ways—in many cases it actually controls the industry—having advanced the money for its organization. There are also different industries which receive Government subsidies. On the other hand as I mentioned before, in all Government contracts the general policy is only to use domestic manufactured goods—such for instance as asbestos goods, paint, etc. It also maintains experimental stations where experts trained abroad carry on experiments and help to get new industries started.

Government Monopolies

For your information I might mention that the Japanese Government operate all the railway, telephone and telegraph services. It also has a monopoly in the handling of camphor, salt and tobacco. The tobacco monopoly profits amounted to 72,967,800 yen in 1918, the salt monopoly to 7,460,300 yen, and camphor (crude and oil) to 938,760 yen, while the profits upon the Imperial railways amounted to 66,262,980 yen in the same year.

Trade Mark Registration

I feel that I should say a word as regards trade marks. You probably often hear of firms having trouble in Japan over the imitation or piracy of their trade mark by Japanese firms. Although this is not so common now, as in the past, I regret to state that instances of this are still quite prevalent.

There is a Trade Mark Law in Japan, as in other countries which have adhered to the International Convention, for the Protection of Industrial Property (1883). Canada (as a Dominion), although not a party to this treaty, is entitled to all the rights in respect of patents of inventions and trade marks secured to British subjects generally under this treaty. Canada had an agreement of her own with Japan under the Treaty of 1894, but this treaty was denounced by Japan which wished to have a treaty drawn on new lines. But the matter seems to have been allowed to drop as nothing further has ever been done in the way of forming a new treaty.

The chief point of difference in the granting of patents in Canada and in Japan is that Japan recognizes the priority of registration, while with us it is the priority of user which is the determining factor.

It is therefore most important that before a Canadian firm even introduces a new line on the Japanese market that they should see that their trade marks are registered.

You will run across many things in Japan, which at first sight look like an imported article—but in picking it up and examining it carefully you will see a misspelt word on the label. There is probably as many brands of "Genuine old Scotch whiskey" sold in Japan as in Canada (no, I won't say Canada or America, but the United Kingdom). This is nearly all made in Osaka, so that the phrase "Osaka Scotch" has come to mean now amongst the foreigners in Japan—"a bad imitation."

Most of such imitations are done by very small concerns, and usually are confined to such articles as can be produced with small capital—such goods as soaps, perfumes, biscuits, confectionery, sauces, etc.

It is to be hoped that this matter will be given more attention by the influential men of Japan, and that laws will be passed which will make the punishment so severe for these trade-mark pirates, that they will not try it a second time. At present the punishment is very mild indeed, so mild in fact that a good Canadian brand on the market before registration is in great danger of being imitated. So, have your trade marks registered!

Fees for Trade Mark Registration

For your information the fees for registration are as follows:—

1. Y3.00 upon application.
2. Y20.00 upon registration.
3. Y10.00 upon assignment.
4. Y2.00 upon application for renewal.
5. Y20.00 upon renewal.

Japan as a Competitor

You have probably from time to time encountered Japanese competition both in your domestic business and in foreign territories. I am sorry that my time does not permit me to dwell at length upon this important subject; I would just mention a few pertinent facts, however, to show you that you need have no serious apprehensions as regards competition from Japan:

1. Most of the things manufactured in Japan are of a class which we don't make in Canada.

2. In regard to such manufactures which are common to both countries, may say that the costs of production are increasing very rapidly and that the quality of Japanese goods usually is inferior compared to Canadian manufactures. Japan manufactures for a cheap trade, she supplies low priced articles which were formerly made by the Huns. Her best product—silk—is not made in Canada, and therefore does not compete with us.

3. Many of the markets found by Japan during the war are now being lost, owing to the fact that countries are getting back to their old sources of supply. The Japanese themselves realize this, and both Government, manufacturers and exporters are doing their best by amalgamations and consolidations to strengthen their position.

Cost of Production

I just referred to cost of production. Perhaps the following figures, which were supplied me by the Osaka Chamber of Commerce, will be of interest as showing the wages received in March, 1919.

To get the approximate wages of to-day, I think we should add another 20 per cent. It must also be remembered that textile workers get their board and lodging in part payment.

Kind.		March, 1919.
Flour miller	Men	.40-1.75
Cotton spinners	Men	.35-1.69
	Women	.25- .76
Woolen cloth weaving mill	Men	.48-1.42
	Women	.30-1.10
Iron forger (shipbuilding)	Men	.43-2.60
	Women	.35-. 45
Glassmaker	Men	.60-1.60
	Women	.30- .35
Cement worker	Men	1.04-2.65
	Women	.41- .67

News From the Tariff Department

Board of Customs Decisions—Various Rulings Made as to the Duty Applicable on a Number of Commodities

JUTE WEBBING, plain, per sample, declared to be dutiable under tariff item 546 at the rate of 10%; and jute webbing, colored, per sample, declared to be dutiable under tariff item 538 at the rate of 25%.

Toluol and Xylol, declared to be subject to duty under tariff item 711 at the rate of 17½%.

Pyro Putty, per sample, exported by the Pyro Products Company, Chicago, Ill., consisting of two fire clays and ganister, mixed with water, declared to be entitled to entry under tariff item 295 as free of duty.

Betson's Plastic Fire Brick, exported by the Betson Plastic Fire Brick Co., Rome, N.Y., consisting solely of a mixture of fire clays and water, in a plastic state, declared to be entitled to entry under tariff item 295 as free of duty.

Oval butted iron pipe, per sample, when widest diameter not over 1½ inches, declared to be entitled to entry under tariff item 397 as free duty.

Hollow oblong metals of sheet steel, per sample, for the manufacture of loose-leaf binders, declared to be dutiable under tariff item 454 at the rate of 30%.

Wooden spools or reels, per sample, used as containers for importing tin foil, enamelled wire, etc., such as are returned to exporter for re-filling purposes, declared to be dutiable under tariff item 506 at the rate of 25%.

The following publications of the American Baptist Publication Society, declared to be entitled to entry under tariff item 172 as free of duty, viz:—

"Keystone Primary Stories,"
"Beginners' Course."
"Primary Course."

Silk in the gum, or spun silk, imported for the manufacture of hosiery, declared to be not entitled to free entry under tariff item 577, as socks and stockings are not considered "underwear" (in effect from 2nd June, 1920).

Zinc circles, 9-3/16 inches in diameter, per sample submitted, declared to be dutiable under tariff item 346 at the rate of 25%.

Copper in bars and rods, when imported for use in the manufacture of edgwise winding for electric motors or generators, declared to be dutiable under tariff item 348(c) at the rate of 10%.

"Ark Safe" brown paper bag linings, per sample submitted, declared to be dutiable under tariff item 193 at the rate of 27½%.

S.S.W. Dental Equipment Stand No. 3, per catalogue illustration submitted, imported by S. S. White Dental Manufacturing Company, declared to be dutiable under tariff items 453 and 453(a) at the rate of 27½%.

Ritter Dental Equipment A.C. Unit, per catalogue illustration submitted, declared to be dutiable under tariff item 453 at the rate of 27½%.

Steel screws, per samples, for sewing machines, declared to be dutiable under tariff item 413 at the rate of 35%.

Dryers and crushers for preparing coal for the mixer in connection with the manufacture of fuel briquettes, declared to be dutiable under tariff item 453 at the rate of 27½%.

Re value for duty of building plans and blue prints. Decided that section 2 of Appraisers' Bulletin No. 152 be amended by striking out the words, "One per cent." and substituting therefor the words "Two per cent."

Departmental Rulings

Monopole oil, per sample, ruled to be dutiable under tariff item 711 at the rate of 17½%. This ruling will therefore cancel ruling on Monopole oil in Bulletin No. 630, page 21.

Dyflake, imported by F. W. Woolworth Company Ltd., from the Dyflake Manufacturing Company, of Brooklyn, N.Y., ruled to be dutiable under tariff item 246 at the rate of 22½%.

Powdered wax for dancing floors, ruled to be dutiable under tariff item 252 at the rate of 27½%.

Boiler superheaters are rated for duty under tariff item 454, as "parts" of boilers are not provided for in item 453. Wrought or seamless iron or steel tubes for boiler superheaters ruled to be entitled to entry under tariff item 395 as free of duty.

New Australian Tariff in effect March 25th last makes wheat, wheat flour and semolina dutiable when imported from Canada. Similar products when imported into Canada from Australia would therefore now be dutiable,—wheat, at the rate of 12 cents per bushel under tariff item 60(a), and wheat flour and semolina, at the rate of 50 cents per barrel under tariff item 61(a).

Excise tax on imported automobiles adapted or adaptable for passenger use. The excise tax is 15 per cent. of the customs duty paid value when the home consumption price to consumers (including the United States excise tax), plus the actual customs duty payable on entry is $3,000 or less each, and is 20 per cent. when over that amount.

The following Chain Blocks are now manufactured in Canada, and such articles are therefore not admitted under tariff item 470 as free of duty, when imported for the equipment of ships and vessels:

Triple gear type up to and including 20 tons capacity.

Spur gear type up to and including 5 tons capacity.

Spur gear type (electric) up to and including 2 tons capacity.

Travelling spur gear type up to and including 5 tons capacity.

Worm gear type up to and including 30 tons capacity.

Travelling worm gear type up to and including 20 tons capacity.

Gravity lowering worm gear type up to and including 5 tons capacity.

Differential type up to and including 3 tons capacity.

Architects' Plans and Blue Prints

The Department of Customs has cancelled the former instructions re Architects' Plans and Blue Prints and has issued the following rules for the guidance of its officers in the entry and appraisement of such plans.

1. The rate of duty on Drawings, Blue Prints and Building Plans is 22½% ad valorem under tariff item 180. Specifications, however, are free as "manuscript," when written or typewritten.

2. Special Plans of Building, or blue prints as substitutes therefor, are to be valued for duty at the charge usually made by the architect for the drawings, without the specifications. This charge may be fixed for duty purposes at two per cent. of the estimated cost of the building to be erected.

Detailed drawings, or blue prints as substitutes therefor, if imported separately, to be appraised at a valuation of two per cent. of the estimated cost of such detail.

3. When the building is estimated to cost less than $10,000, the plans or blue prints thereof may be appraised at the usual charges for furnishing same, according to the special circumstances in each case irrespective of the preceding rule (No. 2).

4. Blue Prints or copies of Building Plans may be admitted at the cost of production when duty has been once paid on the original or a copy thereof in Canada under the foregoing rules, upon proof of such payment to the satisfaction of the collector at the port of entry.

5. Blue Prints of cars and machinery, being copies of standard designs, may be valued for duty at 75 cents per pound.

Competitive Plans for Exhibition.

6. Competitive Plans brought in for inspection may be entered as for warehouse and inspected under customs supervision, subject to payment of duty within 60 days unless then rejected and ex-warehoused for exportation.

Steamship Sailings

Proposed Sailings from Montreal, Quebec and Vancouver, Subject to Change Without Notice

FROM MONTREAL.

To Liverpool.

*Empress of France	C.P.O.S. Line	Ab't	Sept.	8

Boys' and Girls' Clubs in Manitoba

(*Continued from page* 88).

vegetables. With an increased interest in vegetables canning has developed and last year there were 5000 exhibits.

The mention of exhibits implies a club fair. All the clubs conclude their season's work with a fair where prizes are offered for the best exhibits.

Such a fair with prizes is a great benefit to a club as it rouses competition and stimulates interest. It is natural and commendable for a boy or a girl to want to do well, to excel in doing it, and to be glad of praise. Because the fair is merely to introduce a competitive element into the club work, the fair or the prize should never be placed before a member as his aim. So large cash prizes are inadvisable. A prize list should cultivate a natural spirit. If too much emphasis is laid on the fair and the exhibit, and the child enters only to win a prize much of the value of the fair is lost. The important thing about the club work is not the fair but the project itself. The fair is only the consummation of earnest, careful work carried on throughout the summer. In this work the boys and girls need supervision from enthusiastic, trained leaders. Such leaders should be people of the community who are interested in the boy and the girl and are able to help them on specialized lines.

The fair, fulfilling its purpose, brings the best work of the different club members together. By such an exhibit the real scope and the nature of the club work is brought home to many who have been merely onlookers. The fair is in itself an education, for here club members can see the best and get to know the best products in various lines, and so can establish ideals for which to strive. One member of the Virden Boys' and Girls' Club said, "I was disappointed when I saw that my buds did not win the prize, but I decided to find out why they had not won it and whose fault it was. My losing the prize made me more determined than ever, so I started twelve months before the next fair day to prepare my work." The next year her buds won first prize.

The Boys' and Girls' Club work has become so popular that the T. Eaton Company and the Manitoba Bankers' Association, co-operating with the Department of Agriculture, have for the past few years provided special trips to Winnipeg for boys and girls who won in certain projects. This year the T. Eaton Special is a trip for one demonstration team out of every two inspectorates. These teams will be taken to Winnipeg for one week where they will compete for Provincial honors and also go sight-seeing. The trip provided by the Bankers' Association is for the encouragement of live-stock projects. Any member of the local club securing the highest score in calf and pig raising, provided there are at least six contestants in either class, is eligible for this trip. In Winnipeg these members compete in live stock judging.

Such trips stimulate a greater interest in club work among boys and girls. The trip brings members from various clubs together. It broadens their ideas on club work, and takes them from the local to the provincial viewpoint.

But the club means more to the members than a mere organization for the carrying on of projects. It looks after their social welfare, for the club does not aim at all work and no play. Organized play has been taken up, for boys and girls demand play, not merely because it is a way of working off surplus energy, but because it is one of nature's ways of teaching her young. The Boys' and Girls' Club teaches farming and housekeeping by the play method. They go one step further and have a play day or picnic. Frequently part of the Club Fair day is set apart for games. This brings the boys and girls, men and women, together for a social time. By having them play together the club is helping to teach its members the business of life, and is creating a better and finer community spirit.

The Boys' and Girls' Club is of vital importance, especially in rural districts and small towns. Life here is apt to be humdrum if the boys and girls fail to appreciate the things around them. Few of the lessons at school are related to their life on the farm. The fact that a broker in Montreal received 2 per cent. commission on some stocks he sold means nothing to them. Because school is uninteresting many boys and girls about twelve years of age are longing to break away from that which seems to bear no relation to their life. Club work has helped to relate the school to the child's environment. The problem it brings to him may be dealing with the 7 per cent. butter fat his cow gives and whether it is profitable to keep her.

Academic work has been benefited because of the added interest the children have in problems which relate to the life in which they live. The Club, working through the school, can and does interest the boys and girls in the home and the home farm. Moreover, by establishing an organization for co-operation the boys and girls are learning the community idea. They are learning to think together, work together, and play together.

Buy New Plant

Dominion Loose Leaf Company, Limited, Are Increasing the Size of Their Ottawa Plant

The Dominion Loose Leaf Company, Limited, printers, bookbinders, and manufacturers of loose leaf systems and devices at Ottawa, Ont., have recently bought a plant and some property from the Library-Bureau Company. The land purchased is situated very centrally in Ottawa, being about five minutes' street-car ride from the City Hall, and only half a block from the "Driveway." It has a total area of about two acres.

On this site the company are erecting a large one-storey daylight plant which will give a factory floor space of about 45,000 square feet. The entire plant and stock rooms will be on one floor. The expansion has been found necessary, as for some time the company have been crowded for space in their present quarters. The new plant will furnish facilities for an increased output.

Canadian Patent for License

Benham & Sons, Limited, of London, England, are desirous of licensing a Canadian firm to manufacture their steam radiator as covered by Canadian Patent No. 194,459.

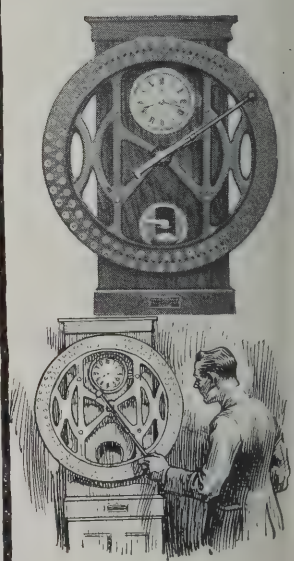
CANADIAN And Proud of it

Working Time is Always Precious

Every minute of working time you buy should be recorded. The time record should be made by the employee himself—so he will be satisfied with it. At the same time it should be infallibly accurate and unchangeable. Working time is your biggest raw material purchase.

International Time and Job Recorders



We make time recording systems to suit any kind of business. Salary time, piece work time, process time—any kind of working time you buy can be measured on our machines. We specialize on electrical installations, whereby all clocks, recorders, program devices, time stamps, etc., are controlled and synchronized by a Master Clock.

Branches in all Principal Cities

(Also makers of Hollerith Electric Tabulators and Dayton Computing Scales.)

"Here is the Rudder of Our Business"

It's the first means we ever discovered that gave us our productive labor and expense labor costs clearly and definitely. Knowing those costs has revolutionized our whole cost-keeping system and has called for some very welcome changes in our selling prices."

International Job Time Recorders

are doing this vital service in thousands of plants whether for piece work by individual workmen or groups, whether for individual jobs or processes in several manufacturing operations. Thus Job Time Recorders are invaluable. They give the job or process starting time and the finishing time in plain, printed, unchangeable figures. They replace variable lead pencil records. They facilitate the foreman's duties. They tell you who is doing the work and how much. They weed out inefficiency.

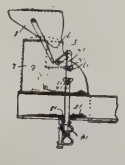
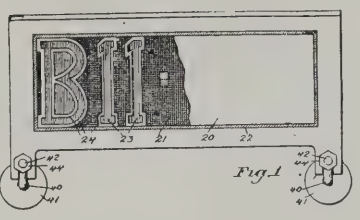
PATENTS FOR SALE

WAGON provided with a chassis, a plurality of radially disposed springs, a means for centrally swivelling the front wheel axle upon a plate whereby the wagon can be easily operated when turning. Full particulars and descriptive matter will be sent upon request. Wm. S. Smith Austin, 53 Hudson St., Johnson City, N.Y., U.S.A.

TIRE TREAD having a series of endless flat wire cables arranged at the tread and covering the tread. This should be a most efficient tread, and owing to its lasting qualities, it should become a good seller on the market. Can. and U.S. patents are for sale. Full particulars can be obtained from the patentee, James W. Taylor, Dudley, Idaho, U.S.A.

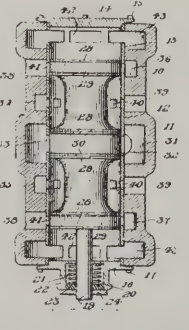


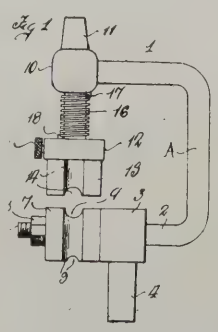


LITTER CARRIER consisting of a pole track adapted to swing to any desired angle and a track connection between the stationary track and the pole track, adapted to bend so as to form a continuous track connection. Full particulars can be had from the patentee, William S. Beaty, Milton, Ont., Canada.

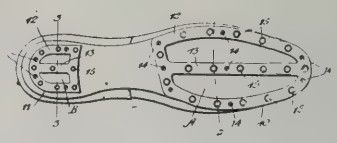
HANDLE FOR SHOVELS AND THE LIKE. This invention relates to attachments for shovel handles where the hand grips the handle and acts as a protection to the hand when digging trenches, post holes or other narrow excavations. Can. and U.S. patents for sale. William Cooper, 120 S. Clinton St., Syracuse, N.Y., U.S.A.

CAR STEP, whereby the lower step of a street or railway car will be folded or unfolded by the conductor when leaving or stopping at the station. Full particulars can be had from the patentee, Henry B. Stratton, 500 Grover St., Warrensburg, Mo., U.S.A.



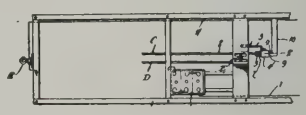


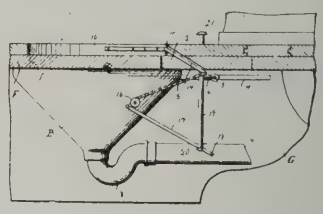
SIGN consisting of a frame in which a translucent plate on which characters are displayed, is mounted, a light carried in said frame for illuminating said translucent plate whereby said characters become visible. Full particulars can be had from the patentees, Messrs. Geo. W. Balogh and Ladislaw Puski, 561 South St., Detroit, Mich., U.S.A.



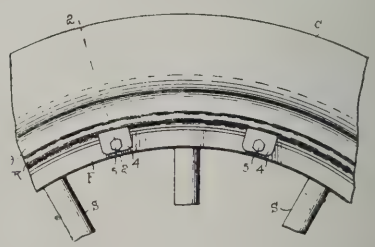
SWITCH SIGNAL adapted to be mounted on switches, which is useful in day time as well as at night for clearly indicating at a distance whenever the switch has been left part way open instead of being entirely closed. For full particulars, write John Craigmyle, Danville, Ill., U.S.A.

VALVE FOR ENGINES, whereby more efficient power production is obtained. It can be manufactured cheaply and is most durable. Canadian and U.S. patents for sale. Full particulars can be obtained from Giovanni Antonelli, Sparks, Nevada, U.S.A.





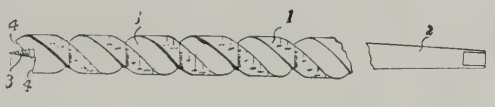
SWAGE ATTACHMENT FOR ANVILS wherein a blacksmith can use the swage without the need of a helper. Can be attached to any ordinary anvil and quickly adjusted for use with different sizes of work. U.S. and Canadian patents for sale by Abraham L. Amos, 405½ W. South St., South Bend, Ind., U.S.A.

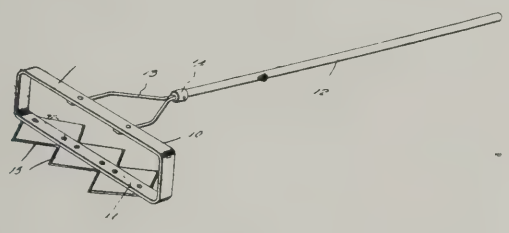


CAULKED SHOE PLATE for lumbermen's boots, formed of relatively thin flexible and elastic material. The material is provided with a series of spaced outwardly projecting caulks and a means for suitably connecting the plate to the shoe. Full particulars and sample can be had from the patentee, Stephen A. Moore, Powers, Oreg., U.S.A.

AUTOMOBILE TAIL LIGHT, which has many good features, and is adapted to operate with the longitudinal movement of the shift rod of an automobile mechanism so that the lights will be turned in the direction that the automobile is turning to. Canadian patent for sale. Full particulars can be had from James A. Ross, 515 Barrington Street, Halifax, N.S., Canada.

CUSPIDOR. This invention is one which can be used in hotels, public places or private homes. Can be made in different sizes and connected up with the waste pipe, so that it can be properly flushed out. Full particulars can be obtained from Mr. Wm. Dunnell, 289 Hartford Ave., Detroit, Mich., U.S.A., whose Can. patent is for sale.

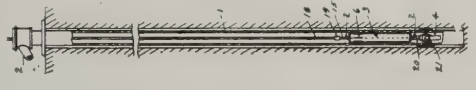




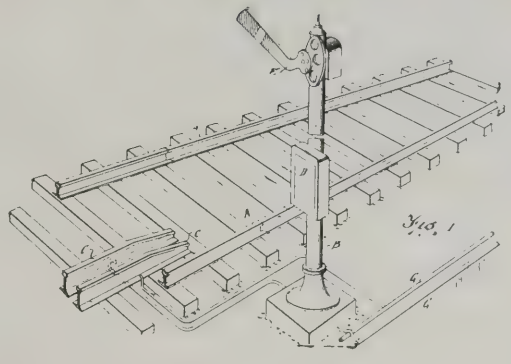
TIRE, provided with improved clincher channels and a new construction in the general make-up of the tire, and tubes seated within the tire and chamber afforded by the opposite faces of the rim and holder member. Full particulars can be had from the patentee, J. H. DeLong, 553 Sixth Ave., North Troy, N.Y., U.S.A., whose Canadian patent is for sale.

HAROLD C. SHIPMAN & CO., Patent Attorneys, Ottawa, Canada

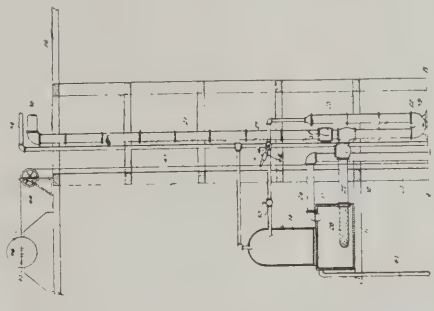
PATENTS FOR SALE



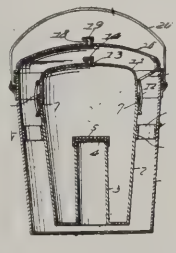
BIT, on which figures are imprinted showing the distance from the point of the bit, so that a carpenter can tell the distance the bit has travelled into the wood or other material. Canadian patent for sale by Mr. Ernest R. Mosher, Bayside, N.S., Canada.

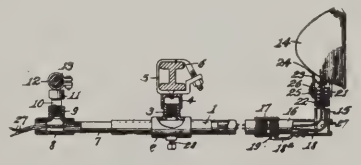


AGRICULTURAL IMPLEMENT. This device is one of simple construction, easy to manufacture, and can be sold at a good profit. Canadian and U.S. patents are for sale. Full particulars can be obtained from Mr. S. B. Svendsen, Espanola, Florida, U.S.A.



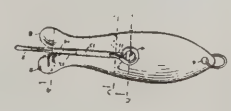
AIR-LIFT PUMP, which can be operated on either water or oil wells. The pump has been used successfully in Southern California oil wells, and full particulars can be had from the Tucker Pump & Engineering Co., 108 W. Washington St., Los Angeles, Cal., U.S.A.



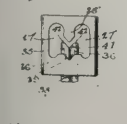


BRAKE FOR TRAINS, consisting of a pair of auxiliary rails located adjacent to the track rails so that when the train goes over the same, an electric circuit is closed for automatically operating the air brake mechanism on the train. Canadian patent for sale. Full particulars can be obtained from V. S. Burton, Box 6, Courtright, Ont., Canada.

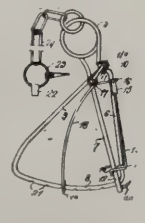
PUMP. Patent on a pump for pumping water with foreign substances therein, such as water from coal, iron mines, etc. Manufacturers of pumps should obtain full particulars of this invention as it has considerable merit. Herman A. Herpst, Box 638, Norway, Mich., U.S.A.



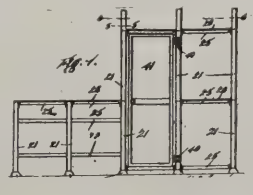
CULINARY UTENSIL, consisting of a pair of boilers, one disposed within the other, for boiling puddings or the like. It also has the alternative function of an ice cream freezer. For full particulars, write Sarah K. Allison, 504 E. Washington St., Macomb, Ill., U.S.A.



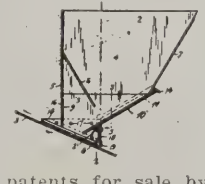
DIRIGIBLE HEADLIGHT. Many constructions have been worked out, but owing to the simplicity and efficiency of this construction it should prove to be a commercial success when properly placed onto the market. Full particulars can be had from the patentee, Thomas Padgett, care The Wooden Ventilator Co., East Palestine, Ohio, U.S.A., whose Canadian and U.S. patents are for sale.



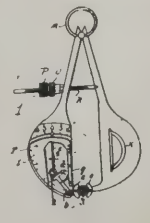
ARTIFICIAL FISH BAIT, consisting of a spoon in which an ordinary hook is threaded through a set of openings situated longitudinally of the spoon. Any ordinary hook can be used so that if a hook breaks, the ordinary hook which the user has can be readily adjusted into position without losing the entire spinner. Samples and full particulars can be had from Frederick Dubrow, care his attorneys, Harold C. Shipman & Co., Ottawa, Canada.



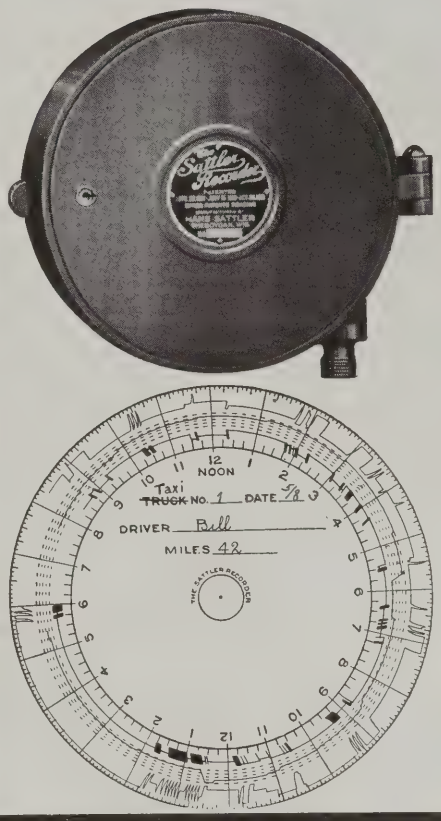
GUN SIGHT, having a V-shaped notch in the front sight and an opening in the rear sight through which the front sight is visible, a depending pointer co-operating with said notch to determine the sighting elevation without excluding the object from view. Patents for sale by Herman R. Frensdorf, Tipler, Wisconsin, U.S.A.



ANIMAL TRAP, consisting of a looped member in which the animal is gripped by a spring-tensioned member upon attempting to pass through the loop. Can. and U.S. patents for sale by the inventor, Thomas J. Ellison, 220 N. Third Street, Richmond, Ky., U.S.A.



COMBINATION KNOCK-DOWN STRUCTURE, providing a plurality of frame members, including uprights adapted to be assembled to form various structures, such as lockers, closets and booths, or as desk and lockers in combination. Can. and U.S. patents for sale by Wm. Kopp, 8504 Lefferts Ave., Richmond Hill, N.Y., U.S.A.



HOPPER BOTTOM, providing an improved means for discharging from a hopper onto a belt so as to avoid wear on the belt of the material, most of which would be in pulverulent condition. Can. and U.S. patents for sale by Frederick E. Carr, Box 22, Hercules, Cal., U.S.A.

INDICATING CALIPERS, equipped with a pair of sensitive contact pieces responsive to the least variations, which variations will be registered on a dial through the instrumentality of an amplifier. Can. and U.S. patents for sale by Harry B. Douglass, 127 Harmon Ave., Detroit, Mich., U.S.A.

HAROLD C. SHIPMAN & CO., Patent Attorneys, Ottawa, Canada

CANADIAN PATENTS FOR SALE

The Sattler Recorder

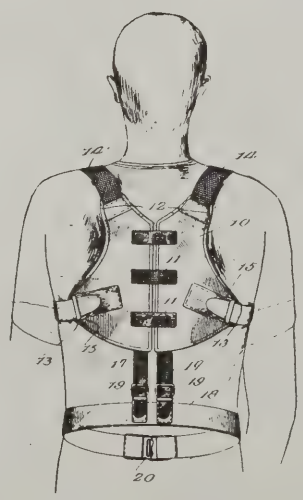
Are Your Repair and Tire Bills Too High?

They will not be if your truck is driven as it should be. With a Sattler Recorder on your truck this can be done. It tells you just how your truck is driven.

It gives a complete graphic record of the movements of a truck or automobile for 24 hours.

TIME: The duration of every movement and every stop, no matter how long or short, and the time they occurred.

SPEED: The speed at which **any mile or part of a mile** was made and **miles per hour.**

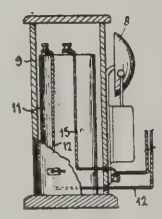


TOTAL MILEAGE: Computed every 20 miles.

And an extra time record having no connection whatever with the running part of the truck, **to guard against tampering,** making the record of the Sattler Recorder **positively reliable.** This record also shows whether the truck stopped on the right or wrong side of the street.

All the above records are on one chart, you file this chart and you have everything, a complete record.

Write for Descriptive Circular



HANS SATTLER Sheboygan, Wis.

SHOULDER AND BODY BRACE, with yieldable connection between them and an abdominal belt so arranged and fitted as to be most adaptable for the purpose for which it is designed. Considerable money can be made out of this if properly handled. For full particulars re Can. patent, write to Willoughby D. Hardy, 610 W. 115th St., New York City, N.Y., U.S.A.

PATENTS
Trade Marks, Design Patents, Copyrights

Being near the Canadian Patent Office we are able to personally interview examiners, thus often getting broader claims and earlier allowance of your Patent. We have access to all Patent Office Records for making searches and report, and solicit the business of Manufacturers, Engineers and others who realize the advisability of having their Patent Business given PERSONAL ATTENTION by Experts at Ottawa.

RAIN ALARM, for sounding an alarm at the beginning of a rain storm, thus warning the occupants of its beginning, so that the windows and doors may be closed to prevent damage by rain. Full particulars can be had from the patentee, Arnold T. Soderquist, R. 1, Box 49, Dalbo, Minn., U.S.A., whose Canadian and U.S. patents are for sale.

VIOLIN PEG, which is designed to overcome the undesirable feature of the tension tightened peg. This peg will not break the side walls of the violin neck, and is adapted to engage a string securely. Full particulars can be had from the patentee, Mr. Peter D. Brown, 12 Markland Street, Kingston, Ontario, Canada, whose Can. and U.S. patents are for sale.

NEWS AND VIEWS OF THE ASSOCIATION

Continued from Page 68

pwards of $50,000,000. The excavation section of the canal s 8½ miles long; the width of the rock section is 48' and hat of the earth section 162'. The enterprise involves the xcavation of 4,000,000 cubic yards rock and 11,000,000 cubic ards earth. A great deal of work yet remains to be done ut the commission are advised by their Consulting Engineers hat at the present rate of progress, the Chippawa-Queenston levelopment will be ready and delivering power by October, 921.

Visit of the Cleveland Chamber of Commerce

On the 11th of August, Toronto was favored by a visit rom a delegation of the younger Executives of industrial rms, members of the Manufacturers' and Wholesale Mer-hants' Board of the Cleveland Chamber of Commerce, con-isting of representatives of three groups—the Employment Managers' Group, the Production Managers' Group and the ccounting Managers' Group. These groups are organized or educational purposes, meeting periodically during the all, winter and spring, and during the summer months, ccasionally visiting industrial plants in a body. The To-onto Branch Executive made suitable arrangements to enable he visitors to visit some of the larger Toronto factories, hen an opportunity was afforded to the production mem-ers of the delegation to see something of production meth-ds in Toronto—the Employment Managers having the op-ortunity to discuss employment matters with the Employ-ent Departments of these plants, and the Accounting anagers had the opportunity of discussing accounting roblems with the Accounting Departments in the various cal plants.

Before the delegates left the city, they explained their arm appreciation to H. Macdonald, the Secretary of Toronto anch, for the facilities placed at their disposal and sug-sted that they in Cleveland would sincerely welcome a like sit from representatives of the Toronto factories, believing at it would be well worth while from an educational stand-int.

Quebec Division and Montreal Branch

By R. W. GOULD

Secretary, Quebec Division, C.M.A.

August, a month usually bearing the symptoms of lethargy i Association circles, owing to the absence of members on liday trips, has been unusually busy this year. Several tters cropped up which were unforeseen, and accordingly ne of the members had to change their plans and attend to them.

The matter which has been the cause of most activity whin the circle of the Montreal Branch the application of the Bell Telephone Company to the Board of Railway Com-missioners for authority to increase their tariffs. The fly in the ointment is that part of the application asking for permission to inaugurate a measured service system in the city of Montreal.

The Montreal Branch and the Quebec Division took the matter up immediately the application was made known. The Montreal Branch was represented in the matter at a civic meeting some days ago, after which the Administrative Com-mission asked that the branch name a representative on a special committee to co-operate with the Commission in pre-paring a case in rebuttal of the company's request. F. W. Stewart, chairman of the Montreal Branch, was named as the branch representative on this committee wih H. P. Diplock of the Steel Company of Canada and Michael Hirsch of J. Hirsch & Sons, as alternatives. The new committee has not yet held its first meeting. The Branch has sent a question-naire to each of its members asking that they take a census of their telephone traffic over a period of a week and return the result to the Montreal office so that definite evidence may be secured in the matter to present to the proper authorities when the time comes. The Quebec Division has also taken the matter up and a meeting of the Quebec Branch will be held on September 3rd when the question will be discussed for that city.

In reply to a circular sent out by the Quebec Division, ask-ing its members if any of them desired to submit evidence before the sittings of the International Waterways Commis-sion to be held in Montreal sometime before October 15th, not a few of the members have replied stating that they are in-terested generally in the project and a few are preparing evi-dence for submission.

The Quebec Division suffered a severe loss in the person-nel of its membership on Saturday, August 21st, when Eugene Julien, founder and president of Eng. Julien et Cie of the City of Quebec, died after a brief illness. Mr. Julien was a member of the Divisional Executive and one of our most active mem-bers in the city of Quebec. He had been a member of the as-sociation only one year but in that time had been most active in association work, particularly in connection with the new Budget Taxes introduced last spring. The Quebec Branch and the Provincial Division will feel his loss keenly and the business interests of the City of Quebec will have an empty niche difficult to fill as the late Mr. Julien filled it.

The entire membership of the Division is looking forward with a great deal of anticipation to a visit in October from prominent members of the association in Ontario. It had been hoped that these distinguished visitors could come to Quebec in September, when nature offers so much in this province, but other engagements prevented this wish being realized. They will be extended all the hospitalities and courtesies for which this province is famed. It is proposed to hold meetings in Quebec, Sherbrooke, Three Rivers and Montreal during this entente cordiale tour.

There has been a rush of foreign buyers to Montreal during the past month. Men from all quarters of the globe looking for all manner of manufactured goods have visited the Asso-ciation Offices, and efforts have been made to assist them in securing the material they desire. All bear the slogan on their tongues, "We want Canadian goods if they are to be had."

A meeting of the Montreal Branch was held on August 10, and among other matters taken up was that of co-operating with the Chambre de Commerce in this city in a project for the publication of an Industrial and Financial Year Book for the City of Montreal.

An Industrial Development Committee of the Branch has been formed with Lt.-Col. W. J. Sadler as chairman. Colonel Sadler was chairman of the Montreal Branch last year and the organization of such a committee has long been one of his hobbies. Under his direction great expansion is expected.

The Graphic Arts Section has been unusually busy during the past month preparing for a survey of the printing indus-try in Montreal which will be started on October 5.

Lightning Rods

New Parliament Buildings at Ottawa are Being Equipped with the Shinn Flat System

Visitors at the Parliament Buildings during the past few days, says the Ottawa Farm Journal of August 24th, having had their curiosity aroused by the presence of steeplejacks on the top of the highest tower of the new Centre Block, will be interested to learn that this magnificent structure is being protected against lightning, thus setting Government approval on the lightning rod, an appliance whose high efficiency it took many years to establish from the practical side.

Special care is being taken that the installation be in keeping with the architectural features of the building. The work has been entrusted to the Shinn Manufacturing Company of Canada, of Guelph, Ontario, and is in personal charge of Professor W. H. Day, who for many years as Professor of Physics at the Ontario Agricultural College, carried on ex tensive research as to the efficiency of lightning rods, whic resulted in establishing the fact that good lightning rod installed in accordance with the laws of science are almos absolute protection against lightning. Shinn flat cable an Shinn equipment is being used throughout, and it is estimate that several thousand feet will be required to give a complet system for the many intricate features of the building, whic in addition to being over 600 feet in length and 245 feet i width has some 20 odd chimneys and nearly a dozen tower of varying heights, the highest now completed rising 140 fee The main tower, the footings of which have just been laid will be from 300 to 350 feet in height when completed.

The skill and daring of the steeple-jacks commanded th admiration of those who chanced to witness their work, an their feats furnished thrills quite equal to those produce by the daredevil acts of the moving picture film.

The protecting of the new Parliament Buildings marks forward step in the art of protection against lightning i Canada. It has been the impression with many that whil protection was essential in the rural districts, where fire-fight ing appliances are lacking, it was not necessary in urban centres. The heavy lightning losses on prominent building in cities during recent years, as evidenced by insurance com panies, have emphasized the fact that if such structures were protected against lightning, vast sums of money would b saved annually thereby, and the resources and wealth of th nation correspondingly increased.

The Canadian Pacific Ocean Services have let contract t the Wallace Shipyards for a new passenger steamer for th coast service. The vessel, which will cost $1,500,000, will b 325 feet long with a speed of 17 knots and will be speciall for the Alaska run.

Make That Dream Come True!

Most every manufacturer dreams of the day when his plant will have its own chemists and laboratories.

Then he can make invaluable checking tests and analyses, pursue constructive technical investigations, speed production and cut costs by scientific factory control.

Make the dream a profitable fact.

Have us detail one of our trained technical men to make a survey of your plant. He will do all that your own chemist or engineer could do—and more, for he brings to bear on ***your*** problem the concentrated experience of thirty years' work of Canada's foremost commercial laboratories.

OFFICE AND FINANCE

The Central Stenographic Bureau

A Labor Saving Device in Office Organization—Reducing Overhead Expense by Centralizing Stenographic Work

By ALAN M. IRWIN

LABOUR saving devices in the office do not confine themselves to mechanical arrangements. We feel that economies may be effected in a variety of ways. The Duplicator now takes the place of the ancient letter press and tissue leaved book. Telephones have superseded the mails in the transmission of what once constituted our least important correspondence. Handwriting in business is now confined to signatures on letters and cheques and the typewriter records our messages on paper.

All of these things must have seemed upheavals when they were introduced. Conservative business men shook their heads and prophesied endless troubles and expense in maintaining mechanical aid to efficiency. Business men who are far from conservative will even now fight tooth and nail against some innovations, especially if these, generally at the instigation of an efficiency engineer, touch too closely upon their own particular office or department.

Executives are prone to think that a personal stenographer is indispensable; they have always had one, why should they not continue? "She knows my work" is a common cry. Granted, but this is unjust: unjust to themselves and unjust to the stenographer. It is unjust to the executive in that it means inconvenience to him when Miss Jones is sick or on a vacation and a supply has to attempt to carry on. The stenographer, on the other hand, when tied to one executive and to his particular share of the business gets into a rut. To be sure it is a nice, soft, comfortable one. Its chief beauties consist of ample leisure when Mr. Brown is in conference or out of town, and quite often in addition, a nice little home to herself in which to work.

The Twentieth Century girl no longer considers business only as a stepping stone, she wants to be able to work, and to be promoted. She wants the same chance of advancement as her brother, and, given an opportunity to master the details of a business, she will prove of equal value.

The worries of Mr. Brown when Miss Jones is on vacation and the ambitions of Miss Jones seem rather far from our title. Let us link them up.

The Production Engineer understands the value of standardization. It saves him time and it saves the factory money. He standardizes certain parts and he centralizes the machines which make those parts.

The Office Manager as Production Engineer

By centralizing his force of stenographers, the Office Manager can standardize the firm's letters. By standardizing the letters he can save money, increase efficiency and build goodwill.

It is a known fact that the actual taking of notes and transcription thereof takes up only about fifty per cent of the stenographer's time. The balance is wasted in interruptions in dictation caused by the receipt of calls, personal or telephone, by the dictator; inter-leafing letter heads, carbons and copy sheets and getting supplies. In a central bureau these details may be attended to in bulk.

No office needs as many stenographers as there are correspondents. An intelligent arrangement will result in the elimination of an average of fifty per cent. Firms using the dictaphone have already experienced this. Dictating machines are costly and the good results obtained from their use may be enjoyed wthout the heavy initial cost.

Organization of a Central Bureau.

Requirements. A room large enough to contain the requisite number of machines. This room should be far enough away from private offices to deaden the sound of the machines. The machines should of course be equipped with sound deadening devices for the benefit of their users.

Supervisor. A good supervisor should be appointed, one of course possessing the necessary qualities of firmness, tact and organizing ability.

Stores. A store cupboard with sufficient shelving for a weekly supply of material.

Office Boy. The boy detailed to the Steno Division will attend to all necessary details of the work. His chief duties will be the assembling of supplies and their upkeep in the various desks. He will prepare letter head, carbons, etc., and place these in racks so that the stenographers may give all their time to transcription. Changing ribbons will be part of his duties, included in which is the care of the heavier cleaning.

Signal System. A system of signals from executive's desks to the annunciator at the supervisor's desk is essential unless it is desired to use the existing telephone facilities. Definite rules must be formulated and observed not only by the bureau, but also by correspondents. Stated periods for dictation readily become a habit. Interruption may be reduced by placing a schedule with the switchboard operator, who may, in the case of calls not vitally important, postpone these calls until after Mr. Brown's dictation period.

When the executive is ready to dictate, at ten, eleven or what hour is decided upon, he will press his button. The Supervisor of stenographers will detail a girl to take this dictation and will time her out on the roster. Other calls will be handled in rotation. The rotation should not be a definite standard as it may be found that the first hour of the morning will often be taken up with the transcription of less important letters crowded over from the previous day.

The messenger will make collections at stated intervals, taking completed letter to his desk where he will extract the carbon sheets. He will then deliver the correspondence to the supervisor who will check it over, credit the stenographers with their quotas, and mark up work for merit or demerit marks where such system is in vogue. Correspondence will then be delivered to executive for signature at hourly intervals in order that a steady flow through the

PELEG HOWLAND, President

The Bank offers a service of the highest order to Canadian manufacturers because of its 180 Branches located in important industrial and agricultural centres throughout Canada.

COLLECTIONS made at all points in Canada and in foreign centres.

DRAFTS—Money Orders and Letters of Credit issued, available throughout the world.

EXCHANGE—Domestic and Foreign Exchange bought and sold.

SAVINGS received at all Branches—interest credited half yearly at current rate.

Accounts of Merchants and Manufacturers solicited.

HEAD OFFICE - TORONTO

mailing department to have its work finished when the office closes, thus eliminating the overtime which is common to this branch.

The supervisor should keep records of the quantity and quality of work turned out by individual stenographers; their attendance, punctuality and in fact anything that demonstrates their value.

Promotions and salary increases may be awarded on a scientific basis as a result of these statistics and the general standard of letter-writing raised.

Executives will be served always by someone having a general knowledge of their work, as every girl has had an opportunity of learning it.

Stenographers benefit by their increased knowledge of the different branches and departments and the firm saves valuable time and money.

There are of course exceptions. The President and the General Manager of large concerns often require the services of a private secretary, who, in addition to her stenographic duties, attends to the answering of the telephone, making of appointments and the confidential files. These things of course remain unaltered.

That the installation of the Central Bureau saves an average of fifty per cent. at least is generally conceded. In fact in one office the result was as follows:—

"There were nineteen private offices and each of these offices had its private ante-room for stenographer. The partitions were taken down with the result that a large general office was made. Lights were reduced from sixty-eight to twelve. Stenographers were reduced from nineteen to three."*

The above stands out as a particular and it may be an isolated instance, it nevertheless proves that the re-arrangement outlined may be of immense saving. And any saving in time, effort or money in these days of maximum production and minimum profits may be counted as money earned.

There are, naturally, some instances where it is cheaper to continue the usual system of one executive—one stenographer. In this, as in any matter calling for re-organization, it is advisable to go slowly and consider the question from all angles.

Time and motion studies are very necessary, and although these have been carried preceding the successful installation of this system where it is already in operation, it is advisable that they be carried out extensively before inauguration of the Bureau.

The office that saves money on its operations has graduated from the "overhead" to the producing class. Just as the appearance of your salesman, the dignity of your office, the courtesy of your juniors, are goodwill builders; so are uniform, neat and accurately typed letters. If your stenographer are on their mettle to produce good letters, then your letters are going to produce good results.

Change in Organization

Canadian Fairbanks-Morse Company, Limited, Increase Their Capital Stock

Some changes have been made in the organization of the Canadian Fairbanks-Morse Co. by sub-dividing the sixteen thousand shares of the capital stock of the company, now of the par value of one hundred dollars each, into eighty thousand common shares of no nominal or par value, and also increasing the capital stock of the company by the addition of forty-five thousand common shares of no nominal or par value, making the capital stock of the company one

* "Office Management"; The Alexander Hamilton Institute

hundred and twenty-five thousand shares of no nominal or par value, provided, however, that the company shall carry on its business with a capital stock of two millions, one hundred and twenty-five thousand dollars ($2,125,000).

Three-Million Dollar Increase

Report of the Canadian Pulp and Paper Association on Exports from Canada

Pulp and paper exports from Canada for April, the first month of Canada's fiscal year, reached a total value of $8,172,356, as compared with $4,968,939 for April, 1919, an increase of $3,203,417. They were made up as follows:

Month of April	1919	1920	Gain
Paper & Mfgs. of	$3,630,238	$4,729,354	$1,099,116
Chemical pulp	1,120,990	2,936,633	1,815,643
Mechanical pulp	217,711	506,369	288,658
	$4,968,939	$8,172,356	$3,203,417

The greatest gain was in unbleached sulphite, of which 397,359 cwts., valued at $1,587,236 were exported in April this year as compared with 870,786 cwts., valued at $352,485, last year. Of bleached sulphite, 131,161 cwts. valued at $728,669 were exported this year, as compared with 80,259 cwts. valued at $363,732 last. Exports of sulphate (kraft) pulp for the month amounted to 163 533 cwts., valued at $620,728 this year, compared with 131,375 cwts., valued at $404,775, last. Exports of mechanically ground pulp for the month were 198,664 cwts., valued at $506,369, this year and 161,449 valued at $217,711 last.

Newsprint formed the principle item of the paper exports for the month. There was, however, a falling off in the quantity although an increase in value, there being 899,342 cwts., valued at $3,827,541, exported this year, compared with 920,592 cwts., valued at $3,160,318 last.

Exports of pulpwood for the month amounted to 40,433 cords valued at $420,741, a decrease from 68,680 cords, valued at $629,189, a year ago.

The distribution of the month's exports was as follows:

	United Kingdom	United States	Other Countries
Total paper	$344,517	$3,730,682	$654,155
Total pulp	514,568	2,506,825	421,509
Pulpwood		420,741	
Totals	$859,085	$6,658,248	$1,075,664

Making Friends By Telephone

(From "Ames Holden Shoe Facts for Canadian Shoe Retailers ")

Telephone customers are shown exceptional courtesy when dealing with a certain wholesale concern. The following telephone rules are adopted, and a list of them placed over the desk in the order department:—

(1) Answer telephones as soon as they ring, the customer can't see what's delaying you.

(2) Keep the customer's transmitter closed; outside conversation makes a customer feel neglected.

(3) Be patient—don't rush the telephone conversation; the customer may think you want to get rid of him.

(4) Personal and house calls must be dropped when a customer calls; we are in business to take orders.

(5) Don't forget the smile in your voice. The customer can't see you. Your voice forms his impression of the house.

(6) Try to remember voices; a customer feels complimented if called by name.

BANKING SERVICE

Your banking requirements may be entrusted to this Bank with every confidence that careful and efficient service will be rendered. Our facilities are entirely at your disposal.

AN ALLIANCE FOR LIFE

Many of the large Corporations and Business Houses who bank exclusively with this institution have done so since their beginning. Their banking connection is for life—yet the only bonds that bind them to this bank are the ties of service, progressiveness, promptness and sound advice.

391 Branches in Canada Extending from the Atlantic to the Pacific

No. 1—Sectional View of Bowser Filter Section Assembled.

No. 2—Filter Disc with Dirt Filtered from Oil.

It Gets the Dirt
It's a BOWSER Oil Filter

The pictures shown here illustrate the Bowser Filter Section as used in the Bowser Oil Filter.

No. 1 shows the Filter Section assembled, ready for use. No. 2 shows one of the Filter Discs with dirt that the Filter has collected from used oil. This pile of dirt is about 6″ in diameter and from 2″ to 3″ high.

There are twelve of these Filter Discs and Cloths in a Bowser Filter Section—each as effective as the one you see pictured. As many complete Filter Sections as needed are furnished in the Bowser System. You may judge for yourself as to the value of such equipment.

Bowser Systems are applicable to any size and type of power producing and transmitting machinery.

We will be glad to send literature and explain to you how the Bowser principle of Oil Filtration can be applied to your Boiler plant.

Accurate, intelligent attention — Cumulative experience of ninety years
Prompt careful deliveries — Fair prices — Satisfaction

On account of the service offered, we number among our friends most of the Governments, Federal and Provincial—Municipalities, Banks, Transportation Companies, Corporations, Professional Firms, Colleges, Schools, etc.

If you have not already done so—why not open a ledger account with us. You will be surprised at the change.

P.S.—Catalogues and advertising literature yours for the asking

(7) Repeat orders back if customer will let you; any mistakes made will be laid to the house.

(8) Ask pardon during delays when getting information; every minute seems a long time to the customer.

(9) Use "please," "sir," and so on, and thank the customer by name; every one is pleased with courtesy.

(10) If the order is rush, telephone the shipping department that it's coming; our success depends upon promptness.

Saving on Envelopes

(Factory for August 15th, 1920)

Here is a plan that saves an appreciable amount on inner plant correspondence. Most plants have a lot of this kind of correspondence when men in one department have to send written messages to men in other departments. This is particularly true of the employment department. There is often occasion to send to the employment department messages from foremen in the shops that need men. And the employment department has frequent cause to communicate with the foremen about the men whom they are hiring. Most of these letters are about matters that the men sending them don't care to have anyone else know about. This requires that they be put in sealed envelopes.

The American Rolling Mills Company has a plan whereby they save the cost of these interdepartment envelopes, and still have the privacy of a sealed letter. Pads of forms that are used for sealed messages are made with one end gummed. Then dotted lines show where the form is folded so that the gummed end can be stuck over the folded paper and thus the form is made into its own envelope.

These are especially handy when there are new men taken on and they are sent down to the foreman under whom they are to work. Gummed ends on blank pads take care of any communication that is not covered by a form. In this way time and money is saved in the office.

Industrial Development

Cities of Port Arthur and Fort William Undertake Development of Mutual Ground Between

A municipal industrial development scheme that is rather unique, in that two cities are a party to develop one area for industrial purposes, is that now nearing completion by the cities of Port Arthur and Fort William. For many years these hustling localities have been expanding in opposite directions leaving a very fine area of about five hundred acres undeveloped between the two cities.

Two rivers which require very little attention to fit them for terminals flow through the property. In addition there are 4,000 feet of lake frontage developed and protected by breakwater as part of the National Government's $20,000,000.00 expenditure in making a National harbor.

This privately owned area is within the boundary of Port Arthur and the general scheme provides for joint purchase by the two cities, both to share equally in the cost of development and in revenue. Development plans provide for a combination of navigation and railway terminals with industrial property, the whole area to be a neutral zone, belonging to neither city, and to be administered by a Harbour Commission, who will sublet the actual requirements of incoming industries on long leases on the basis of actual land values with periodical re-valuation. The part of the scheme that is so unique as to be almost without precedent is that these two cities, which heretofore have been building up other portions and extending costly utility services will unite to place industries in a location that will

permit labour to be drawn from both (fifteen minutes street car ride to any portion of either). This must serve to bring the cities closer together by centralizing their industrial development and civic growth, and by decreasing municipal expenditure.

Street car service and all utilities are right at the property, in addition to which there is being developed 72,000 horse power of electrical energy to be sold at cost. This is only a portion of 300,000 horse power available. Some portion that present demands have made necessary is to be delivered this year.

Ford Motion Pictures

Operators of the Ford Motor Company of Canada, Limited, Complete Educational Films

The Moving Picture Operators of the Ford Motor Company of Canada, Ltd., have returned from an extensive tour of the Dominion. The itinerary of the operators took them from coast to coast, and into parts of the country seldom trodden by the foot of man. Thousands of feet of interesting subjects, industrial, scenic, historical and scientific, have been secured which will keep the laboratory men busy for months developing and assembling. The educational value of the work done by the company through the medium of these films has received very favourable comment in the press of late, and it was recently decided, owing to the gratifying reception given to these productions, to double the yearly output. The company will, therefore, release 26 complete subjects a year.

The Fraser Companies, Limited, have recently taken over the plant formerly operated by the Dominion Pulp Company at Chatham, New Brunswick. They will continue to operate this mill as it was formerly run, employing about two hundred and fifty men in the production of unbleached sulphite fibre.

Steps are to be taken by the Provincial Government of British Columbia to secure specific information as to the number of settlers arriving in that province, where they are locating and what they are doing, so that an efficient system of service to the immigrant on the land may be rendered.

Work in erecting the Government seaplane base at Vancouver, B.C., is proceeding rapidly. Hangars have been erected and two seaplanes have arrived, while two more will reach here from England at the end of this month. Along with eight others shortly, they will be used for fire, forest and fishery patrols, as well as survey work.

The Canadian Robert Dollar Company announce the purchase of the 11,550 ton freighter "Parisian" at London. The vessel will operate on the Oriental run from Vancouver as the "Esther Dollar," and makes the sixth steamer sailing from there to the far East under the Dollar flag.

Proof of the development of the Alberta coal industry is provided by official figures recently published showing production during first six months. To the end of June the output was three million forty thousand tons compared with two million sixty-nine thousand tons for the corresponding period last year. Figures include bituminous and lignite product. Operators state more coal has been marketed than in any other corresponding period in the history of coal production in Alberta.

What Will Your Business Be To-morrow?

Convinced of Canada's industrial future you are planning a sound organization, effective records, modern production methods and a loyal and efficient personnel.

To-day Determines To-morrow

Are you letting the pressure of each day's problems and the lack of trained assistance postpone your realization from month to month and year to year.

Similar circumstances have led the heads of many enterprises to enlist our assistance

We have been able to contribute :

that exclusive attention so necessary to real progress,
that very valuable outside point of view, and

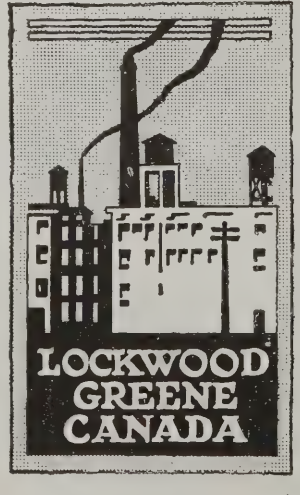
To-day Determines To-morrow

Export Trade from Viewpoint of the Canadian Manufacturer

(*Continued from page* 71).

selling in another, and perhaps in still a third it would be better to do business through a manufacturer's agent. The manufacturer must decide what method of selling he is to use in a particular market.

A decision on this question brings in its train many additional knotty problems. The manufacturer is at once involved in the difficulty of protecting certain markets for his own exclusive agents. It is a practice among some export commission houses to refuse to give information as to the name of the customer, and occasionally even as to the destination of the goods. A shipment ostensibly destined for India may be diverted by the export house to Argentina, where the manufacturer has an exclusive agency arrangement. Unwittingly the manufacturer may be cutting the market out from under his own representative or exclusive agent. The manufacturer should accordingly always require of his export representative information as to the destination of the goods. In short, in order to work out a successful combination of methods he must have a thorough understanding with each of his representatives and each of his customers exactly how business is to be transacted.



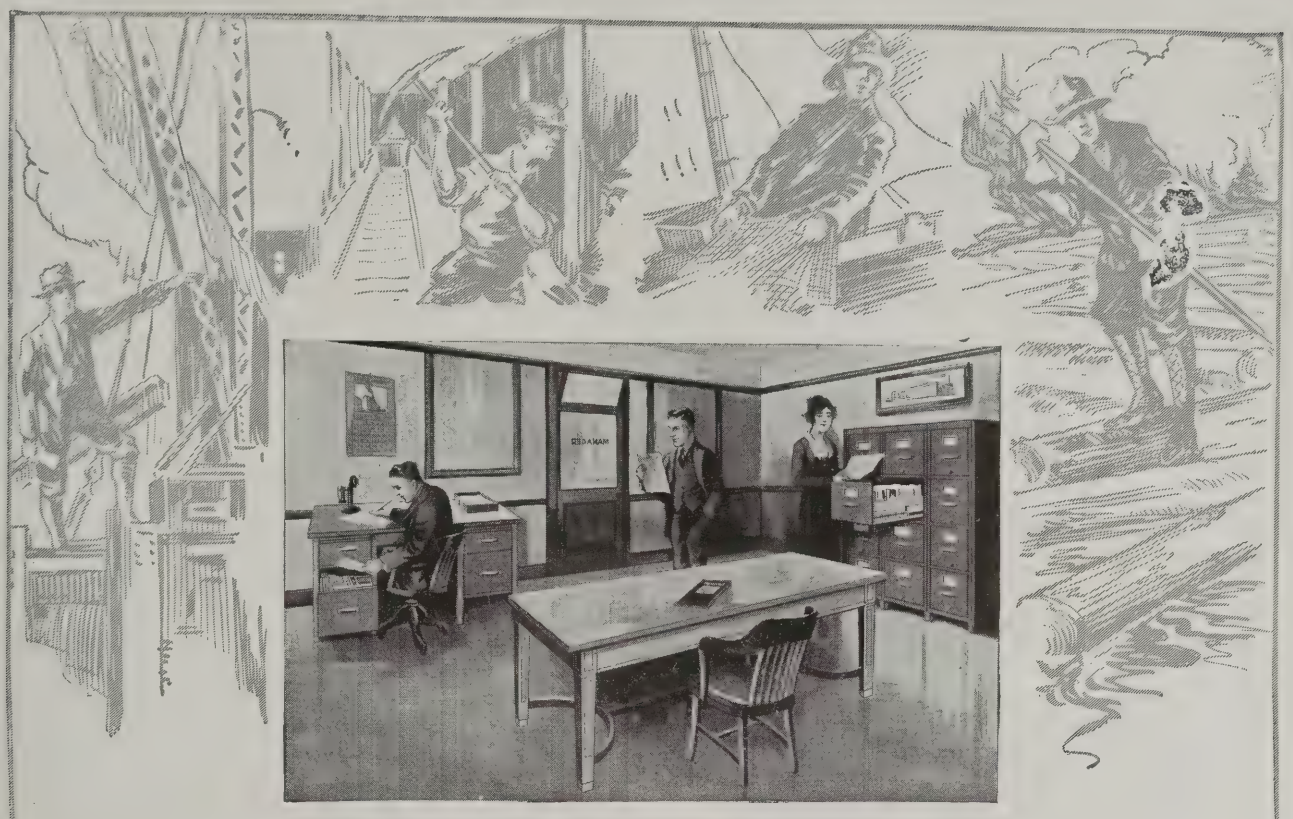
A knowledge of export advertising is also highly important. At the very outset of his export campaign the manufacturer should inform himself regarding the various publications and their value as mediums to assist him in securing agency connections with responsible foreign houses, in stimulating orders or developing inquiries by mail.

There are, first of all, the established export journals of Europe, particularly England, and those of the United States. Some of these cover the Latin-American field, while others cover the entire world through one or more editions published in various languages. It is an easy matter to investigate the services of the leading publications of this class and decide how far their co-operation will be of benefit in the campaign. Then there are the periodicals published in the foreign countries, and other forms of advertising media, much like those used in our own markets. The use of these requires rather expert knowledge as to local values, and should usually be left to the foreign branch manager or the foreign agent. It should rarely be left to the discretion of an advertising agency, unless the manufacturer is convinced that the agency has made a study of export problems and is as well informed regarding them as he would expect his own export manager or his manufacturer's agent to be.

Some form of advertising is as necessary to the successful conduct of export trade as it is in the domestic field. The commission houses and export merchants do not and *cannot initiate* orders for any particular manufacturer. Their business is primarly to sell to the foreign buyer whatever he wants. They are concerned with the articles, not the particular manufacturer who makes them.

There are other problems. There are the problems of keeping informed of the developments in the foreign markets, and of the goods manufactured by competitors. These and many other points must be decided before the manufacturer sends his first salesman into the field, or before he establishes a single exclusive agency, or before he advances any proposals to any professional export concern or organization of manufacturer's agents. But decide he must—willy nilly—or continue to pay an increasing rate of tribute to the initiative, energy and foresight of other nations.

Greater Production



From the Same Plant

Your present buildings can be arranged to take care of growing production needs until construction costs come down. Consult LOCKWOOD, GREENE—specialists in Expansion without Confusion.

At your invitation, we will study your problem with you—construction, extension, equipment, engineering, staff or labor. We prepare plans with the accumulated experience of many kindred operations.

Canada's Industrial Expansion

A Record of Progress

Operating New Furnace

Manitoba Rolling Mill Company, Limited, Make Steel at Selkirk by Open Hearth Process

On August 26th the Manitoba Rolling Mill Company, Limited, ran the first melt of steel from their new open hearth furnace, and rolled it into bars. George W. Allen, M.P. for South Winnipeg; Dr. Blake, M.P. for North Winnipeg; D. J. Dyson, Chairman of the Prairie Division of the C.M.A.; John Dafoe, managing editor of the Manitoba *Free Press*, and a large number of Winnipeg's business men travelled twenty-four miles from Winnipeg to Selkirk, where the plant is located, to attend the opening function. T. R. Deacon took the party through the plant, and explained the process to them.

The process heretofore followed by the company was as follows: Selected soft wrought iron and steel scrap, cut up into small pieces, were made into box piles about six inches square by three feet long, thin boards wound with wire being used to keep it in shape. These were then put in the furnaces and heated to incipient fusion (about 2,000° F.). When the iron became plastic and was about to run, it was rolled into muck bars, ½ in. x 6 ins. and about 20 feet long. These were then cut by shears into lengths of about three feet, and used as the sides of new box piles, which were again heated and rolled into finished rods and bars.

The open hearth furnace has just been completed. Scrap, steel and iron of all kinds with some pig and iron ore can be used in this for making steel of various grades. The steel is cast in ingots which are rolled into the finished product. A product greatly superior to that given by the first process thus obtained.

In most plants gas or oil have been used in operating open hearth furnaces. The Manitoba Rolling Mills Company are attempting to operate their furnace with pulverized coal which is blown into a reverberating furnace like the gas or oil. The furnace feeds so many minutes from one end, then so many from the other. The hot products of combustion pass out through piles of loosely built brick in the checker chambers beneath the charging floor. These catch and retain the heat, and when the feed is reversed, the air to feed the furnace, passing through these white hot bricks carries a part of the heat back to the furnace. A conservation of fuel is the result.

The Manitoba Rolling Mill Company are using coal from Western Canada in their plant. Previously they had used one hundred and fifty thousand dollars worth of United States coal, so a large importation will now be replaced by a Canadian product. It is hoped that when the new furnace is running to capacity the shortage of reinforcing steel and steel bars in the Prairie Provinces will be greatly relieved.

Watford Plant Enlarges

The Andrews Wire Works of Canada, Limited, Commence Large Addition to Their Plant

Work is being started immediately on a large addition to the plant of the Andrews Wire Works of Canada, Limited, at Watford, Ontario. The building will be of brick with steel sash and concrete floors. The roof will be supported by steel work and the construction modern throughout. The blower system of heating will be used. An increase of 75,000 square feet of floor space will be gained by the erection of this addition and a corresponding increase of output should follow its completion.

Building Commenced

Fort William Pulp and Paper Company, Limited, Start Work on First Unit

Work has been commenced on the first unit of the Fort Williams Pulp & Paper Company, Limited, and it is hoped to have the entire plant ready for operation by January 1st, 1922. The estimated output is at least one hundred tons daily,

Selkirk, Manitoba

Plant of the Manitoba Rolling Mills Company, Limited, where Steel is Being Made for Western Canada

and a minimum number of three hundred and fifty men will be employed. This number will be increased to one thousand during the cutting season.

The establishment of this plant should do much towards relieving the paper shortage. The thousand square miles of territory known as the Farlinger-MacDougall limits will supply enough raw material for forty-five years. They are held on a twenty year lease renewable for two further periods of twenty-five years each. Besides the general advantages gained by the city of Fort William in securing a three million dollar industry, extended street car lines and other improvements are being planned to meet the requirements of the company.

Hollow Ware Plant

The Gas City Brick Company, Limited, Increase Capacity by Installing New Plant

The Gas City Brick Co., Limited, of Medicine Hat, Alberta, who for several years past have been one of the largest manufacturers of common brick in the West, have recently augmented their facilities by the installation of a plant for the manufacture of hollow ware. This company is a limited liability concern capitalized at $300,000, $250,000 of which stock has been issued. The President of the company is A. G. Creelman, while its vice-president and general manager is L. Y. Birnie of Medicine Hat.

The present plant has a capacity of 200 tons daily, manufacturing upwards of 10,000 brick or 20,000 tile daily and employing some forty men. With vast clay deposits at their doors and the advantage of natural gas in unlimited quantities the development of these resources and the expansion into new fields is a logical outcome, hence the decision of the directors to extend their organization for the purpose of manufacturing tile.

Early this spring, new equipment was installed and numerous experiments were made in order to produce the Heath Unit Tile, of which they are now the sole manufacturers in this territory. The result of these experiments proved so satisfactory that they have now commenced to manufacture this tile in earnest and at this date have a large stock on hand of the various units.

This tile is proving a new departure in the hollow ware business, being made in brick dimensions, and in consequence eliminating difficulties experienced in the past in matching and finishing corners and jambs.

Adaptability to any size wall and added strength on account of the double web appears to be the keynote in the design of this tile and together with its cheapness, permanency and fireproof qualities, it will greatly assist in solving the problems of housing in all the western cities, where additional tonnage in this line is sorely needed.

Dental Supplies

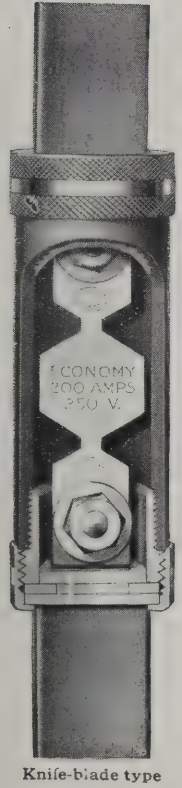
Coldwater, Ontario, Is the Place Selected for National Dental Company's New Plant

A new factory is being erected and will be opened early in October by the National Dental Company, Limited, at Coldwater, Ontario. The building is of cement and brick, 140 x 48 feet, and one storey high. The company will manufacture here their line of dental equipment, "National" brand, including chairs, electric engines, laboratory motors, etc. About twenty-five mechanics will be employed when operations commence in the new plant.

Cafeteria Equipment

CAFETERIA AT HARRIS ABATTOIR LIMITED, TORONTO

The economical operation of a Factory Cafeteria depends largely on the equipment. We have installed Cafeteria Counters with heating equipment, glass shelves, refrigerators, and supplied chairs and tables in some of the largest industrial plants in Canada.



We will design and submit plans and estimates for any size Cafeteria for your Factory upon your request.

Limited

UNITY BLDG. MONTREAL, CANADA

Economy Fuses were the first line using an inexpensive bare link for restoring a blown fuse to its original efficiency to be APPROVED IN ALL CAPACITIES by the Underwriters' Laboratories.

Make Advertising Calendars

The Gerlach-Barklow Company of Canada, Limited, Remove Plant to Stratford, Ontario

The Gerlach-Barklow Company of Canada, Limited, formerly located in the Darling Building, Toronto, have purchased a plant in Stratford, Ontario, where they are now manufacturing their regular line of advertising calendars, direct-by-mail advertising media, blotters, etc. The new building is 43 by 82 feet, consisting of three storeys and a basement. The approximate number of employes will be from forty-five to fifty.

The Gerlach-Burklow Company of Joliet, Illinois, are the parent company of this organization. The Canadian branch is capitalized at $40,000 and most of the stock is owned by officers of the United States company. E. A. Bush is the general manager.

Another Branch Industry

The Western Clock Company, Limited, Establish Alarm Clock Factory at Peterborough, Ontario

The Western Clock Company, Limited, who recently established themselves in Peterborough, Ontario, are a branch of the United States company of the same name at LaSalle, Illinois. The plant which the company have purchased at Peterborough is a building formerly owned by the Canadian Chicle Company and a great deal of attention is being paid to improvements calculated to make working conditions in the plant as pleasant as possible.

It is not the intention of the company to extend their present plant, but they expect to erect a new and modern plant in the future. Alarm clocks and clock watches will be the goods manufactured and machinery will be installed as rapidly as possible for this purpose. It is possible that the Canadian company may take over a large share of the export business now carried on from the parent factory at LaSalle. At the present time, however, operations are being started in a modest way, and the growth of the enterprise will be gradual.

This is the first alarm clock factory to be established in the British Empire. The Western Clock Company will specialize upon lever escapement goods and will not enter other fields, such as the manufacture of pendulum clocks and mantel clocks. Their operations will be confined to the production of nickel-plated alarm clocks and low-priced watches of the "Westclox" brand.

To Form Limited Company

V. P. Bernhardt Acquires Control of the Waterloo Glove Manufacturing Company at Waterloo, Ontario

V. P. Bernhardt, of Preston, Ontario, has assumed control of the Waterloo Glove Manufacturing Company at Waterloo, formerly owned by John Schondelmayer of that town. The business will be conducted under the same name and at its present location, but as the company have been expanding yearly since beginning as a fairly small concern, a reorganization has become imperative. Mr. Bernhardt is therefore engaged in working out details for making the firm a limited company.

Laurent, a suburb of Montreal, Quebec. The rapidly growing business of the Company has for some time taxed the capacity of the stove plant on King St., Toronto. It was impossible to enlarge this plant further as no vacant land was available, and these conditions made it necessary to consider another location.

The Canada Stove & Foundry Company have done a very large stove business in the Province of Quebec and this buiness will be added to the turn-over of the Gurney Foundry Company. The Montreal firm also has a modern, well equipped plant for producing white and colored vitreous enamel on iron and steel. The demand for the white enamel sanitary finish has been beyond question the greatest development in the art of producing stoves over the last decade, and the Gurney Foundry Company will now have unrivaled facilities for supplying this finish with Gurney-Oxford stoves. This enamel plant also does an important business in sanitary table tops, enamel signs, etc.

The head office of the company will remain at Toronto. The largest manufacturing plant of the company at West Toronto will be increased in scope and will produce the warm air furnaces heretofore manufactured in the King St. plant.

Purchase Pulp Mill

The Wolf River Pulp and Paper Company, Limited, to Operate at Riviere du Loup, Que.

The Wolf River Pulp and Paper Company, Limited, are a new corporation who have purchased the properties formerly owned by the Riviere du Loup Pulp Company. The capitalization of the company is as follows:—$500,000 common stock; $500,000 preferred stock; and $580,000 first mortgage, 7% bonds. The bonds were given in part payment for the property; the preferred stock has been underwritten and up to July 31st $153,000 of the same had been issued.

The capacity of the plant is at present about six thousand tons per annum, but the company expect to double this capacity by the installation of additional machinery and further development of water power. The plans for extension and improvement are still under consideration as the engineers have still to complete their study of the situation.

W. W. Moss of Baltimore, Maryland, is president of the Wolf River Company. The other officers are:—Porter H. Dale, vice-president; Ralph W. Moore, treasurer; A. A. Magee, secretary; U. M. Waite, general manager; and W. R. M. Moss, assistant treasurer.

Plant in Operation

Kennedy Car Liner & Bag Company, Limited, Making Bags, etc., at Woodstock, Ontario

The plant of the Kennedy Car Liner and Bag Company, Limited, at Woodstock, Ontario, is now in full operation, producing paper packing bags for all kinds of furniture, pianos, phonograph cabinets, stoves, etc. Covers of all kinds for broom manufacturers are also being made. In addition, the company manufacture the Kennedy system of car liners for preventing leakages of grain and seeds in transit; the Kennedy auto storage cover for protection of cars in storage during the winter; and the Kennedy moth-proof bag for guarding clothes against moths and dust damage.

The company are a Canadian branch of the firm of the same name located at Shelbyville, Indiana. The capitalization of the Canadian company is $100,000.

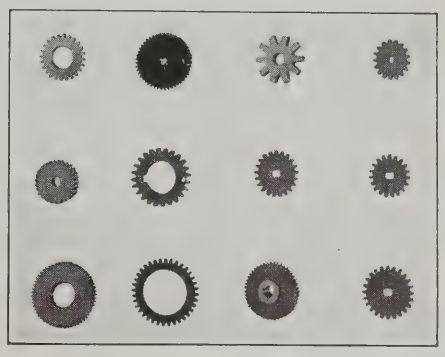
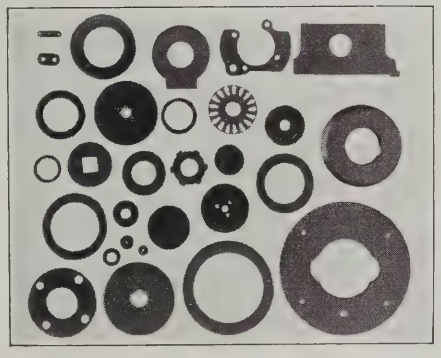
DIAMOND-FIBRE is the most adaptable material known. Its utility in the electrical, mechanical and industrial fields is practically unlimited. Its properties make it especially suitable as a raw material for products and special parts of every description.

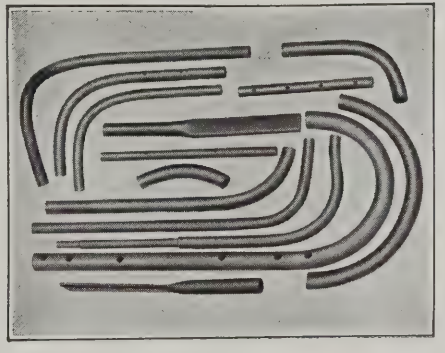
It is a superior material because of its great strength — compression, shearing, tensile and dielectric; its toughness and light weight; the ease with which it can be machined and formed; its attractive appearance; and its low cost.



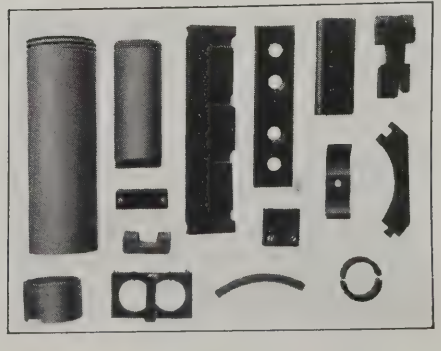
Diamond-Fibre combines in an unusual degree utility, machining and working facility and economy. Manufacturers everywhere find it a better and cheaper material. It replaces other materials with better results and less cost.



Diamond-Fibre improves the product and cuts production costs. It will pay you to investigate this material. Tell us your problem and let us co-operate. Send for booklet—"Diamond-Fibre and Its Uses."



Diamond State Fibre Company of Canada
Limited
TORONTO - CANADA



Diamond-Fibre is tougher than horn, almost as hard as iron, yet lighter than aluminum. Its compression strength is 30,000 to 40,000 lbs. per sq. in.; tensile strength 12,000 to 15,000 lbs. per sq. in.; shearing strength, 9,000 to 10,000 lbs. per sq. in.; and its dielectric strength, 200 to 400 volts per mill of thickness. It is impervious to oil, grease and ordinary organic solvents. It does not corrode, dent, break, split, splinter, or crystallize under severe vibration. It readily takes any machining process and can be formed into various shapes. Furnished in sheets, rods, tubes, and machined parts of every description.

Diamond-F

Erect Two New Buildings

Grinnell Company of Canada, Limited, Add New Foundry and Machine Shop

Grinnell Company of Canada, Ltd., is building a new foundry and machine shop in Toronto which taken in connection with its present equipment there, will represent an investment in this property of well over one million dollars. The new foundry is 100 x 210 feet, two stories high and of reinforced concrete construction, fully equipped with Automatic Sprinklers. The machine shop is 185 x 52 feet, basement and two storeys of reinforced concrete construction and fully equipped with Sprinklers. This new machine shop will be equipped with all the latest type of tapping and facing machines.

When completed, the foundry, as well as the machine shop, will be perhaps the most modern and best equipped structures of their kind in Canada, as plans for them were not drawn until a full investigation had been made of the latest foundry and machine shop practice both in the United States and Canada.

Grinnell Company will manufacture in this new foundry a full line of cast iron fittings,—screwed, flanged and underground. These fittings will be standard in every respect and will be exactly the same as the quality which this Company has always used in its construction work. Previously, these fittings were purchased from the States, but with this new foundry Grinnell Company of Canada will be able to take care of its customers with Canadian manufactured goods up to a capacity of twenty tons per day.

In putting this new money into plant additions in Canada, Grinnell Company gives tangible evidence of its belief in the industrial development of Canada and its purpose to grow with that industrial development. Not only will this new foundry with the existing machine shop allow the Company to give better service to its customers in the line of supplying fittings and other supplies, but it will greatly increase the service the Company is offering in sprinkler, heating, power and other industrial piping installations.

Electrical Goods

The Taylor-Campbell Electric Company of London, Ontario, Build a New Plant

A new factory, 35 x 160 feet, is being built on Adelaide Street, London, Ontario, for the Taylor-Campbell Electric Company. Here the company will carry on the manufacture of their line of electrical goods, which includes electric fixtures, reading lamps, toasters, irons, flashlights, toys, vacuum cleaners and washing machines. They expect to commence operations in their new plant about November 1st, with thirty-five employes.

Box Factory Extends

Additions and Improvements to the Factory of the Guelph Paper Box Company

Important additions to the plant of the Guelph Paper Box Company are nearing completion. The floor space is being increased about 50 per cent. and several new machines are to be installed. The power, formerly purchased from a neighboring factory, will be generated in future by a boiler in the basement of the extension. A further improvement is being made by an increase of the window area, which will save electricity and make working conditions better. The business expansion brought about by the location of several new factories in Guelph has rendered these improvements necessary.

The Canadian Appraisal Company

Limited

The Pioneer Appraisal Organization of Canada

ESTABLISHED 1905

OWING to the rapid growth of our business, we have moved into more commodious offices, and our staff, already considerable in numbers, is being largely augmented.

We are therefore able to assure prospective clients of our prompt attention to any work that may be entrusted to us.

Our unique appraisal experience in Canada, covering as it does, a period of fifteen years, and investigations of properties representing every line of industry that is carried on throughout the Dominion, qualifies us in a very special manner to undertake appraisal service of every description.

Another Tire Concern

The Lion Tire & Rubber Company, Limited, Will Build Plant in New Toronto

The Lion Tire and Rubber Company, Limited, are a recently incorporated firm who propose to erect a plant in New Toronto, on the Toronto-Hamilton Highway. The site owned by the company is one of 5 1/10 acres, and the plant will be a modern and up-to-date factory for the manufacture of fabric and cord rubber tires, as well as a line of inner tubes for all kinds of motor vehicles.

All mechanical and technical details of the company are in the hands of the Rubber Engineering Company of Akron, Ohio, but the company will operate under an Ontario charter, and the directors are all Canadian business men. The directors are:—Thomas Birkett, Ottawa; Amos Tipling, Wingham; William Castle, formerly manager of the McLaughlin Automobile Company, who will act as sales-manager for the Lion Company; J. A. Campbell, Toronto, and George Collins of Trenton.

The capitalization of the company is $2,500,000, all common shares with a par value of $10 each. There is also a bond issue of $750,000, but so far it has not been found necessary to sell any of this issue, as the shares are selling well. The company expect to commence business with a cashed-in capital of about $750,000 to be spent on buiding and equipping the plant and preliminary working expenses. The first unit of the factory, which will be started early next spring, will have a capacity of about 1,000 tubes and 500 tires a day. The head office of the company is 502 Kent Building, Toronto.

Plans are Completed

The Canada Bread Company, Limited, Have $250,000 Bakery Under Consideration

The Canada Bread Company, Limited, have had plans made by C. S. Cobb, architect, for a new bakery on Danforth Avenue, Toronto. These plans call for a fireproof building, skeleton steel construction with reinforced concrete slabs. The building is to be three storeys high, and the dimensions are 83 x 182 feet. The cost at present building prices will be about $250,000. The company have not yet decided to proceed with the construction.

A Superheater Company

The Superheater Company, Limited, Have Commenced Manufacturing Operations at Sherbrooke, Quebec

Among firms recently incorporated are the Superheater Company, Limited, capitalized at $1,000,000, with offices in the Transportation Building, Montreal, and manufacturing plant at Sherbrooke, Quebec. The products of this plant, formerly the Sherbrooke Iron Works, are the superheater now in general use on Canadian railways, superheaters for marine purposes, and the Elesco Superheater for stationary installation. Pipe coils are also made.

The company expect that the present need for fuel conservation will give emphasis to their sales arguments, an economy ranging as high as 25 per cent. being claimed for plants where the superheater is used. The present works, which are now in operation with about one hundred employees, have a capacity of five hundred superheaters a year.

Extend Rolling Mill

The Northern Aluminum Company, Limited, Build Large Addition to Their Toronto Plant

The Toronto works of the Northern Aluminum Company, Limited, are being enlarged by a new building which will triple the capacity of the rolling mill. This building is to be of the usual factory type of saw-tooth construction, about three hundred feet long with a width varying from one hundred to two hundred feet. The cost will be in the neighbourhood of $160,000 and the company hope that they will be able to commence operations in the extension early next spring. As the new construction involves certain changes in the layout of the plant, the effect on production cannot yet be estimated with any degree of accuracy. It is certain, however, that a substantial increase both in output and the number of hands employed will result.

Ruberoid Company Extends

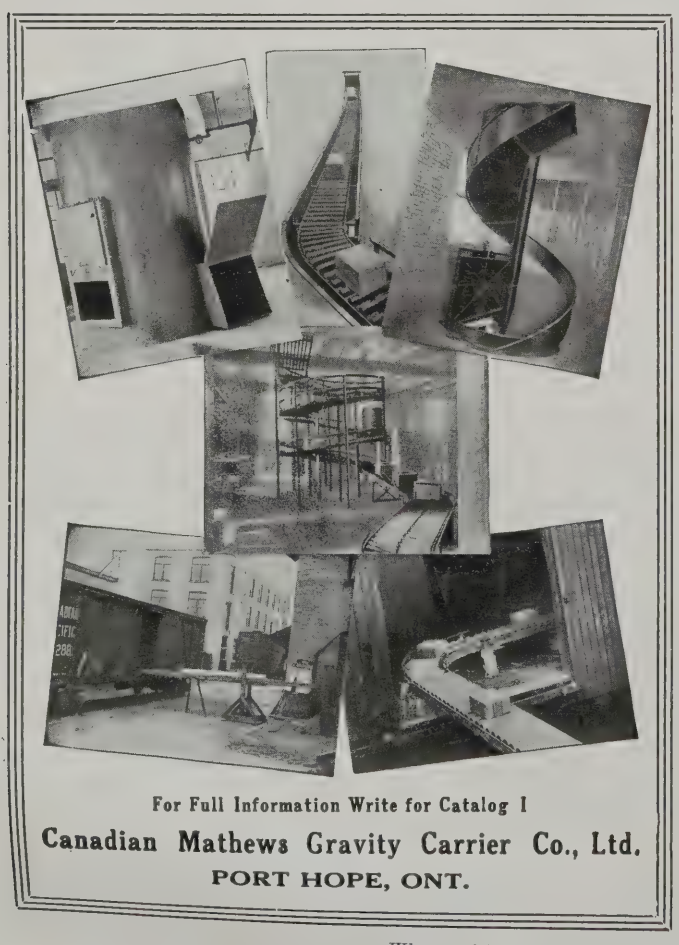
Standard Paint Company of Canada, Limited, Make Important Addition to Their Portneuf Plant

An addition of approximately 30 feet is being made to the machine room building of the Ruberoid Felt Manufacturing Company's plant at Portneuf, Quebec. In this the Standard Paint Company of Canada, Limited, who control this company, are installing twelve additional dryers with the necessary pumps and other equipment to increase the drying capacity.

The instalment of the new apparatus will be in sets of fours so the increase of production will be gradual. In September an increase should take place, and in November, when the company expect to complete the extension, the output will be about 20 tons a day, or double the present output. The estimated cost of the entire development is $42,650.

Railway Materials

International Equipment Company, Limited, Handling Canadian Manufacture of Schaefer Railway Materials



The International Equipment Company, Limited, of Montreal, are handling the distribution and Canadian manufacture of the railway materials made by the Schaefer Equipment Company. These materials are not made by the International Equipment Company directly, but they place orders with Canadian firms such as the Canadian Car & Foundry Company, Limited, financing the manufacture and looking after the sale of the finished product.

A Growing Business

Expansion of the Gray-Dort Motors, Toronto, at Chatham Ontario during Past Four Years

The Gray-Dort Motors, Limited, who commenced business in Chatham, Ontario, in 1916, have grown rapidly. The plant occupied by the Company originally had a floor space of 130,000 square feet. Enlargement of the plant has trebled this area. In June, 1916, ninety men were employed in the factory and their wages for that month amounted to $5,015.56. For the last half of April and the first half of May, 1920, the wage roll was $51,561.26, and the number of factory employees five hundred and twenty.

At present the company do all their own body building, top building and machine work, and in about three months they will own and occupy a factory where they will make all their own sheet metal.

Buy New Factory

Tarbox Bros. Acquire Plant on Morrow Avenue, Toronto, from Dominion Cone Company

Tarbox Bros., manufacturers of the "Tarbox Brand" mops, mop-sticks, mop-cloths, etc., at 1236 Dundas Street, Toronto, have recently purchased a plant on Morrow Avenue, formerly the property of the Dominion Cone Company, Limited. For some time they have needed more space than was available in their old premises, and the new factory, when a few necessary additions are made, will satisfy their immediate requirements. Eventually seventeen or eighteen thousand square feet of floor space should be developed.

Tarbox Bros. will arrange for future enlargements after rebuilding their old factory, an operation which will develop ten thousand square feet of floor space. This rebuilding will not be carried out until machinery now used at various points for custom production is collected. The number of employes, now twenty-five, will be increased with the growth of space and needs.

To Make Buttons

The International Button Company, Limited, Complete Organization and Buy Plant in Smith's Falls

The International Button Company, Limited, are now organized and have purchased a building in Smith's Falls, Ontario, where they will start manufacturing ivory buttons for knitted goods, waterproof goods, ladies' costumes, etc., about the end of September. The size of the present building gives the company about 10,000 square feet of floor space, and fifty hands, male and female, will be employed. Later on they hope to build a plant specially adapted to the requirements of button manufacturing.

The authorized capital is one hundred thousand dollars. The officers are: President, W. C. Thompson, Montreal; vice-president, W. S. Murphy, Smith's Falls; secretary-treasurer, H. F. Shearer, Smith's Falls; directors, H. H. Cromwell, F. Hunter, Montreal, and M. G. Henniger, Smith's Falls.

Building New Plant

The Canada Decalcomania Company, Limited, Propose to Erect a $90,000 Factory in Toronto

The Canada Decalcomania Company, Limited, who are at present located at 364-370 Richmond Street West, Toronto, purpose to erect a new building on King Street East at an approximate cost of $90,000. This factory will have three storeys and a basement, and will measure 63 by 148 feet. The company expect to move in from their Richmond Street quarters some time in the autumn of 1920, and will continue the manufacture of Decalcomania transfer labels and advertising signs in the new plant.

INDUSTRIAL KITCHENS

The furnishing of equipment for Industrial Kitchens is a specialty of McCLARY'S. Every detail, and there are many, has been mastered by our experts; large or small, complicated or straightforward specifications, are handled with equal care.

During the past few years we have had a large experience in this class of work. Architects and buyers of this equipment have proved to their entire satisfaction that McCLARY'S activities are not solely confined to the manufacture of Good Stoves and Cooking Utensils.

The development of the Cafeteria or Cafe for industrial organizations has been very rapid of late. Employers of labor realize that this system of having pure, healthful food available for sale at reasonable prices, right within convenient reach, is very beneficial to the moral of their workmen.

It is not sufficient, however, to merely approve the establishment of this new departure; it is very essential that no risks should be taken in its satisfactory installation.

It is with perfect confidence that we, McCLARY'S, offer our services to any architect or buyer who desires to obtain specification, layouts and prices without obligating himself. Our experts are ready at any time to give their personal and courteous attention to any enquiry submitted.

Our nearest branch will deal promptly with a written request.

Fabric Manufacture

The Oriental Textile Company, Limited, Plan to Erect $150,000 Plant at Oshawa

The plans for the building which the Oriental Textiles Company, Limited, are erecting at Oshawa, Ontario, are now complete and call for a plant 80 by 76 feet, three storeys, mill construction. Additional two-hundred-and-fifty horse-power boilers will be installed for the manufacture of plushes and velours, and the additions and improvements when completed will cost approximately $150,000. As much difficulty has been experienced in securing machinery, the date for beginning operations in the new plant cannot yet be given, but when it is in working order the company expect to be able to double their present production.

Plow Company Extends

Cockshutt Plow Company, Limited, Building Addition to Their Blacksmith Shop

The Cockshutt Plow Company, Limited, are building a $50,000 extension to their Brantford plant. The building, which will be used for making steel forgings and general blacksmith work, has become necessary on account of the substitution of steel forgings for malleable and cast parts. The dimensions are 70x200 feet; the construction is steel with high roof and excellent ventilating equipment for removing heat and gases from oil furnaces. Through this expansion the capacity of the department will be increased approximately 40 per cent. It should be completed by the first of October.

Building New Mill

B. C. Spruce Mills, Limited, Complete Organization and Start Work on New Plant

The organization of the B. C. Spruce Mills, Limited, is now complete and the construction of a large saw mill and planing mill at Wattsburg, B. C., is to be started immediately, and should be in operation next year. The capacity of the mill will be 150,000 feet, single run. Besides the plant the company are erecting a modern town which will have about one hundred houses for employees, a large store, warehouses, school, amusement hall and other buildings.

The capitalization of the company is one million dollars and Wisconsin and Michigan lumbermen are the organizers. The officers are: B. F. Wilson, president; W. F. Baker, vice-president, M. P. McCullough, secretary; A. P. Woodson, treasurer; and S. C. Robson, general manager.

Re-commence Operations

The Frontenac Floor and Wall Tile Company, Limited, Making Ceramics at Kingston

The Frontenac Floor and Wall Tile Company, Limited, has re-commenced manufacturing operations at Kingston, Ontario. The output at present is confined to white ceramics but the company contemplate installing during the near future all the equipment necessary for producing a full line of ceramic colours. Already a good organization has been built up and the company are shipping their product in ¾" squares and 1" hexagon sizes.

The company have as general manager Everett Townsend, who for the past twenty-five years has been general manager of the Robertson Art Tile Company in Morrisville, Pennsylvania, and thoroughly understand all branches of the tile business. They are prepared to furnish quotations and details on enquiry.

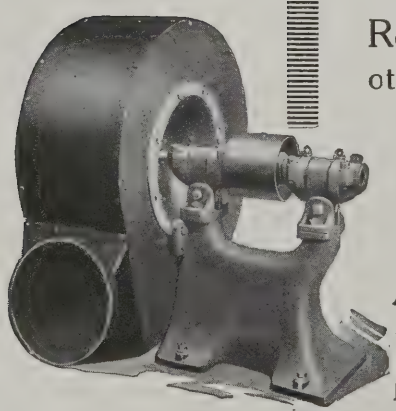
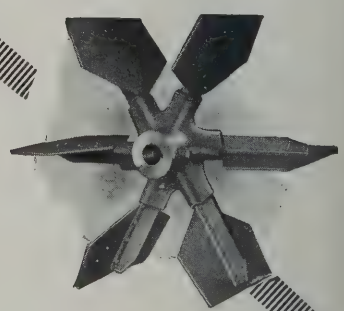
Japan Using More Labor-Saving Machinery

Wages have advanced so much in the last two or three years that it now pays to use many kinds of labor-saving machinery.

As an example I may say that a hired man on a farm now gets Y2.50 to Y3.00 per day. A man who can drive a horse receives Y5.00 per day in the Hokkaido. The coolies working on the docks now receive Y4.00 to Y5.00 per day. A woman on a farm in Hokkaido now gets Y1.00 to Y2.50 per day. It costs the farmer Y2.50 per day for the upkeep of his horse. We find, therefore, that the people are beginning to use gasoline tractors, motor trucks, American agricultural implements, and many labor-saving machines in the factories.



While wages have advanced some 85 per cent. on pre-war figures, it is of interest to note that the prices of commodities in Japan in March this year, according to the index number issued by the Bank of Japan had increased 237 per cent. since 1914. Wages must therefore continue to advance, the tendency being for wages always to follow a rise in the cost of living.



As pointed out before this evening the efficiency of three Japanese workmen would be about equal to two Canadian—in fact some foreigners who have been in charge of factories in Japan figure that one Canadian or Englishman would do the same work in the same time as two Japanese. However, this is very difficult to gauge correctly.

Coal which in 1914 cost Y4.25 per ton, now costs the manufacturer Y18.00 to Y20.00 per ton. Mr. Crowe estimates that the consumption of coal in Japanese factories must be about 12,000,000 tons per annum.

Trade Unions

Trade unions are beginning to make themselves felt, although Unions as we know them are not legal in Japan. But, nevertheless, workmen have begun to co-operate against employers and have during the past few months made themselves keenly felt. Just lately a strike at the Yawata Steel Co., which is owned by the Government, threw 30,000 men out of work, while numerous other strikes have taken place in and around Tokyo and Osaka—in nearly every case the men wanted an increase of from 50 to 100 per cent. in wages and

Ker & Goodwin Machinery Co. LIMITED
BRANTFORD, Ont.

shorter hours. So you see Japan is not without its labor troubles any more.

As shown you before this evening, Japan is devoid of those essential raw materials needed for manufacturing—such as iron ore, lumber, raw cotton, wool, in fact she now must import all her raw materials with the exception of silver, copper and coal which is very expensive.

Japanese industry is still really in a state of transition from the cottage to the factory system. This will for some time to come affect the quality of and uniformity of her goods.

I think you will see that we have nothing much to fear as regards competition from Japan.

Conclusion.

I know that what I have said is a very imperfect description of trade conditions between yourselves and Japan. There are probably some points which I have not discussed, but with reference to which some of you may wish enlightenment. As I mentioned in the beginning of this address I will be glad to see any of you personally and will do my best to explain any difficulties you may have in your dealings with Japan.

I hope, however, that I have at least aroused a little interest in our Great Little Neighbor Japan and that such being the case, you will think fit to prepare now for shipments along the lines recommended this evening.

In conclusion let me recapitulate the chief points upon which I endeavored to lay emphasis this evening:

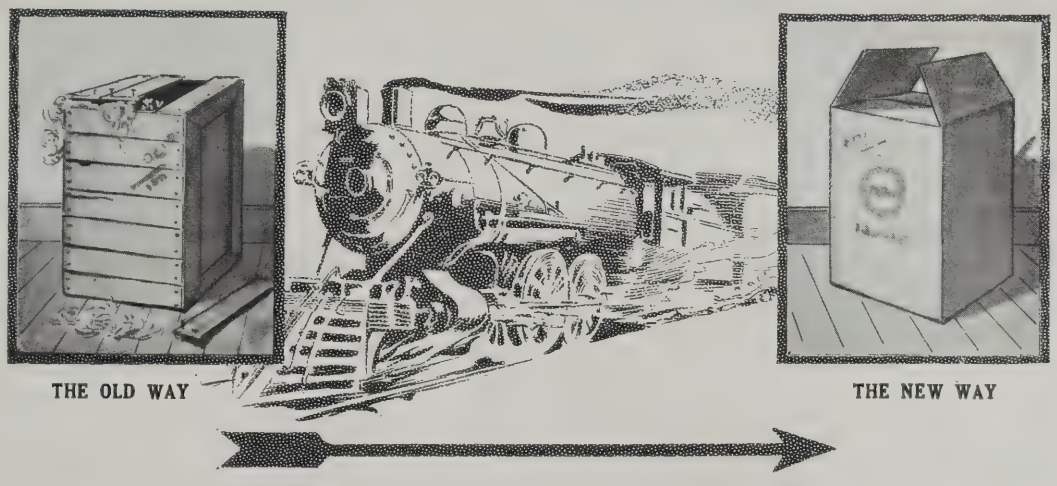
1.—WHY SHOULD WE TRADE WITH JAPAN?

1. Its close geographical position.
2. Its strong financial position.
3. Its favorable position to us as regards supplies and demand.

2.—PRESENT EXTENT OF CANADA'S EXPORTS TO JAPAN.

And consideration of the main articles exported from Canada.

1. Other lines not mentioned in our returns but which we could export to Japan.



3.—WHY CANADIAN BUSINESS IS SMALL.

1. No Canadian export houses with their branches in Japan.
2. Lack of Canadian salesmen to show their goods and study the requirements of the market.
3. Correspondence has not been complete in the information submitted *re* prices, c.i.f. costs, etc.
4. Our packing and grading not up to 100% efficiency.
5. We have not all been marking and invoicing in the correct way.
6. Our goods not all up to sample.
7. Our deliveries not as prompt as they should be.
8. Lack of appreciation of the potentialities of this market.
9. Some firms have a prejudice about dealing with Japanese.

4.—WHAT WE MUST DO TO INCREASE OUR SALES TO JAPAN.

1. We must correct all the deficiencies in our organization just mentioned—that is we must have—
   (*a*) Salesmen;
   (*b*) Canadian branch houses for agents or export associations to export.
2. We must be content with small profits and big turnovers.
3. We must make our transportation and harbor facilities 100 per cent. perfect.
4. You must decide to build branch factories in British Columbia to handle your trans-Pacific business.
5. You must enlarge the foreign operations of your Canadian Banks—there should be one other good one in Japan.

H. & D. Corrugated and Solid Fibre Board

CONTAINERS will save on your transportation charges, save your floor space, cut down packing expenses, and give you positive protection against loss from damage and pilfering. Write for prices and samples.

Steel for Permanence

The All Steel Elevated Water Tank is the most economical installation for Automatic Sprinkler systems for fire protection, general mill supply, or Municipal Water Works systems.

Its first cost is not excessive, the maintenance expense is very low, and there is no danger of leakage, falling ice, or possibility of the tank bursting or catching fire.

Hundreds of our All Steel Elevated Water Tanks now in service throughout Canada bear witness to these facts.

OUR PRODUCT IS MADE IN CANADA

5.—You must appreciate the difficulties under which your branches or agents in Japan operate—

(*a*) High import tariff;
(*b*) Trade mark registration;
(*c*) Government monopolies.

6.—You need have no fear of competition from Japan, particularly in high-class goods.

Finally, let me say that I hope I will have the pleasure of talking with you one and all personally—I want to know every manufacturer in Canada—and I want you all to feel that you know me—and my parting will be in Japanese: "Shokun naga dangi wo motte omimi wo wazurawashimashita—Gomen Kudasai," I have troubled your honorable ears with my long speech—please pardon me.

Paint and Varnish Industry

Report of Mining, Metallurgical and Chemical Division of the Dominion Bureau of Statistics

Over $17,000,000 worth of paints and varnishes were manufactured in Canada during 1918, according to a report published Sept. 2nd from the Mining, Metallurgical, and Chemical Division of the Dominion Bureau of Statistics. In the same time Canada imported over $6,000,000 worth of paints, varnishes, and materials used in the paint and varnish industry. Of this sum $1,000,000 was spent in gums; nearly $2,000,000 in white zinc, and over $1,000,000 in rosin. Forty-five establishments were operated during the year with an aggregate capital investment of $15,784,610.

The report gives detailed information regarding the numbers and compensation of the officers, superintendents, clerks, and wage-earners according to classes, and also shows the quantities and values of materials used in the manufacture of the products which are listed by quantities and values.

This report, one of a series of advance chapters dealing with the production of chemicals and allied products in Canada during the year 1918, is available for free distribution to those interested. Requests should be addressed to the Dominion Bureau of Statistics, Ottawa.

Expansion at Petrolia

The Orton Motor Company, Limited, Remodel Plant and Plan New Addition

The Orton Motor Company, Limited, with offices and factory at Petrolia, Ontario, are remodelling their plant and preparing to erect a new building during the autumn of this year. The remodelling of the present plant, which is now well under way, should be far enough advanced by the end of October to put the company on production. The new building is designed for the manufacture of tops, side curtains and other fittings, space in it also being provided for the finishing and trimming departments. It is to be of brick, 100 by 200 feet, with large steel sash and windows. The cost will be approximately one hundred thousand dollars.

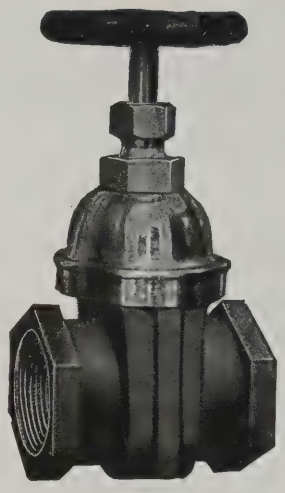
The company is very optimistic about the future prospects of the motor manufacturing industry in Canada. The president, Mr. A. Orton, says in a statement sent to INDUSTRIAL CANADA: "The automotive industry throughout the whole country was never in a more satisfactory state. Practically every manufacturer, distributor and dealer is making money and is on a sound financial basis. I am convinced that there is no country in the world that offers greater inducements to invest in automotive securities than Canada. The growth of the industry has been phenomenal." Mr. Orton has recently finished an extensive survey of the industry both in Canada and in the United States.

METHYLATED SPIRITS
(Denatured Alcohol)

CANADIAN INDUSTRIAL ALCOHOL COMPANY LIMITED

DURING the last session of parliament, the Inland Revenue Act was amended so that the sale of Methylated Spirits (denatured alcohol) is no longer controlled and carried on by the Department of Inland Revenue.

Our Distillery at Corbyville, Ontario,—the largest Industrial Alcohol plant in the British Empire—is fully equipped and thoroughly organized to serve manufacturers who use Methylated Spirits or Denatured Alcohol.



We will be pleased to place at your disposal the advice of our chemists in regard to the use of specially denatured alcohol. One of these formulas may prove more suitable in your business than that which you are now using.

We also manufacture Ethyl Alcohol, Cologne Spirits, Fusel Oil and Non-Potable Alcohol.

All orders received by us will be given the prompt and careful attention that only an organization such as ours can give.

Important Soil Fertility Conference

215 Manufacturers, Salesmen, Agents and Guests of the Canadian Fertilizer Industry Hold a Conference at the Ontario Agricultural College

IF the progressiveness of an industry can be judged by the degree to which its manufacturers and selling forces clamor after information, the Canadian Fertilizer industry should rank as a leader among our industries. Late in June its forces—manufacturers, salesmen, agents, guests and friends to the number of 215—gathered at the Ontario Agricultural College to listen to a programme provided by the Soil and Crop Improvement Bureau of the Canadian Fertilizer Association in co-operation with the staff of the Ontario Agricultural College. This is a step unique in the annals of Canadian industries. It is an instance of a whole industry going to school.

Why was this second Annual Fertility Conference so important?

First—Because its entire deliberations dealt with foundation stones of Canadian business. Henry G. Bell, Director of the Soil and Crop Improvement Bureau and chairman of the conference, said in his opening remarks "Canadian soils are valuable only in so far as they will produce food for man and beast; on the degree of their productiveness depends the progress of rural Canada, and the prosperity of our manufacturing centres. Remember that the larger and the better the crops of Canada are, the greater is the buying capacity of Canada as a whole."

Second—Because taking something from something often enough leaves nothing. Canadian farmers are expert miners. They are raising and selling, raising and selling, till the drain upon the resources is being felt. To be specific, the weight of nitrogen, phosphoric acid and potash (three essential crop foods) removed from Ontario soils by 1919 crops, would load to capacity 100 freight trains of 100 cars each. A small amount of fertility is being returned in stock manure; some nitrogen through growing of legumes, and comparatively little of all three plant foods in fertilizers. Nevertheless there is an increasing deficit year by year.

Third—This is one of the first instances of educational institutions and business arriving at a common viewpoint.

For these and other reasons this Conference bespoke intelligent progress in the building up of Canadian industry—both farming and manufacturing—along lines which are sound and designed for permanency.

Mr. Moffat, manager Gunns, Limited, West Toronto, speaking for the Canadian fertilizer manufacturers, said that the industry in Canada was very anxious to develop the manufacture of fertilizers and their sale along scientific and logical lines. It was not a case of putting all the attention on getting out a maximum of product at a minimum of cost. The Canadian fertilizer manufacturers had gone far beyond this in that they had—at considerable expense—established an educational bureau whose chief endeavor it was to direct Canadian farmers into most productive paths, and especially to disseminate reliable information regarding the upkeep of the fertility of the soil and the proper use of fertilizers.

Dr. H. O. Buckman, of the Soils Department, Cornell University, and Prof. Robert Harcourt, Chemist of O.A.C., dealt with technical discussions of chemistry, physics and soil biology bearing directly on the question of maintaining the fertility of our soils and obtaining greatest returns from them. Dr. Buckman brought out a very strong point, based on Cornell investigations, in condemnation of a common farm

practice in Ontario. He showed that the loss of plant food from soil that is summer fallowed is many times greater than from the same soil under a judicious system of cropping. He very strongly recommended the liberal use of high-grade fertilizers.

Henry G. Bell, Director of the Bureau, brought out some very important points bearing on Ontario farming practice, the most important of which were:

1. While legumes add some nitrogen to a soil, they do not supply other important plant food constituents; therefore it is impossible to keep up the fertility of the soil by growing clover.

2. It is not most profitable to buy plant food in its cheapest form at all times. Cheap phosphates, such as basic slag, have a place; but to attempt to obtain largest and most profitable yields of such money crops as wheat, corn, potatoes and tobacco with such a low grade source of phosphate has been shown impossible by long-time experimentation at Ohio, Indiana, and other experiment stations.

Mr. Bell, who was formerly Professor of Soils and Crops, University of Maine, quoted from his extensive observations throughout the northern half of this Continent. He instanced the rapid strides in farm improvement in Indiana, Ohio, Missouri and, in these later years, in prominent sections of Ontario, as indicative of what beneficial results could be obtained if more Ontario farmers put into operation well-founded practices of soil fertility management. The important work Prof. Bell has developed for the Canadian fertilizer industry is aimed especially at disseminating this valuable information.

Trade With France

The Canadian Section of the British Chamber of Commerce at Paris Can Assist Exporters

Amongst British Chambers of Commerce established abroad, that of Paris is conspicuous for its enterprise in serving the requirements of British Trade and Industry, and, furthermore, it possesses a very active Canadian Section.

The Committee of this section is composed of persons themselves interested in trade with Canada, and consequently is in a position to supply all the requirements of Canadian members. The membership of the Chamber is restricted to firms of British nationality, it receives no subsidy from the Canadian or British Governments, and carries on its most necessary work entirely through the subscriptions of its members. To enable the Chamber to take up a firm position and thus sufficiently combat foreign competition, it very naturally deserves to continue to add to its membership.

Amongst other things, it puts its members into touch with suitable agents in France, obtains information on the Commercial standing of French firms, supplies exact Customs classification of goods, notifies changes in French customs duties and proposed commercial legislation, communicates enquiries from French buyers of British goods and, furthermore, publishes a very useful bulletin of information.

Applications for membership should be made to the Secretary of the Canadian Section, British Chamber of Commerce, Incorporated, 6, rue Halévy, Paris.

Trans-Canada flying will be inaugurated within a year's time according to a statement made by Major R. D. Hobbs, Dominion Inspector of Civil Aviation. Surveying of a coast to coast route is practically completed in certain districts, he said.

Book Reviews

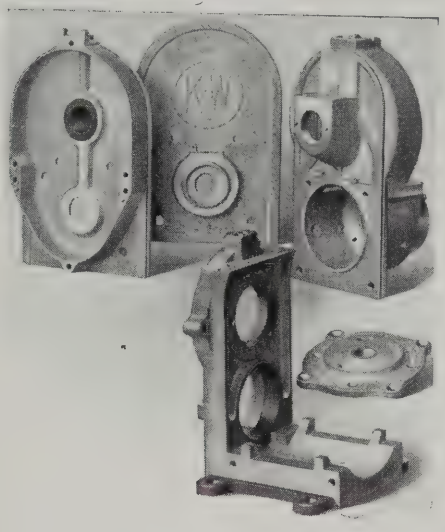
Australia's Water Conservation

Harnessing Australia's Greatest River; Supplement to the *Industrial Australian and Mining Standard.* Melbourne, June 17th, 1920.

Of particular interest to Canadians who are anxious to see our own great resources of water-power fully developed is this account of what the Commonwealth of Australia is doing in that direction. The River Murray is over fifteen hundred miles long, rising in the Snowy Mountains of Victoria, and flowing through the States of Victoria, New South Wales and South Australia to the sea. The river, for the greater part of its course, flows through comparatively level country; harnessing the stream for the production of power is therefore out of the question. But the water can be used for irrigation, and the River Murray Commission was appointed to perfect plans for this purpose. "The scheme," says L. E. Groom, president of the commission, "may be said to be now fairly launched, the main works having been started. Every endeavor will be made by the four contracting parties to the agreement (the Commonwealth and the three States) to ensure the completion at the earliest possible date of these great national works, but it must be recognized that an engineering problem of such magnitude of necessity demands much care and time for completion. When the scheme covered by the agreement shall have been finished, the greatest river in the Commonwealth will be harnessed for the purposes of man, and the result will be a vast addition to the area of land capable of irrigation, security and regularity of supplies of water, the establishment of new settlements, increased production, and the making available for the purposes of the producers of the River Murray valley of a permanent navigable highway of over 1000 miles."

The supplement gives a detailed account of the history of the scheme, the engineering problems, and the way they have been solved. The account is illustrated with maps, plans and photographs, and gives the reader as good an idea of this tremendous development project as one can get without being actually on the spot. The work of the River Murray Commission is an important chapter in Australian history, and the *Industrial Australian and Mining Standard* has had the honor of writing it.

Pulp and Paper



A Handbook of the Canadian Pulp and Paper Company; Montreal, 1920, the Canadian Pulp and Paper Association.

The many facts, historical, technical, financial, that are available concerning the pulp and paper industry in Canada, have been collected and summarized in a form convenient for purposes of reference. The publishers of the handbook, while not guaranteeing the statements it contains, have taken them from trustworthy sources and believe them to be reliable. Assistance in its compilation was rendered by several Dominion and Provincial Government Departments. Photographs and statistics were furnished by various Canadian pulp and paper companies.

The historical outline in the first chapter is followed by a census of the industry which shows how great a growth has taken place in recent years. A chapter on pulp and paper securities, prepared in part by the Royal Securities Corporation, Limited, gives valuable statistics for the prospective investor. The publication as a whole is artistic in make up and illustrations, and should appeal to all persons interested in the development of Canada's natural wealth.

Information for Exporters

Exporter's Gazetteer of Foreign Markets; compiled by Lloyd R. Morris, New York, the American Exporter.

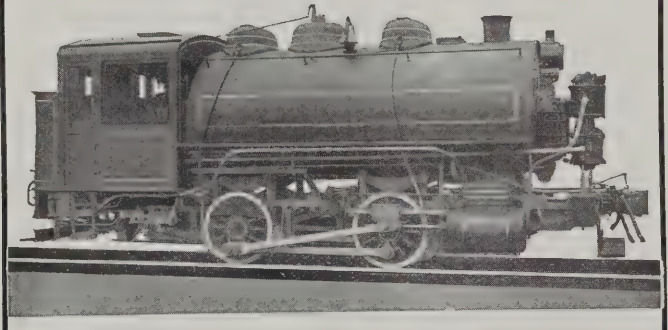
This volume is a reference guide to the imports and exports industries, shipping, banking, products, climatic and other local conditions of foreign markets. As the word, foreign, in this connection is relative to the United States, the book does not deal as fully with that country as with the others. Canadian exporters, however, will find the information and statistics about the remaining foreign markets to be as useful to them as to their southern competitors.

The Gazetteer is a handsomely bound book of 808 pages. In addition to the tables, a number of charts, a map of the world, a map of the New Europe and live maps of each of the markets are included.

Boiler Room Economy

The Combustion Chamber, August 1920. Monthly magazine published by the *Underfeed Stoker Company of Canada, Limited, and the Underfeed Stoker Company of America.*

This attractive little house organ should be seen by all who are interested in boiler room economy. The leading article in the August issue is by Dean P. F. Walker of the School of Engineering, University of Kansas. In it he describes the experiences he had in operating James Underfeed Stokers at the power plant of the University of Kansas. The installation was found unsatisfactory at first, owing to the high percentage of non-combustible refuse and sulphur in the coal being used. Tuyere blocks were frequently burned out and the plant was far from efficient. Mr. Walker studied the situation and found that the fault did not lie in the equipment but in the way it was being handled. He conducted a series of tests, and discovered the proper method of stoking to suit the particular circumstances. As an example of the "process of education that is frequently necessary when high-grade apparatus is put into service," the story in its entirety is well worth reading.



Fire Alarm Publications

The Northern Electric Company has just issued two new fire alarm bulletins. One of these describes fire alarm systems for municipalities; the other, fire alarm systems for industrial plants, schools, hospitals, hotels and public buildings.

The intricate and important problems connected with fire protection are treated in detail with descriptions and illustrations of the various systems and equipment used. The books also contain some very vital statistics on fire losses and an outline of the history of fire alarm development. They are excellently printed on first-class stock and cover designs are in an appropriate scarlet; appearance and contents combining to make a most impressive exposition of an impressive subject.

Sample copies of both publications were distributed to the Fire Chiefs at the International Fire Chiefs' Convention recently held at Toronto and met with very favorable comment. The Northern Electric Company will gladly send copies to any parties interested.

ROUND STEEL WELDED TANKS
Top End Open

Made any gauge iron from 20 G. to 5-32″ plate, welded throughout, making them like a one-piece tank, therefore cannot leak. Formerly these tanks were riveted and, as they were made of black iron, they could not be soldered and were therefore very liable to leak, in fact the lighter tanks could not be made leak-proof, but the new welding process has changed all this and we can now give you a tank that we can guarantee absolutely. We specialize on heavy tanks for manufacturers, finished round top with heavy angle steel if so desired.

SQUARE WELDED STEEL TANKS

Made any size or shape to suit. Being welded throughout they are just like one piece of tank, and there is no chance of leakage as with the riveted tank. We can supply these up to 10G or 1-8″ plate. We finish them around top with heavy angle steel and the larger ones with extra cross and upright braces. Can supply any necessary Pipe Fittings.

Also Air Pressure and Gasoline Tanks

British Engineering Standards Association

Specifications Now Available—List of Recent Publications Obtainable From the Secretary, Canadian Engineering Standards Association

THE Secretary of the Canadian Engineering Standards Association announces that a stock of a number of the most important publications of the British Engineering Standards Association has now been received, and is available for distribution. The following list does not include all publications of the British Engineering Standards Association, but covers those of recent issue which have been published under the new regulations. Copies are for sale at the prices stated below and may be obtained from the Secretary, Canadian Engineering Standards Association, Room 112, West Block, Ottawa.

REPORT NO. B.E.S.A. PUBLICATIONS.

C.L.2582—*Interim Report on British Standard Sizes of Single Row Ball Journal Bearings for Automobile.* 15c net.

Gives inch sizes for light and heavy type bearings for shafts from ¼ to 4½ ins. diameter, and metric sizes for light, medium, and heavy type bearings for shafts from 10 mm. to 110 mm. diameter.

C.L.3750—*Interim Memorandum on French Metric Screw Threads for Aircraft Purposes.* 15c net.

This Memorandum describes the system of screw threads for aircraft purposes used by the French military authorities, and is accompanied by tables showing limits of size, tolerances, etc., for two grades of fit. The form of thread is that of the Systeme International, in which the crest is cylindrical while the root of the thread is curved in section. The finer tolerances are provided for cases where great accuracy is required. The second-grade tolerances are suitable for ordinary bolts and nuts.

REPORT NO. B.E.S.A. PUBLICATIONS.

C.L.7130—*British Standards for Annealed Copper Conductors for Electric Power and Light (up to 1 square inch area).* 15c. net.

Gives diameter, area, weight, and resistance per 1,000 yards, for circular wires, single and stranded circular conductors for flexible cords, and conductors for flexible cables.

C.L.7270—*Interim Report on British Standard Whitworth (B.S.W.) Screw Threads and their Tolerances (¼ inch to 6 inches dia.) (Superseding Reports Nos. 20 and 38.)* 25c. net.

This import report gives the British standard nomenclature and definitions referring to screw thread work, also standard dimensions of B.S.W. threads, followed by tables of standard sizes and tolerances, for both bolts and nuts, on pitch, angle, full diameter, effective diameter, and core diameter.

A. R. CLARKE & CO., LIMITED

MONTREAL TORONTO QUEBEC

REPORT NO. B.E.S.A. PUBLICATIONS.

C.L. (M) 7271—*Interim Report on British Association (B.A.) Screw Threads with Tolerances for Nos. 0 to 15 B.A.) (Superseding Report No. 20).*
25c. net.

Gives similar information to that contained in C.L. (M) 7270, but applying to B.A. threads from .010 to .236 inch full diameter (0.25 to 6.0 mm.)

3-1903—*Report on the Influence of Gauge Length and Section of Test Bar on the Percentage of Elongation, by Professor W. C. Unwin.*
25c. net.

This report deals with the variation of percentage of elongation with different gauge lengths and sections of test bar. The tests cover a wide range of conditions, and no such complete information as to variation of elongation with the form of test bar has been previously available.

6-1904—*Properties of British Standard Sections for Structural Steel.*
25c. net.

This important and complete report is likely to undergo revision in the near future, as an endeavor is being made to obtain a larger measure of agreement between British and American standard sections.

7-1919—*British Standard Specification for Dimensions of Insulated Annealed Copper Conductors for Electric Power and Light Including Pressure Tests.*
25c. net.

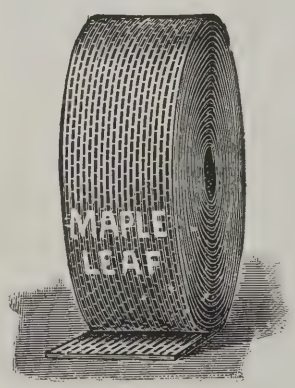
This specification does not deal with the composition, quality or durability of the insulating material used as the dielectric, but covers definitions, sizes, and electrical characteristics for solid and stranded conductors, with particulars of dielectric and sheathing. Standard tests are also described.

8-1904—*British Standard Specifications for Tubular Tramway Poles.*
25c. net.

Three grades of steel pole are described as regards dimensions, material and tests.

10-1904—*British Standard Tables of Pipe Flanges.*
25c. net.

This report gives the British standard dimensions for pipe flanges for steam and water piping for low pressures and high pressures, dimensions of welded-on flanges for pipe lines, for working steam pressures of 125, 225, and 325 lbs. per square inch, dimensions for short flanged bends and tees of cast metal for pressures up to 325 lbs. per square inch, and dimensions for long bends of wrought iron and steel.



12-1915—*British Standard Specifications for Portland Cement.*
25c. net.

Governs composition and manufacture, with methods of sampling and testing cement, and describes the apparatus needed for making tests according to the standard methods.

13-1910—*British Standard Specifications for Structural Steel for Shipbuilding.*

Covers manufacture, physical properties, testing, and inspection methods.

REPORT NO. B.E.S.A. PUBLICATIONS.

14-1907—*British Standard Specifications for Structural Steel for Marine Boilers.*
25c. net.

Covers manufacture, physical properties, testing and inspection methods.

15-1912—*British Standard Specifications for Structural Steel for Bridges, etc., and General Building Construction.*
25c. net.

Covers manufacture, physical properties, tests, and inspection methods.

18-1910—*Forms of British Standard Tensile Test Pieces.*
25c. net.

This report is published separately, but is also included as an appendix to Reports Nos. 13, 14, 15, 24, 29, 47, 48, 51, 64, 66, 75, and others.

21-1909—*Report on British Standard Pipe Threads for Iron or Steel Pipes and Tubes. (Revised Nov., 1909).*
25c. net.

This report gives definitions and tables of dimensions for British Standard Pipe Threads. In this system the Whitworth form of thread is employed, but fine pitches are used, and both parallel and conical screw ends are provided for.

23-1905—*British Standards for Trolley Groove and Wire.*
25c. net.

Gives dimensions of standard trolley wheel groove, and recommends minimum tensile breaking strength for various sizes of wire.

REPORT NO. B.E.S.A. PUBLICATIONS.

24-1911—*British Standard Specifications for Railway Rolling Stock Material. Part 1.—Locomotive Carriage and Wagon Axles. (Revised, December, 1911).*
Pt. I.
25c. net.

Alternative specifications (with and without limits on sulphur and phosphorus) are given for locomotive axles (crank and straight) and for carriage and wagon axles.

24-1911—*British Standard Specifications for Railway Rolling Stock Material. Part II.—Locomotive, Carriage and Wagon Tyres. (Revised, December, 1911).*
Pt. II.
25c. net.

Specifications are given for locomotive tyres (with chemical analysis) and for carriage and wagon tyres (both with and without analysis).

24-1911—*British Standard Specifications for Railway Rolling Stock Material. Part III.—Laminated, Volute and Helical Springs and Steel for Laminated Springs. (Revised, December, 1911).*
Pt. III.
25c. net.

Gives alternative specifications (with and without chemical analysis as to carbon sulphur and phosphorus) for each of the above.

24-1911—*British Standard Specifications for Railway Rolling Stock Materials. Part IV.—Steel Forgings, Blooms and Castings. (Revised, December, 1911).*
Pt. IV.
25c. net.

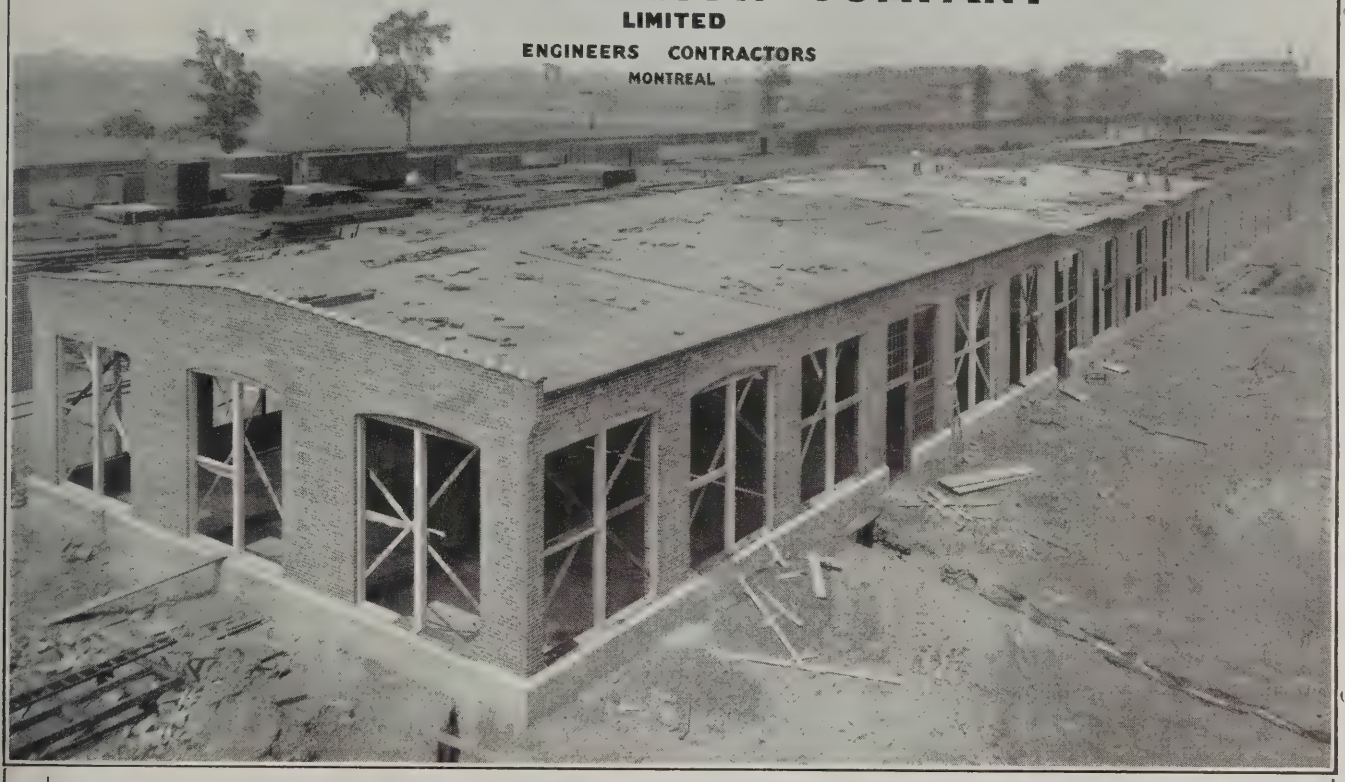
Covers steel forgings for locomotives, steel blooms for locomotive forgings, and steel castings.

For Problems of Factory Expansion

Are you confronted with the problem of providing for increased factory space?
Sparling Service has the men and the experience at its command to provide a complete and efficient building service to you.

Sparling Service

would relieve you of unnecessary worry, delay and expense. It would adequately provide for the extension required without confusion and with the minimum interference with your current operations.
By the execution of the whole scheme under one complete organization, Sparling Service assures you intelligent and economical construction.
The Sparling organization has demonstrated its ability to deal with the intricate and diversified building problems of industry in a scientific and satisfactory manner.



If you are considering factory extensions, consult "Sparling Service." Our advice entails no obligation.

REPORT No. B.E.S.A. PUBLICATIONS.

44-1909—*British Standard Specification for Cast Iron Pipes for Hydraulic Power.* 25c. net.

Provision is made for two classes of this pipe, together with bends, tees, and special castings—Class A.: Working pressures from 700 to 900 lbs. per sq. inch; Class B.: Working pressures from 900 to 1,200 lbs. per sq. inch. The specification covers quality of material, permissible variation of weight, marking, testing, inspection, and tables of dimensions and weights.

45-1917—*Report on British Standard Dimensions for Sparking Plugs for Internal Combustion Engines. (Revised, September,* 1917). 25c. net.

This report covers external dimensions only, the form of thread used being a metric thread having a 60 degree angle; tolerances on full diameter, effective diameter and core diameter for the thread on the plug and in the tapped hole are given, together with external dimensions of the complete plug, and standard nomenclature of sparking plug parts.

46-1909—*British Standard Specifications for Keys and Keyways.* 25c. net.

The specifications cover material, tests, definitions and tables of dimensions for three classes of key; (*a*) Parallel Sunk Key; (*b*); Taper Key; (*c*) Taper Sunk Key.

47-1919—*British Standard Specification and Sections for Steel Fishplates for British Standard Bull Head Railway Rails (For rails from 70 lbs. to 100 lbs. per yard, inclusive); And for British Standard Flat Bottom Railway Rails (For rails from 25 lbs. to 100 lbs. per yard, inclusive). (Revised, June,* 1919). 25c. net.

Specifies quality and chemical composition of steel, tests, manufacture, and inspection, and gives tables of standard dimensions.

48-1909—*British Standard Specification for Wrought Iron of Smithing Quality for Shipbuilding—Grade D.* 25c. net

Covers physical properties, tests, manufacture, and inspection for puddled wrought iron bars.

51-1913—*British Standard Specification for Wrought Iron for Use in Railway Rolling Stock, "Best Yorkshire" and Grades A, B and C. (Revised, Aug.,* 1913). 25c. net.

Covers physical properties, tests, manufacture, and inspection of puddled wrought iron plates, bars, angles, and other sections; also for billets and blooms for certain grades of material.

53-1913—*British Standard Specification for Cold Drawn Weldless Steel Tubes for Locomotive Boilers. (Revised, August,* 1913). 25c. net.

Covers material, manufacture, physical and chemical properties, tests and inspection.

59-1912—*British Standard Specification for Cast Iron Spigot and Socket Waste and Ventilating Pipes for Other Than Soil Purposes.* 25c. net.

Gives specification, and tables of dimensions for pipes, bends, branches, inspection doors, sockets and other special fittings.

REPORT NO. B.E.S.A. PUBLICATIONS.

61-1913—*British Standard Specification for Copper Tubes and Their Screw Threads (Primarily for domestic and similar work).* 25c. net.

Deals with three classes of tube for low, medium and high pressure, and covers composition, tests, and standard sizes, with specifications for suitable screw threads giving complete dimensions.

62-1913—*British Standard Screwing for Marine Boiler Stays.* 25c. net.

Recommends the use of Whitworth form of thread, either six or nine per inch, according to size of stay.

63-1913—*British Standard Specification for Sizes of Broken Stone and Chippings.* 25c. net.

This specification was formulated as a result of conferences between the quarry owners and read authorities, and gives standard nomenclature, definitions and methods of measurements for broken stone and chippings.

64-1913—*British Standard Specification for Steel Fishbolts and Nuts for Railway Rails.* 25c. net.

Covers physical properties and manufacture, tests, and inspection for carbon steel bolts.

65-1914—*British Standard Specification for Salt-Glazed Ware Pipes.* 25c. net.

This report contains tables of dimensions and particulars regarding sockets, grooving, glazing, permissible variation in thickness and diameter, methods of testing for strength and absorption.

REPORT NO. B.E.S.A. PUBLICATIONS.

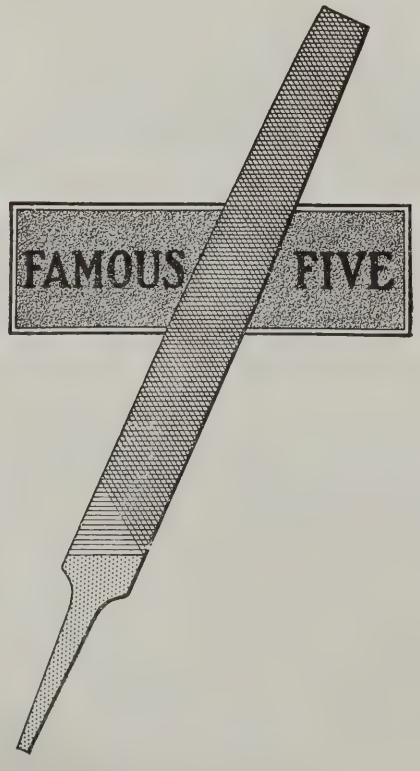
66-1914—*British Standard Specification for Copper Alloy, Three-Piece Unions for Low and Medium Pressure British Standard Screwed Copper Tubes Primarily for domestic and similar work.* 25c. net

Gives composition and tests for material, details as to screw threads, and complete tables of dimensions.

67-1914—*British Standard Specification for Two and Three Plate Ceiling Roses.* 25c. net.

Contains particulars as to construction, material and dimensions for roses up to 250 volts and for currents not exceeding 5 amperes.

68-1914—*British Standard Method of Specifying Resistance of Steel Conductor Rails.* 25c. net.



Recommends method of expressing resistance in microhms, defines the temperature cœfficient, and gives tables of reduction factors.

69-1915—*Report on British Standard Tungsten Filament Glow Lamps (Vacuum Type) for Automobiles.* 25c. net.

Defines form of bulb, position of filement (for head lights only) and formulates standard sizes for bulbs and caps.

71-1917—*Report on British Standard Dimensions of Wheel Rims and Tyre Bands for Solid Rubber Tyres for Automobiles. (Revised September, 1917).* 25c. net.

This report gives standard sizes of wheel rims and corresponding internal dimensions of solid rubber tyres, for sizes of wheel varying from 670 mm. to 881 mm. Metric dimensions are used throughout.

Each "Famous Five" Brand Has a Reputation

Each of the five brands of files listed below has earned separately a reputation for efficiency and reliability.

Each has passed a thousand exacting tests in the hands of practical file users over a period of fifty years.

So we call them the "Famous Five," and are proud of the fully-earned name.

When you buy any one of the Famous Five brands, you get special steel, teeth accurately cut, thorough hardening—in short, standard quality.

The Famous Five Brands are :

Puts Out FIRE Quickly

"It Can't Be Forgotten"

That's the kind of protection you require. Hose systems and extinguishers are all right, but somebody must keep cool and use them. The sprinkler system depends on no one—it is automatic. The water starts when the fire starts.

Manufacturers' Automatic Sprinklers

will actually save you money. Long shutdowns, due to fire, are not covered by insurance, and the sprinklers are the best known arrangement to put the fire out surely and quickly. You can't afford to be without them.

HAMILTON - - ONTARIO

REPORT NO. B.E.S.A. PUBLICATIONS.

72-1917—*British Standard Rules for Electrical Machinery (excluding motors for traction purposes). (Revised September, 1917).* 25c. net.

This important report is intended to define the conditions which characterize British standard electrical machinery, including transformers, but excluding traction motors, and to provide the purchaser and manufacturer with a general specification indicating the information which should be forwarded with an enquiry or an order for an electrical machine. Methods of defining the rating or rated output are formulated, and in this connection are in substantial agreement with the corresponding rules of the American Institute of Electrical Engineers. Enquiries based on these rules will enable the purchaser to compare tenders received from various manufacturers.

73-1919—*British Standard Specification for Five-Ampere, Fifteen-Ampere, and Thirty-Ampere Two-Pin Wall Plugs and Sockets for Domestic Purposes (Without earthing connection). (Revised December, 1919).* 25c. net.

Gives particulars as to construction, standard dimensions, material, and methods of gauging for two-pin plugs and sockets of three sizes (5, 15, and 30 amperes) for pressures not exceeding 250 volts.

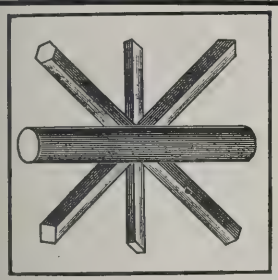
74-1917—*British Standard Specification for Charging Plug and Socket for Vehicles Propelled by Electric Secondary Batteries. (Revised, September, 1917).* 25c. net.

This report contains the provisions necessary to secure interchangeability between any charging plug and any socket of the concentric type. Dimensions of the contact portion of the plug and socket, and dimensions of the gauges needed to check these are given.

75-1916—*British Standard Specifications for Wrought Steels for Automobiles.* 25c. net.

This important report contains definitions of terms used, methods of testing, and specifications for ten grades of carbon, nickel, and nickel chrome steel, each specification giving chemical composition, tensile and brinell tests.

76-1916—*British Standard Nomenclature of Tars, Pitches, Bitumens and Asphalts, when used for Road Purposes, and British Standard Specifications for Tar and Pitch for Road Purposes.* 25c. net.



This valuable report defines tars, pitches, bitumens, and asphalts for road purposes, distinguishing between the tar products and bitumens and asphalts. In this respect the practice of the B.E.S.A. is not in accordance with that usual in the United States, where the term bituminous is applied in a wider sense than in Great Britain.

The specification gives definitions, properties and methods of testing for two qualities of tar, and for pitch suitable for pitch-grouting.

REPORT No. B.E.S.A. PUBLICATIONS.

83-1918—*British Standard of Reference for Aircraft Dope and Protective covering (Including specifications for each ingredient and method of application).* 25c. net.

Provides a standard of reference reproducible in any laboratory, for the purpose of comparing various commercial dopes.

84-1918—*Report on British Standard Fine (B.S.F.) Screw Threads and their Tolerances.* 25c. net.

This report gives revised tables of dimensions for British Standard Fine screw threads and covers theoretical dimensions and standard sizes and tolerances of bolts and nuts for two grades of fit. The report also contains an appendix dealing with methods of determining and compensating for errors in pitch, form of thread, and diameter. Much information is given regarding methods of gauging screw threads.

86-1919—*British Standard Specification for Magnetos for Aircraft Purposes (Superseding for Aircraft purposes Report No. 80-1917).*

Deals with all dimensions (except those of the spring couplings) affecting the interchangeability of magnetos as a whole. Both flange-mounted and base-mounted magnetos are considered.

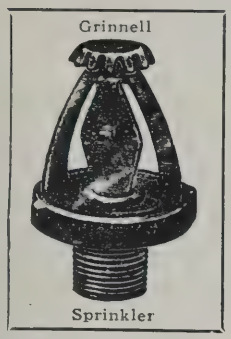
87-1919—*Report on British Standard Dimensions for Airscrew Hubs.* 25c. net.

Gives dimensions affecting the method of securing the airscrew to the hub for engines up to approximately 1000 H.P. and has been drafted with a view to securing international standardization as far as possible.

88-1919—*British Standard Specification for Electric Cut Outs for Low Pressure Type O. For ordinary duty with working currents not exceeding 100 amperes.* 25c. net.

This specification covers dimensions and standard sizes of cut-outs for low pressure and ordinary duty. A separate specification is contemplated for heavy duty cut-outs.

89-1919—*British Standard Specification for Indicating Ammeters, Voltmeters, Wattmeters, Frequency and Power Factor Meters.* 25c. net.



Provides for instruments of three grades, classed as to degree of accuracy. States requirements as to scales, pointers, damping, insulation, marking of connections, limits of error, and other important points.

90-1919—*British Standard Specification for Recording (Graphic) Ammeters, Voltmeters, and Wattmeters.*

Defines chart ruling, adjustments, damping, insulation, marking of connections, limits of error, etc.

95-1919—*British Standard Tables for Use in Engineering Workshops Giving Corrections to Effective-Diameter Required to Compensate Pitch and Angle Errors in Screw Threads of Whitworth Form.* 25c. net.

This important paper gives the necessary information in convenient form for correcting threads of Whitworth form from 28 per inch to 2½ per inch.

Branch Factory at Peterborough

Laundryette Manufacturing Company of Cleveland, Ohio, to Make Machine in Canada

The latest of five United States companies who have established Canadian branch factories at Peterborough, Ontario, during the past nine months, are the Laundryette Manufacturing Company of Cleveland, Ohio. The Laundryette Company have leased a building on Simcoe and Bethune streets with an option to purchase. They will take over this building on November 1st and expect to begin manufacturing operations soon after. A minimum of fifty workmen will be employed.

The products of this company is a patented domestic laundry machine, which both washes and dries clothes. The company have had great success in the United States and some business in Canada. When the machine is made in this country, they look forward to building up a large business.

Edward Parnell, of the Speirs-Parnell, Limited, has been elected president of the Winnipeg Board of Trade, succeeding H. M. Agnew, who has recently resigned.

Recent Trade Enquiries

A List of Enquiries Received from Various Sources including the Canadian Trade Mission, London; the Canadian Trade Commission, Ottawa; the Department of Trade and Commerce, Ottawa; and the Commercial Intelligence Department, C.M.A., Toronto.

DOMESTIC.

493. Agency.—A firm of manufacturers' agents in Winnipeg desire to obtain the agency for the West of a reliable firm manufacturing lines which can be sold to the hardware wholesale trade.
494. Agency.—A representative man in Alberta who handles machinery, wishes to link up with an Eastern manufacturer of mining machinery not yet represented in the West.

FOREIGN.

495. Palestine.—An old-established English firm, with representatives in Shanghai, Singapore, Strait Settlements, and Sydney, desire to get in touch with Canadian firms who wish to extend their business in the Near East, particularly in Palestine. References in London and Cairo.
496. Flour and Cereals.—A delegate to the Imperial Press Conference, who is interested in an Egyptian firm, wishes to secure the agency for Egypt of Canadian flour manufacturers.
497. Belgium.—An old-established firm in Belgium is anxious to make connections with Canadian manufacturers of the folowing goods: Leathers, wire, wire nails, screws, bolts and nuts.
498. New Zealand.—The Secretary of a firm in New Zealand with 36 branches throughout Australia and New Zealand, is visiting Canada, and wishes to secure supplies of the following materials: Paints and varnishes, small hardware, matches, roofing and fertilizers. He also wants to make arrangements for exporting wool, hides, tallow, flax and Kauri gum from Australia. This firm has been established for sixty years and has excellent references.
499. Brazil.—The representative of a very large firm of contractors and merchants in Rio de Janeiro is visiting Canada. This firm has been buying entirely through New York, but wishes to buy materials in Canada. They are specially interested in deals, flooring and paper.
500. Foodstuffs and Hardware.—A South African agency in Cape Town, with branch offices in Johannesburg and Durban, wish to represent Canadian firms exporting hardware and foodstuffs. They have specialized in these two lines. The head of the firm will visit Canada shortly.
501. Confectionery.—A Bolton, Lancashire, firm, ask for offers of chocolate and confectionery.
502. General Foodstuffs.—A Manchester firm are always open to consider offers of hog products, canned meats, fruits, cheese, etc.
503. Paper, Etc.—A Manchester firm are in a position to import all kinds of paper and leatherettes.
504. Wallboards and Wood-pulp Boards.—A London firm wish to purchase considerable supplies of wallboards and wood-pulp boards for shipment to their branches in New Zealand, and invite offers from Canadian manufacturers able to fill orders.
505. Lumber, Plywood, Hardware and Furnishing.—One of the oldest established British manufacturers' agencies in South Africa, with a successful record of 25 years, having their head office at Cape Town and branches at Johannesburg, Durban, and Port Elizabeth, wish to make connections with Canadian firms having lumber, plywood, hardware and furnishing for export. A representative of this firm is expected in Canada this month. This Company are already representing in South Africa one very important Canadian manufacturing company.
506. Waterproof 3-ply Wood.—A London firm inquire for the names of Canadian manufacturers of waterproof 3-ply wood, suitable for aircraft construction.
507. Maple Last Blocks.—A Midlands Company are prepared to buy maple last blocks in the rough.
508. Mangle Roller Blocks.—A woodturner in Kent wants to buy supplies of mangle roller blocks.
509. Orange Boxes.—A Cape Town firm of importers are inquiring for 100,000 orange boxes, delivery Cape Town, March, 1920. Full particulars as to sizes on file with the Commercial Intelligence Branch, Department of Trade and Commerce, quoting this inquiry. The specification of the box required is as follows: 8 pieces, tops, bottoms and sides, 26 inches by 5½ inches by ¼ inch; 3 pieces, middles and ends, 11½ inches by 11½ inches by 11-16 inch; cleats, 11 inches by ¾ inch by ⅜ inch. The tops, bottoms and sides to have rounded edges if possible. There is no objection to built up ends and middles, providing that these are well joined and well packed. White wood is required, thoroughly well seasoned.
510. Clothes Pins.—A Hull, England, firm, are interested in receiving offers of the above.
511. Furniture.—A Manchester firm are prepared to consider offers of all kinds of furniture; would also act as representatives for manufacturers of wood parquetry.
512. Office Furniture.—A house in Milan would be very glad to buy office furniture in Canada.
513. Furniture.—A Manchester firm are open to consider offers of chairs, roll top desks, and bedroom furniture.

514. Office Furniture.—A Milanese firm would act as representatives for Canadian firms manufacturing office furniture.
515. Leather—A Northampton firm are always in the market for all kinds of good class upper leather, such as box calf, box veals, box sides and glace kid, patent sides, etc.
516. Chemical Products.—A house in Naples are desirous of getting in touch with Canadian firms wishing to do business in Italy in the foregoing.
517. Chemicals.—A Manchester firm are prepared to consider offers of any chemicals, dyestuffs, or tanning materials; would also act as agents for manufacturers of chlorate of soda and potash.
518. Industrial Alcohol.—A London Company ask for the addresses of Canadian producers of industrial alcohol for methylating purposes, 67 per cent. overproof in iron drums.
519. Hollow-ware, Tinware, Domestic Specialties, and Labor-Saving Appliances.—Glasgow correspondent states that there is great demand in that area for hollow-ware, tinware, cast hollow-ware, household spring balances, and Sad irons, and wishes to be placed in touch with any Canadian firms wishing to be represented in these lines. The demand for all domestic labor-saving appliances is very strong, and he would like to be placed in touch with all Canadian manufacturers who would consider export orders.
520. Motor Body and Metal Fittings.—Established British firm wish immediate connections with Canadian suppliers of motor body fittings, such as door handles, wind screens, window fitments and locks, all of reliable make and latest pattern. Also seek sources of supply of metal parts of office furniture, such as desks and filing cabinets.
521. Hardware, Glassware, and China.—A London firm who claim a first-class connection among wholesalers and export houses, are desirous of securing the agency or selling rights of the United Kingdom, of Canadian manufacturers of hardware, such as nails, screws, hinges, bolts, nuts; garden, farm and shop tools, and mincing machines; and also glassware and china.
522. Food Choppers.—There is a market in Scotland for domestic sale of Canadian food choppers, and Scottish importer would like to get in touch with Canadian manufacturers.
523. Foundry Plant and Tools.—A Manchester firm are open to purchase foundry plant and furnishings, also engineers' tools, or would act as representatives of manufacturers of same.
524. Tools, Machines, Etc.—A Bradford, England, firm are interested in importation of tools, machines, etc., and all commodities used in the foundry and engineering trades.
525. Leathers, Nails and Wire.—Established Belgian importer wishes to be placed in touch with Canadian manufacturers of upper leather for shoes, shoe nails, wire nails, and wire of every description. Has important connection for distribution of the same, and will furnish British references.
526. Essential Oils, Essences, Dyes, Etc.—A firm in Milan would buy on its own account the foregoing articles or act as representative for Canadian firms.

Deaths Among Prominent Manufacturers

John E. Boswell

Formerly of the Thornton Rubber Company, Dies While Playing Golf at Oshawa

While playing golf on the Oshawa links, in the afternoon of August 18th, John E. Boswell of Toronto and Whitby had a stroke, and died shortly afterwards at the Oshawa General Hospital. Mr. Boswell was born in Cobourg sixty-one years ago. For some years he was connected with the Thornton Rubber Company of Oshawa, and he was also a member of the firm of Morrison & Boswell of Toronto. About two years ago he retired and moved to Whitby, Ontario. He is survived by his wife and two sons. A third son was killed at the battle of Langemark.

Joseph R. Clarkson

Former Managing Director of the Partington Pulp and Paper Company Dies in Scotland

The death of Joseph R. Clarkson took place recently in Helensburg, Scotland, where he had lived in retirement for a number of years. He was for a long time managing director of the Partington Pulp and Paper Co. of St. John, N.B., (now the Nashwaak Pulp and Paper Co.) and leaves a wife and two sons, one of whom is J. B. Clarkson, who is on the staff of the Fraser Companies, Limited, Edmundston, N.B.

ELDER DEMPSTER LINES

Canada-South Africa Direct Service

Regular monthly sailings from Montreal in Summer and St. John, N.B., in Winter, calling at Cape Town, Algoa Bay (Port Elizabeth), East London, Port Natal (Durban) and Delagoa Bay in the order named.

Canada-West Africa Direct Service

From Montreal in Summer, and from St. John, N.B., in Winter, monthly sailings for Dakar, Sierra Leone, Seccondee, Accra and Lagos, and other ports on the coast, if sufficient inducement offers.

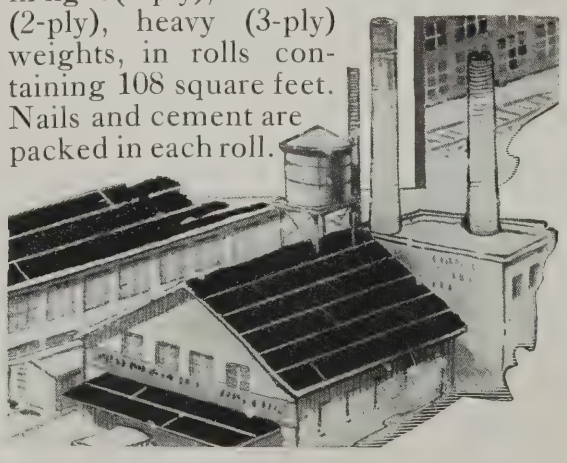
Barrett Roofings, Cements Industrial Paints etc.



BARRETT PRODUCTS are noted everywhere for their high quality. For many years they have been giving perfect satisfaction to thousands of users. Barrett Products are absolutely dependable—they are *always* good.

Everlastic "Rubber" Roofing

Everlastic "Rubber" Roofing is a strong, pliable fabric made by thoroughly saturating the best grade of roofing-felt with a high-grade water-proofing composition. It is then heavily coated on both sides so that it will resist not only the elements which attack a roof from its *upper* side, but will also prevent deterioration from steam, vapors, and gases that often reach the *under* side.

The hottest sun will not cause it to run. Zero cold will not shrink or crack it. It gives satisfaction under the most extreme climatic changes. Millions of squares of this roofing are in use.

Everlastic "Rubber" Roofing comes in light (1-ply), medium (2-ply), heavy (3-ply) weights, in rolls containing 108 square feet. Nails and cement are packed in each roll.

Everlastic Liquid Roofing Cement

Unequalled for re-surfacing worn-out felt and "Rubber" roofs. Has the consistency of thick molasses; is easy to apply and dries quickly into a hard, elastic, wonderfully durable coat. Proof against moisture, acids, alkalies and fumes. Has same base as Barrett Specification Pitch, which is famous for its waterproofing qualities.

Comes ready for use in packages ranging from 1 pint tins to 40 gallon barrels.

Elastigum Plastic Patching Cement

For patching holes and leaks in all kinds of roofs, repairing flashings, relining gutters, etc. Known as the "Plastic Cement of a Thousand Uses."

Elastigum is tough, elastic, plastic, water-proof, acid-proof and alkali-proof. Requires no heating or mixing. Very inexpensive. Put up in 1, 5, 25 and 100 pound packages; ½ barrels and barrels.

If your dealer cannot supply you with Barrett Products write us and we will. Descriptive booklets regarding these products sent free on request. Address nearest office.

Editorial Comment

Precautions Against Dumping

WITH the reported slowing down of production in the United States there will be a temptation on the part of some American manufacturers to use this country as a dumping ground for their surplus stocks, and already there are evidences that this is being done. There is machinery provided for preventing the demoralization of our market by a flood of cheap imported goods, and this can be effected through the application of the dumping clause. Undoubtedly attempts will be made to evade this regulation, and the utmost vigilance is needed to prevent any widespread violation of its provisions.

Not only does the dumping of goods serve to demoralize the domestic market, but when goods are so imported the Government does not receive the revenue it is entitled to. From both standpoints it is desirable that all possible steps should be taken to see that goods coming into the country are not valued at less than their fair market price in the United States, or if imported at such lower valuation, are subjected to the special dumping duty provided in such cases. The next few months may prove to be trying ones in this regard, and a watchful eye should be kept on the situation.

The Shortage of Industrial Alcohol

A SOMEWHAT disquieting statement with regard to the shortage of industrial alcohol has been issued by the Advisory Council for Scientific and Industrial Research. It indicates an impending world-wide shortage in the supply of this important material and gives an explanation of the causes which are at work to produce this result, in Europe the scarcity of the raw material from which alcohol is made and in the United States and Canada through the operation to a large extent of prohibition laws.

The production in Canada of industrial alcohol is at present about five million proof gallons, or about two and a half million gallons of 95 per cent. strength. The capacity of the distilleries in operation is about eight million proof gallons, while the distilleries now idle have a capacity, it is said, of about eight million proof gallons. If, therefore, the distilleries now operating were producing to capacity and those not at present operating were again under production, a very considerable improvement in the supply would result. Otherwise, there is every reason to fear that the cost of industrial alcohol will continue to soar.

It is to be hoped that some of the distilleries in Canada will restart and do their bit to relieve the shortage. Those who have made a study of the situation feel confident that there will be handsome returns to the industry for several years to come at least.

The Safety Movement in Industry

SPEAKING before the Ontario Division last month, Mr. R. M. Little, of New York, who is one of the foremost apostles of the safety movement in industry in the United States, made a significant statement. He remarked that it was not until the educational idea was introduced that the movement began to show really satisfactory results. Much money had been spent in safety appliances and mechanical devices to protect the lives of workmen but, while these had reduced the number of serious accidents, there had been no decrease in the frequency of accidents.

To-day the safety movement is a much bigger and broader undertaking than the mere mechanical protection of dangerous machines. It incorporates an appeal to the intelligence of the workingman and the humanity and business sense of the employer, and manifests itself in a thousand and one avenues of effort and emulation. Important results have been achieved, particularly through the introduction of the spirit of competition, which makes the workers in any given plant eager to improve on their

record from year to year and to surpass the records established by other plants.

Emphasis was laid by Mr. Little on the economic benefits to be derived from the introduction of the safety movement in industrial plants. It was, in his opinion, the one subject on which management and men could get together in absolute harmony, and in safety councils he saw promise of better things in industrial relations. In effect his idea was that by making a start with "safety first," it would be possible to evolve a system by which the men who were working together in the great humanitarian cause of safety would extend their field of vision to include other matters vital to the welfare of the industry and on which differences of opinion might exist. In this way the safety council would, indeed, prove to be a real safety valve when trouble threatened in the plant.

Depreciated Value of Foreign Currency

THE Customs Department has issued a memorandum which states that the governing value of imported goods for duty purposes is the fair market value for home consumption in the principal markets of the country, whence and at the time when the goods are shipped to Canada, in terms of the standard currencies of such countries of export, regardless of whether transactions in specie take place or not.

The regulations state that where payments of specie have been suspended and the business of the country of export is carried on on a paper currency, the home market value of the goods exported may be shown in terms of the paper currency, provided the value of the paper currency in relation to the standard coins is also shown.

Where this relative value is shown, the Customs collects duty on the gold value of the goods imported, gold being the standard coin of the currency of most European countries, and, in effect, this means that the depreciation in foreign currency is recognized for duty purposes.

This interpretation of the Customs Act will prove of decided advantage to importers of goods from such European countries as France and Germany, where the rate of exchange is far below par. There is, however, a possibility of this advantage being abused. Unless the Customs Department sees to it that imported goods are appraised at their true market value as sold for home consumption in the country of export, it is possible that unscrupulous exporters, and exporters seeking to gain control of the Canadian markets, will take advantage of this interpretation of the act to invoice goods shipped to Canada at prices very much less than the goods can be manufactured for in this country. In this way a manifest injustice will be done to Canadian manufacturers, and in particular those who have endeavored to produce those commodities which, before the war, were largely imported from European countries.

For example, a German firm who, prior to the war, sold pencils in Canada at a price of 26 marks per gross—equivalent to $6.18 in Canadian currency—have recently offered these pencils at the same price of 26 marks per gross. A shipment of 100 gross of these pencils would show a value of 2,600 marks, but if the exporter certifies that the price is in terms of paper currency, and that at the date of shipment 2,600 paper marks are the equivalent of 175 gold marks, which is about the relative value of paper marks and gold marks at the present rate of exchange, these goods would, under the present ruling of the Customs Department, have a dutiable value of something like $39, whereas the fair market value in the country of export would really be over $600.

As was pointed out previously in these columns, in none of the European countries has there been appreciation in costs corresponding to the depreciated value of their currency in relation to the Canadian dollar. This being the case, any appraising of imported goods merely on the prevailing exchange rate would not take into account the fair market value, and thus would be contrary to the Customs law. It, therefore, devolves on the Customs Department to make such valuation as will give the imported goods a value in harmony with the cost of similar goods as sold for home consumption in the country of export.

The Power Situation in Ontario

PRESENT indications point to another winter of uncertainty with regard to the supply of Hydro-Electric power in the Niagara power zone. Unless the winter should prove to be an open one, with ice troubles at a minimum, there is every prospect that the irregular service of last winter will be repeated to a greater or less extent. Nothing, apparently, can be done to prevent the ice floes in the upper river from interrupting the supply of water going to the turbines and either stopping them or reducing their efficiency.

Apart from the danger of interruption, it must also be remembered that there is little or no margin between the quantity of power generated and the requirements of consumers. In fact it is matter of common knowledge that a serious shortage exists, and every scrap of power produced is needed. This being the case, it behoves power users to practise all possible economies, particularly during those morning and evening hours when the peak load is heaviest.

As large consumers of power, the manufacturers using Niagara power are being urged to take steps to conserve the supply during the difficult period lying ahead. This can be done in various ways. Night operations, in order

to relieve the day load; the closing down of the plant an hour earlier; the shutting off of all machines not absolutely required; the utilizing of the most effective types of lights and motors—all these are calculated to help, and just a little saving here and there, if spread over a large area, will mean a great deal.

A Call for British Capital

DURING the tour through Canada of the Imperial Press Conference delegates, it was again and again emphasized that the Dominion was anxious to see more British capital coming into the country. British immigrants and British money were mentioned as being two of our greatest needs, and many speakers referred to the great desirability of attracting both to our shores.

The delegates saw for themselves that at present it was largely United States capital that was developing the resources of Canada. This was brought home to them forcibly in connection with the pulp and paper industry. Coming here with the idea that Canada should be supplying more paper to the various parts of the Empire by reason of imperial affiliation and friendship, the overseas publishers soon discovered a very good reason why the quantity of paper available was so limited. It was not that there was wanting a willingness to sell to them, but the United States had the first call, and there was no controverting the argument that, if the Americans saw fit to invest their money in Canadian paper mills, they were entitled to reap the benefit.

British publishers were told quite frankly that if they proposed to derive a paper supply from Canada, they must induce British capital to come over and build mills. Through this means alone would relief be obtained from the present stringency. If this course is pursued and active steps are taken to persuade British capitalists to invest in Canada, the movement should spread to other lines besides paper. There are abundant opportunities in Canada for the British manufacturer, and the delegates to the Imperial Press Conference will be doing well to point them out. This should be at least one important result accruing from their visit to Canada.

That Extra 25,000 h.p.

IT is somewhat perplexing to business men, not versed in the intricacies of the law, to know why the extra 25,000 h.p. of electric energy, which the Toronto Power Co. are equipped to develop at Niagara Falls, is not available for use, particularly when power is so badly needed. The addition of this extra 25,000 h.p. to the present supply might make all the difference between feast and famine.

As explained to the Ontario Division of the Canadian Manufacturers Association by Mr. P. W. Ellis, chairman of the Queen Victoria Niagara Falls Park Commission, which body grants the franchises for power development on the Canadian side of the Niagara River, the Toronto Power Co. have the right to generate up to a limit of 125,000 h.p. The Toronto Power Co., originally the Electrical Development Co., installed 150,000 h.p. of generating capacity and claimed the right to develop to the full 150,000 h.p. on peak so long as their average load was maintained at 125,000 h.p. The Parks Commission would not allow this claim, and it was opposed in the courts, the position of the Commission being maintained in a judgment issued by Mr. Justice Middleton on February 28, 1919.

During the war and acting under the Power Controller's orders, the Toronto Power Co. had been permitted to generate 25,000 h.p. above their franchise rights, the same being supplied to Hydro consumers engaged on munitions and war supplies. This power was withdrawn at the cessation of hostilities. A Royal Commission of three judges was then appointed by the Ontario Government to determine the Company's position. After careful consideration this Commission confirmed the limit of the Company's franchise rights to 125,000 h.p., but ordered them to generate the extra 25,000 h.p. and supply it to the Hydro. This decision was disputed by the Company on legal and physical grounds, and in the meantime the power is not being generated.

It is to be hoped that some action will be taken immediately to bring into use this readily available power. Relief from the Chippewa-Queenston system is still a long way off, and it seems absurd that power users cannot have the advantage of this immediate supply.

Co-operate for Efficiency.

THE C.M.A., following the objects set forth in their constitution, have a wide field to cover, and a great deal of work is involved in the successful prosecution of their aims. Much of this work is distributed among the paid officials of the Association, but a certain amount must necessarily fall on the members themselves. As the work to be done is of a specialized or general nature, so meetings of committees, branches, divisions or of the whole Association are held from time to time. Arranging for such meetings is the secretary's task.

When a meeting is to be held or a luncheon to be given, the secretary must find out how many can attend. So notices are sent out with post cards enclosed for replies. Some members reply at once; others delay till the last minute; others do not reply but attend the meeting; still others neither reply nor attend. The result is that nothing short of clairvoyance will tell the secretary what accommodation to provide. When the meeting occurs there will almost certainly be complaints about needless waste or lack

of accommodation, according to the alternative adopted. The complaints are justifiable, but too often the blame is wrongly placed.

The remedy is obvious. When notice or questionnaire requiring a reply is sent to you, answer without delay. If you have information about your business that can be used in INDUSTRIAL CANADA, let us have it when we ask for it, or send it in without waiting to be asked. No one instals a valuable machine in his factory and allows it to be ruined for want of lubrication. Think of the C.M.A. as a part of your equipment; co-operation is the oil needed if you are to get maximum efficiency.

The Advance in Freight Rates

NO argument that could be advanced against a wholesale increase in freight rates carries more weight than that which demonstrates how serious may be the result in interrupting inter-provincial trade if rates are raised to such a pitch that traffic will be diverted north and south. Canada's trade policy has always been to encourage the east and west movement of freight, and our railways have nearly all been built with that object in view. To push freight rates beyond reasonable limits will not only act as an obstacle to this national trade policy, but will react to the disadvantage of the railways themselves.

It may readily be demonstrated that under the new scale of rates provided in the recent order of the Board of Railway Commissioners, a handicap is placed on the movement of freight between Eastern and Western Canada as compared with the movement from points in the Central and Western States to Western Canada. Take, for example, fifth class rates from St. Louis, Terre Haute and St. Paul to Winnipeg, and contrast them with the corresponding rates from Toronto to Winnipeg. Under the old rates the rate from St. Louis to Winnipeg was 19 cents less than from Toronto to Winnipeg; under the new rates 27½ cents less, an increase in the spread of 8½ cents. From Terre Haute to Winnipeg the rate was 5 cents less, but is now 9½ cents less. From St. Paul to Winnipeg it was 45½ cents less, but is now 63½ cents less. As approximately 50 per cent. of the carload ratings in the Canadian freight classification are fifth class and cover a great range of commodities, the seriousness of these increases must be apparent.

In view of the necessities of the railway companies it is doubtless impossible to escape increased rates, but we are strongly of the opinion that increases should be confined as far as possible to local areas and special consideration given to long haul rates between east and west and vice versa. It is known that through the encouragement given by the railway companies to manufacturers in the Maritime Provinces, important business connections have been established between the latter and the merchants of Ontario and Western Canada. Is it too much to ask that these connections should not now be jeopardized by the establishment of rates that will divert orders to American manufacturers?

The case of the Maritime Provinces manufacturers does not appear to have been fairly dealt with. Notwithstanding the strong representations made before the board by E. M. Macdonald, K.C., on behalf of the Maritime Division of the Canadian Manufacturers Association, these representations were disposed of in the following brief manner by the Chief Commissioner,—"Mr. E. M. Macdonald, K.C., on behalf of the Maritime section of the Canadian Manufacturers Association and Honourable Mr. Finn on behalf of the Government of Nova Scotia, urged that in any advance which might be made, the proportional arbitraries east of Montreal in existence prior to the year 1915 should be maintained. I fear, however, we have not sufficient information at the present time to justify us in attempting to deal with this question, therefore, in arriving at my decision, I have not taken this into consideration, but always reserving the right of the Maritime people to apply to the Board, and also reserving the right to render a decision on the sugar application, now before us, regardless of what the general decision may be hereunder."

The chairman has invited a special hearing. It seems only proper under the circumstances, and in view of Mr. Macdonald's representations, that the Board should hold sittings in the Maritime Provinces in order to give an opportunity for the further presentation of the case.

With regard to western rates, the judgment of the Board states that rates generally are from 15 to 18 per cent. higher than in the east. No evidence was given in support of this, nor was it placed before the Commission in the application. The only way to determine whether or not rates are higher in the west than in the east is to analyze the traffic. This is a vital question and, if discrimination does actually exist, it should be removed. We hope that the Board of Railway Commissioners will make a thorough investigation and, if the facts are as stated by the representatives of the Western Boards of Trade, order the removal of the difference.

Attitude of the Press

AN examination of the editorial pages of Canadian daily newspapers, during the early stages of the tariff inquiry, naturally disclosed a considerable difference of opinion among editors as to the merits of the arguments presented by the Canadian Manufacturers Association and the Canadian Council of Agriculture. On the whole, however, it is quite safe to say that the press of Canada, by a substantial majority, has endorsed the contention of the manufacturers that nothing should be done in the way of tariff-tinkering to injure the interests of the manufacturing industries of the country.

The only out-and-out hostility to the Canadian Manufacturers Association's views appears to have been shown by a number of the daily newspapers of Saskatchewan and, of course, by a certain section of the farm press. In both cases this hostility was to be expected. The old arguments that the country should not be called upon to support industries not indigenous to the soil; that a reduction in the tariff would not necessarily mean a reduction in Customs' revenue; and that many industries were now in a position to prosper without protection, were trotted out with others of the same kind, but no successful attempt was made to answer the big arguments of the manufacturers that any radical reduction in the tariff would destroy Canadian industry and greatly curtail the domestic market for farm produce.

A number of other newspapers, while not openly friendly to the manufacturers' cause, took pains in their editorial utterances to avoid any advocacy of free trade. Their most frequent line of talk was to plead for conciliation and co-operation, and to argue for a tariff sufficiently high to preserve and encourage our industries and yet not high enough to foster combines. These were, in the main, papers opposed to the present Government and supporters of the Liberal Opposition.

Apart from these two classes, the openly hostile and what might be called the middle-course press, newspapers generally threw their support to the tariff views enunciated in the manufacturers' statement. From all parts of the country, even from the great grain-growing province of Saskatchewan itself, came the cry that Canadian industry must be preserved and that nothing should be permitted to interfere with its forward progress.

The Tariff Inquiry

IT would, indeed, be premature to offer any opinion at this early juncture as to the probable outcome of the tariff inquiry. The committee of the Cabinet charged with the task of taking evidence has still a great deal of ground to cover, including the industrial districts of the East and, so far as the manufacturing interests of the country are concerned, only the surface has been scratched as yet.

It is being contended in some quarters, particularly by that section of the newspaper press opposed to the present administration, that the result of the inquiry is already a foregone conclusion. Papers like the St. John *Telegraph* and the Edmonton *Bulletin* voice this opinion. The latter declares that, "It has been decided that the country is to have a protective policy during the lifetime of the present Government, willy-nilly," while the former says, "The Meighen Cabinet will finally decide the nature of tariff revision to be carried out, and so the work of the so-called Tariff Commission of Inquiry is limited at the outset by the view of Hon. Mr. Meighen and his Conservative associates, who dominate the administration."

Contrasted with these somewhat cynical views of the *bona fides* of the Commission, is the comment of the *Grain Growers' Guide,* the official mouthpiece of the organized farmers. The *Guide* at least admits that there is a desire on the part of the Commission to get all possible information. "The attitude of Sir Henry Drayton toward those appearing before the Commission is all that could be desired," it states. "It was evident that he is sincerely desirous of gaining adequate information bearing upon every phase of the tariff question, and his courteous and patient manner is an encouragement to those who might feel some diffidence in laying before him either an experienced or a reasoned statement relating to the tariff. It is especially desired that the farmers of the Prairie Provinces will make it their business to appear before the Commission and state just how the tariff presses upon them."

The texts of the arguments both for and against an adequate protective tariff are to be found in the briefs presented to the Commission at the outset of the proceedings by the Canadian Manufacturers Association and the Canadian Council of Agriculture. Both are very thorough and painstaking presentations of the case from the opposing viewpoints. The manufacturers have rested their main argument on the injury which would be wrought to Canada were our industries to be exposed to the competition of the larger industries of the United States, an injury that would be reflected in lessened home markets for agricultural products and a general slowing down of the progress of the country. The farmers argue on their part that the tariff has hindered agricultural development, that many industries are now in a position to stand on their own feet and that, by a more thorough system of collecting the income tax, the loss of Customs revenue through a reduction in the tariff could be made up.

The evidence submitted by the manufacturers of the West who have so far appeared before the Commission, has all gone to support the position taken in the brief. The extent of the interests involved in capital, labor and production has been emphasized. The fact that the industries were started as a direct result of protection has been stressed, and the belief that any serious cut in the tariff would be the means of driving them out of business has been everywhere advanced. The Commission must have been impressed with the rapid growth of manufacturing industry in the West, and could not have failed to recognize the importance of the interests involved.

Examination of witnesses by Sir Henry Drayton and Hon. Mr. Robertson has indicated a desire on the part of the Commissioners to arrive at some idea of the methods adopted by manufacturers in determining the selling price of their goods—whether based on the American price or on their own cost price. Careful questions were also asked about the source of supply of raw materials, the extent to which imported raw materials were used and the portion of the cost of the finished product represented

by the duty on such goods. It is evidently the intention of the Commission to secure a lot of information along these lines, and it would be desirable for manufacturers generally, who may propose to give evidence, to post themselves thoroughly on these and similar points.

The Get-Together Spirit in Evidence.

THAT the leaders of the Canadian Manufacturers Association are neither hostile nor averse to the establishment of most friendly relations with all other classes in the community was evidenced at the last Canadian National Exhibition in Toronto, when the president of the Association, Mr. J. S. McKinnon, was a fellow-guest with the head of the farmer-labor government of Ontario, Hon. Mr. Drury, at a directors' luncheon and exchanged overtures of friendliness with him. To quote the *Toronto Globe*, which dealt editorially with the event:—

"May it not be regarded justifiably as an event of some significance when the President of the Canadian Manufacturers Association, the Minister of Trade and Commerce and the head of a Provincial Farmer-Labor Government jointly are guests of honor at a function to discuss Canada's industrial programme and future? Particularly when manifestly it is the purpose of all to relegate platitudes and generalities to places where they may be more appreciated, and, for the time being, as Sir George Foster expressed it, 'to be frank and do away with camouflage'? There were differences, of course. It scarcely could be otherwise. But when representative men earnestly aim at understanding and co-operation they are more than likely to achieve it. Mr. McKinnon voiced the common slogan: 'Let us all join together for the good of Canada.'

"The President of the Manufacturers and the Farmer Premier each deplored the chasm which seems to exist between manufacturer and agriculturist. The former suggested a meeting together—a conference as fellow-Canadians. The latter responded by recognition that 'we ought to be first and foremost Canadians.' The only way in which to win mutual confidence, he believed, was 'by-putting all the cards on the table.' Mr. Drury added the assurance: 'You will find the other side to the controversy as reasonable as you are. Don't consider the agriculturist an unreasonable man.'

"The spirit displayed in the words of these representative men was the right spirit. There was never greater need for national unity. All men cannot be expected to see eye to eye. There will be differences and disagreements. But if all sides to every national issue conduct their campaign on the lines and in the spirit of the men who met and talked at the Canadian National Exhibition the other day there need be no fear for the future."

Establishing Friendly Relations

The President of the Canadian Manufacturers Association, Mr. J. S. McKinnon, is here shown in company with Sir George Foster, Minister of Trade and Commerce; Hon. E. C. Drury, head of the Farmer-Labor Government of Ontario; and Hon. Manning Doherty, Ontario Minister of Agriculture, the occasion being a luncheon at the Canadian National Exhibition, at which Messrs. McKinnon and Drury were the principal speakers.

Preferential Tariffs Endorsed

AMONG the many resolutions passed by the delegates to the recent Congress of the Chambers of Commerce of the Empire in Toronto, none was more significant than that endorsing a policy of preferential trade throughout the Empire. It is true that there was a sharp division of opinion on the subject, and in the end a vote had to be taken, but the resolution carried by a substantial majority.

Two Canadian manufacturers, Messrs. W. F. Cockshutt, M.P., and Lloyd Harris, were vigorous supporters of the preferential idea and delivered strong speeches in its favor. They had the backing of delegates from several of the overseas dominions and from a section of the delegates from Great Britain. Opposition came largely from those British delegates who are still advocates of the policy of free trade.

Closely allied to the subject of inter-Empire trade was that of exchange. This matter was introduced to the Congress by Mr. John F. Darling, of the board of directors of the London Joint City and Midland Bank, who outlined a system by means of which he thought exchange within the Empire could be stabilized. In short it contemplated an extension of the Bank of England's operations to the overseas dominions. Its notes would become in effect Imperial notes, which could be issued against self-liquidating bills of exchange. The pound sterling would be the unit of value throughout the Empire, except in Canada and India.

Synopsis of Proceedings Before the Tariff Commission in Western Canada

BASED ON THE OFFICIAL REPORT

ON September 14 the special committee of the Dominion Cabinet appointed by the Government to hear representations in regard to the Canadian customs tariff held its first hearing in Winnipeg, the members present being Sir Henry Drayton, Minister of Finance, chairman, and Hon. G. D. Robertson, Minister of Labor. Since then the Commission has visited the Pacific Coast, and is now on its way to the East. Such vital importance attaches to the work of this Committee that no excuse is offered for publishing in these columns a careful résumé of the evidence submitted by the various witnesses who have already appeared before it. It will be noted that, so far, the manufacturing interests of Canada have been well to the fore in acquainting the Commission with the position of the manufacturing industries of the country on the important issue in hand.

WINNIPEG

September 14.—The first session of the Tarriff Inquiry opened at the City Hall. Sir Henry Drayton, chairman of the Tariff Commission, outlined the purpose for which the Commission was created. "The whole object of the meetings," said he, "is to obtain just as much information as possible as to how the country's fiscal policy is affecting the people of Canada, her industries and her production; to ascertain what changes in the tariff or other fiscal measures ought, in the public interest, to be made and what alternative and additional source of revenue can be adopted."

Three underlying principles were enunciated by Sir Henry. "(1) That Canada must pay her way and discharge her current obligations out of her current revenue. (2) That policies conceived to bring about conditions assuring maximum opportunity of profitable labor in all spheres of human activity that can be properly and profitably carried on in the country should be adopted. (3) That in carrying out these principles our fiscal policies, while ensuring the necessary revenue, should be applied in a manner least burdensome to the public."

Sir Henry, in conclusion, referred to the necessity of keeping before them the dollar cost of their preserved and continued freedom. War expenditure for the current fiscal year totalled $296,000,000. Estimates for the current year called for $314,000,000 for objects apart from the war. It was obvious that a large revenue must be obtained.

The statement of the Canadian Manufacturers Association (see September issue, page 73) was read in its entirety by J. S. McKinnon, president of the Association.

Farmers' Statement

The statement of the Canadian Council of Agriculture was read by Norman P. Lambert, secretary of the Council. It dealt briefly with the organization and objects of the Canadian Council of Agriculture and the origin and purpose of the farmers' platform of 1916. Stating that Canada will be for years a pioneer's country; that Canada's richest natural resource is agricultural land and that the so-called national policy has failed to make the most of the true natural resources of the country, it continued,—"The bedrock upon which the farmers' platform would lay a new national policy for Canada, is upon a low customs tariff and upon direct methods of taxation. It does not ask for drastic legislation which would tend to unsettle and injure Canadian industry but it does take the position that a national policy, based upon the principle of protection, is wrong. It suggests that the fiscal policy of Canada's future governments should aim at redeeming the customs tariff to a strictly revenue basis. Production and trade in Canada have been forced into narrow, unnatural and uneconomic channels through the application of protective duties, and thereby development of vast supplies of natural wealth has been retarded and the Dominion prevented from proceeding favorably towards a realization of the fruitful destiny which nature has intended for her."

It was contended that the tariff was "the most wasteful and costly method ever designed for raising national revenue." Its alleged injustice was also mentioned. Special attention was devoted to the textile industry and to the agricultural implement industry. Of the former it was claimed that "if there was one industry more than another in Canada which ought to be made to stand on its own feet, it is the textile industry;" of the latter that "the farm implement industry of Canada has no claim whatever to protection, either upon the basis of being an infant industry or upon the necessity of preserving for itself the home market."

On the other hand, the statement argued that the agricultural industry should be encouraged so that an increasing volume of exports might be maintained in order to assist in liquidating national indebtedness. "The agricultural industry of Canada to-day is responsible for maintaining year in and year out the vast bulk of the exports which are shown in their country's record of trade and commerce. It is most essential that their record should not only be maintained but increased if possible." A conference on taxation for the purpose of dividing fields of taxation among the Dominion and provincial governments was advocated. It was contended that the income tax, if thoroughly and forcefully applied, ought to yield a revenue of at least 200 million dollars per annum at this time.

Massey-Harris' Statement

Thomas Findley, president and general manager of the Massey-Harris Co., Toronto, presented a statement in support of the position of the manufacturers of agricultural implements. After tracing the history of the industry in Canada, Mr. Findley proceeded to refute three charges frequently made against it. The first was that Canadian implement companies sold their goods abroad at lower prices than at home. "My company," declared Mr. Findley, "has exported machines to practically every grain-growing country in the world for well over thirty years, and we have never during that time sold machines in foreign countries at as low prices as at home." A series of figures were given to demonstrate the truth of this statement.

The second charge dealt with was that prices of implements are more favorable in the United States than in Canada. To this, Mr. Findley replied by showing that the basis of comparison was unfair; that a proper comparison must be based on retail prices and, that if this is done, the average difference in prices between say Manitoba and Minnesota would not be equal to the average difference in the freight rate.

Question of Drawbacks

The third charge was that foreign and domestic drawbacks constituted bonuses to Canadian implement firms. With regard to the former, Mr. Findley made it quite clear that "the drawback is not a bounty but simply a refund of part of the duty on the materials in order to put the Canadian manufacturer on a competitive basis abroad with the United States manufacturer." So far as domestic drawbacks are concerned, it was their policy to give the advantage of these drawbacks to their customers.

Mr. Findley next dwelt with the history of the customs tariff on implements, showing how the duty had been reduced. His conclusion was that local competition was a much more important factor in establishing low prices than the customs tariff. He further showed that "while our farmers are trying to drive implement makers out of Canada, the farmers of every country where there are no local manufacturers are anxious to have them."

That the cost of the tariff to the grain-grower had been greatly exaggerated was the next point made by Mr. Findley. A calculation was made to show that, assuming there were an extra cost, it would only amount to one cent a bushel. This could hardly be claimed to have any influence on the progress of agriculture in Canada.

Attitude on Tariff

In conclusion, Mr. Findley showed that so far as the Massey-Harris Co. were concerned, they would be quite prepared to have the tariff taken off their implements, if at the same time it was taken off everything that entered into the cost of producing them. However, realizing that such a step would work a hardship on other implement companies, they were opposed to it. Further, they believed that the maintenance of the tariff would encourage American firms to establish plants in Canada. "If the tariff on implements had been more stable we should have had many more such branch factories erected in Canada during the past twelve or fifteen years. The factories which will supply implements for the needs of Western Canada ten or fifteen years hence have yet to be built, and the tariff policy on implements will determine whether such factories will be built in Canada or in the Middle Western States."

Questioned by Sir Henry Drayton, Mr. Findley stated that about two-thirds of their raw materials came from the United States, steel from Pittsburg, pig-iron from Buffalo, Tonawanda and various other points, and lumber from the Southern States. Steel represented about 35 per cent. of the cost of manufacture and lumber about 20 per cent.

With regard to the allegation that Canadian manufacturers have no cost price of their own, but simply take the American price, add duty and freight rates and then make a sufficient cut, Mr. Findley replied that his company paid absolutely no regard to the American price. "We fix our price on cost, plus what we consider will cover expenses and a profit. I think the absolute proof of that is that, if you follow all the tariff revisions, you will find no change in price in any case, except where the materials were reduced by such methods as I have referred to, such as drawbacks. In other words, the fact that the duty was taken off the implements did not enable us to make the price any lower and we never did."

Industry in the West

D. J. Dyson, Dyson Vinegar Co., Winnipeg, chairman Prairie Division, C.M.A., followed with a memorandum supporting the general belief of the Association, but laying stress on the industrial development of the West. He gave details of the manufacturing development in Winnipeg and other Western cities, and named the various products manufactured in Manitoba. He further outlined the possibilities for the establishment of textile industries for the benefit of the sheep-raiser and the Western farmer and city dweller; and of leather manufacturing industries and industries manufacturing food products.

"The West as yet is mainly a producer of raw products and importer of finished products," said Mr. Dyson. "The West as yet has merely been a hinterland on which industrialized centres have drawn for raw materials and out of which they have made vast profits. The West wants to be industrialized and must be industrialized in its own interests. . . The fiscal system which has industrialized the East must be continued until the West has realized its possibilities and the demands of those whose interests are centred on the production of a single crop should not be given weight when the future development of the West is at stake."

A. C. Hornberger, representing the manufacturers of fertilizers, advocated the continuance of the present tariff policy. He presented figures illustrating the extent of the industry and showed that its destruction would mean a considerable loss of revenue to the government in the shape of duties on raw materials imported. Through the removal of the present protection the fertilizer business in Canada would be placed in the hands of American manufacturers who might exploit the Canadian market with fertilizers of inferior grades. The selling territory of Canadian manufacturers was limited, whereas the much larger plants in the United States had a greater territory and could ship in every direction. The loss of the industry to Canada would cut down the freight business of Canadian railroads, as more than $743,000 per annum was paid for the delivery of fertilizers to respective destinations in Canada.

Figures were presented to show it was cheaper to buy Canadian-made fertilizer than to import American fertilizer and pay the duty on it. Manufacturing costs were admitted to be higher owing to the fact that the tonnage consumed did not make large plants profitable, and the industry was handicapped through not having labor-saving machinery. Materials cost more through higher freight costs and unfavorable exchange rates, but "a properly protected Canadian fertilizer industry will lead to industrial expansion of considerable importance." The importance of a fertilizer industry to a country was emphasized at length, and the educational work being prosecuted by the Canadian industry was referred to.

Prices Would Increase

"If the Canadian fertilizer industry was crippled by the removal of duty," declared Mr. Hornberger, such an act would immediately destroy the conservation of Canadian waste products now exercised by them. Moreover, it would mean a strong likelihood of prices of fertilizer being increased, since our supplies would be entirely in the hands of the American manufacturers. The American manufacturers, once in control, would certainly maintain their present prices, hence the removal of duty would not only fail to benefit the Canadian farmer, but would work positively against his interest. A retention of at least the present protection of 10 per cent. will stabilize the Canadian fertilizer trade and prevent the exploiting of the Canadian market with fertilizer profitable to the United States manufacturers but not best for the Canadian farmer."

Questioned by Sir Henry Drayton, Mr Hornberger stated that they did not use the American manufacturers' price as their unit in calculating cost, but took

Opening Session of the Tariff Inquiry

To the right are seated the members of the Special Committee of the Cabinet conducting the Inquiry—Sir Henry Drayton, Chairman, and Hon. G. D. Robertson; in the foreground are the representatives of the press; to the rear, the representatives of the C.M.A., among whom will be noticed the President, J. S. McKinnon; J. E. Walsh, General Manager; J. T. Stirrett, General Secretary; S. R. Parsons and J. R. K. Bristol, Manager Tariff Department. R. A. Pringle, K.C., representing the textile industry, sits on the left.

the cost of raw materials, including freight and overhead, and added a reasonable profit. He represented seven plants, three in Toronto, one in Hamilton, one in Ingersoll, one in Chatham and one in Wingham. Materials represented 65 per cent. of the cost of production. Nitrate of soda came from Chili, potash from France and Germany and acid phosphate from the United States. The latter would shortly be made in Canada.

The Textile Industries

R. A. Pringle, K.C., Ottawa, representing the textile manufacturers of the Dominion, traced the history of protection in Canada from the time it was augurated down to the present day, and pointed out that for forty years the leaders of all parties which have been in power have recognized the need for a protective tariff. To-day, the tariff was lower than it had been for forty years, averaging less than 23 per cent., or 6 per cent. less than the tariff of 1897. Declaring that they must be guided by experience. Mr. Pringle said that the wealth of the United States had developed under a protective policy, and agricultural industry had as well made very great progress. He referred to the menace of Japanese competition, declaring that Canadian manufacturers must receive a full measure of protection if they were to compete.

Prior to the adjournment Mr. Pringle submitted figures showing that the assertions that some textile industries had made enormous profits of recent years were erroneous. He contended that, if they had made great profits, they had taken correspondingly great risks, and that for many years they had paid no dividends whatever.

The Second Session

September 15.—Mr. Pringle resumed his argument. Referring to the large profits of the textile companies, he claimed that this was no argument against protection, for in Great Britain the textile industry had made greater profits than had been made by the textile industries of Canada or the United States. The grain-growers had made profits estimated at 500 per cent., but no criticism could be made of that for they had taken correspondingly big risks. Dealing with the profits of the Paton Manufacturing Co., he claimed that these profits should be figured on the capital employed and not on the capital stock. He refuted the statement that protection invariably raised prices. As for the reduction of duty advocated on British imports with the request for free trade in five years, he declared that there was nothing uncertain about that and that it would mean the destruction of billions of dollars invested in this country.

D. W. Buchanan spoke on behalf of the Single Tax League of Western Canada. He summarized the position of this body by saying that in their opinion it would be greatly to the advantage of the people of Canada if the customs tariff were entirely abolished. They realized, however, that to abolish the tariff at once would cause a great deal of disturbance and dislocation of business. Therefore they were prepared to see the change brought about gradually, as was advocated in the farmers' platform.

Winnipeg Industries

W. A. Lawson, Bemis Bros. Bag Co., stated that if bags were allowed to come into Canada free of duty, it would be necessary for them to close their Winnipeg plant and supply the Canadian market from the United States. They had $1,000,000 invested in their business; employed 100 hands and had a payroll of $100,000.

Questioned by Sir Henry Drayton, Mr. Lawson stated that the rate of duty on bags, when they established their industry in Canada in 1906, was about 25 per cent. It had since been lowered. They

secured their burlap from India, paying a duty of 7½ per cent., plus 1 per cent. sales tax.

J. H. Parkhill, president of Parkhill Bedding Co., Limited, presented a brief statement giving statistics of this company, stating that the industry was organized and the capital invested as the result of the market protection provided by the existing tariff.

Wood and Iron Workers.

J. S. Menzies, Stewart Sheaf Loader Co., Limited, speaking on behalf of local wood and iron working industries, pointed out that higher wages were being paid in Winnipeg than in the United States, and that operation costs were higher owing to the long winters and the necessity of lighting and heating plants. Further, freight rates were heavy, particularly on raw materials. The industries represented by him had an investment of $3,882,000, employed 4,000 hands, and produced goods annually to the value of $4,825,000. Had it not been for the tariff, their business would never have located in Canada. Answering questions by Sir Henry Drayton, Mr. Menzies complained that the tariff on spare parts for farm machinery was much heavier in proportion than on the completed articles.

J. E. Vogan, Leadlay Mfg. Co., representing knitting mills and manufacturers of shirts and overalls, stated that there were eight companies in Winnipeg making shirts and overalls, using $1,500,000 capital, employing 750 persons, and producing goods to the value of $2,500,000 annually. A substantial proportion of the materials used were purchased in Canada. The knitted goods industry in Winnipeg gave employment to 200 people, used approximately $750,000 capital, and produced about $1,500,000. The chief source of supplies was England and Canada. If the Canadian tariff were withdrawn or substantially reduced, United States manufacturers would cut into the Canadian market with serious results to the industry.

Sheet Metal Products.

W. J. Willson, Western Steel Products, Limited, spoke on behalf of the sheet metal industry of Winnipeg. These companies had an invested capital of about $1,500,000, employed upwards of 500 hands, and had a turnover of approximately $2,500,000. These industries depended for their existence upon the continuance of a policy of adequate protection.

J. P. Haig, Crown Oil Co., Limited, asked that fuel oil be imported duty free, the same as crude oil.

MEDICINE HAT

September 17:—The Commission held a sitting at the City Hall. Charles Pratt, Medalta Stoneware, Limited, chairman of the Medicine Hat Branch of the C.M.A., presented a statement on behalf of the manufacturers of Medicine Hat, strongly supporting protection for the industries of Alberta and particularly for the industries of his own city. Mr. Pratt pointed out that 15 years ago there were only four factories in the district, these employing 35 people. Now there is an annual output of $14,000,000, with 3,000 of the city's population dependent upon the industries for their living. These factories gave employment to farmers in the winter months, thus compensating them for repeated crop failures. Medicine Hat wanted more new industries, but factories constructed now at the prevailing high prices for building would have to contend against the product of industries established in the United States when building costs were much lower. There was a further drawback on account of climatic conditions, which made it necessary that factories in Alberta should be more carefully constructed.

Speaking more particularly for the clay products industry, Mr. Pratt told how this industry had been established on a working basis in 1916 and how it now gave promise of dominating the western markets, while shipping also to Ontario and Quebec. While admitting that the industry might get along in the west with slightly less protection, Mr. Pratt stated that it could not succeed in the east without it and the eastern market was necessary for its development.

The Duty on Tractors.

J. E. Davies, Alberta Foundry & Machine Co., Limited, presented a brief in favor of the re-establishment of the duty on tractors. This showed that from February, 1918, to May, 1920, no fewer than 25,199 tractors were imported into Canada, duty free, from the United States, following the partial removal of protection to the industry. They were valued at over $23,000,000. If made in Canada they would have provided continuous employment at high wages for five thousand men. Mr. Davies was confident that the policy of admitting low-priced tractors was creating employment in the United States and unrest in Canada. Under protection, the tractor industry would have developed other allied industries.

For the coming year, Mr. Davies estimated that 10,000 tractors would be sold in these western provinces, practically all of which would be imported. He admitted that Canadian-made tractors might cost a little more, but that would be due to revenue-producing duties which had to be paid on fuel, materials and equipment not obtainable in the Dominion. The commissioners were reminded that nine reliable manufacturing concerns were ready to produce tractors at the time the free trade order was issued. These firms, without exception, have lost money and have either abandoned the tractor industry or will do so. Asked by Sir Henry Drayton whether Canadian manufacturers could look after the market, if a duty was put on, Mr. Davies stated that within a year it could be done.

J. B. Swan, president Ajax Coal & Mining Co., made a statement in favor of abolishing the business profits war tax. Such a tax might be all right under war conditions, but it was unfair in time of peace. As a farmer, holding 2,000 acres, he considered that the only disability the farmer in that section of Alberta suffered from was lack of rain.

VANCOUVER

September 20:—J. B. Thomson, Jas. Thomson & Sons, Limited, chairman B.C. Division, C.M.A., presented a general statement endorsing the statement submitted by the C.M.A. at the first session in Winnipeg and including information and statistics having special application to British Columbia. He said that there were in the province, exclusive of logging and mining industries, 1,688 manufacturing establishments, of which 700 were in Vancouver. Forty thousand persons were employed and the annual production was valued at $40,000,000.

Nichol Thompson, Canadian representative of Cammell & Laird, England, representing the iron and steel industry, advocated continued protection for this industry and urged that all reasonable measures be taken to encourage this development in British Columbia. Witness thought federal assistance should be given in the form of a bounty towards the establishment of a steel industry. He recalled that some $21,000,000 had been paid by the Government to eastern smelting plants as bonuses; that this bounty system had helped to build up eastern industry and that the Government accordingly should be no less generous to British Columbia. The Government might also rebate any duties paid on machinery imported for the operation of the smelter. An argument for protection was that nearly 200 metal product manufacturing companies, who would be customers of the proposed smelter, would be kept alive, also the shipbuilding plants.

W. H. Barker, chairman of the Board of British Columbia Packers' Association, representing the canned salmon industry, presented a statement giving statistics of the industry regarding its development and the necessity of maintaining the tariff on its products. He said the industry employed 20,000 persons, 2,000 of whom were Indians who would otherwise be an expense to the country. The output was $14,000,000 annually. American fishermen get the first chance at the fish on their way up the coast; they give less care to the canning; they are not obliged to pay such high licenses; they have a larger market; they operate larger canneries and thus have lower overhead costs; they escape the duty on the tin plate used for the cans, which amounts to 12½ per cent. in Canada; and they would put Canadian canners out of business if any lowering was made in the duty. Also there was a threatened Japanese invasion of the cannery market.

W. H. Minthorn, dairyman, New Westminster, appearing on his own account, advocated a revenue tariff instead of a protective tariff, which, he said, caused combines and increased the cost of living. The chairman drew from him the information that he was selling milk in Vancouver at six quarts for a dollar.

Permanent Board Advocated.

A. B. Weeks, president of the B.C. Manufacturers Association, outlined the policy of that organization and advocated the appointment of a permanent tariff board, which would hold regular sessions all over Canada to consider the peculiar needs of each district. As a temporary solution of British Columbia's industrial difficulties, he suggested that plants wishing to start new operations should be permitted to bring in machinery free of duty for a stated period until Canadian plants were in a position to supply their needs.

J. A. Cunningham, B.C. Refining Co. and past president of the B.C. Manufacturers Association, made a general statement and suggested various changes in a number of tariff items. Among these he wanted flotation oils for mining purposes brought in free, as mixtures of oils for this purpose differed in different industries and the effect of the present duties was to penalize certain industries; he wanted the duty taken off rape seed oil, as well as off crude oil or tapped oil and fuel oil for refining purposes.

H. L. Cliff, president of Dominion Canners, B.C., Limited, representing the fruit and vegetable canning and jam manufacturing industries of British Columbia, stated that they had an output of $3,500,000 annually, of which $800,000 was paid to farmers. Fifteen hundred hands were employed during five months of the year. The removal or even substantial lowering of the tariff would result in the destruction of the industry.

Not Altogether a Dull Affair

Hon. G. D. Robertson, Sir Henry Drayton, and Roderick McKenzie, Vice-President Canadian Council of Agriculture, find something to laugh about in the intervals of the Tariff Inquiry.

Comparative figures submitted showed the majority of prices considerably under American quotations.

Major J. C. Thorn, president of the Canada Western Cordage Co., explained that this enterprise represented the aspirations of a number of returned soldiers. Their output would be 2,000,000 pounds at the outset. He asked for the retention of the present tariff against U.S. importations, and new protection for binder twine and fish-net twine, claiming that this would enable them to build up an industry that would give work to returned soldiers, low-priced twine for the farmers of the Middle West and a new market for the flax fibre of Ontario and Quebec.

F. R. Stewart, representing the wholesale fruit and produce interests, asked for a revision of the tariff on certain fruits.

September 21:—A. Berry, president of the Fraser Valley Milk Producers' Association, presented a strong case verbally in favor of protection and asked that the tariff on milk, cream and the products thereof should be maintained. He stated that 90 per cent. of the milk produced in the Fraser Valley was controlled by the association and 40 per cent. was distributed in Vancouver. The price set for milk sold to the condensers was slightly above that paid by the U. S. factories. If the 17½ per cent. protection on milk and milk products was removed, Washington producers would be able during the flush season of production to flood in their milk to the condensers at lower prices than those asked by the milk producers of the Fraser Valley. This would lead to higher prices to consumers in the winter in order to enable producers to recoup themselves.

J. J. Plommer, Clayburn Co., Limited, Vancouver, speaking on behalf of his own industry, asked that a duty should be levied on all fire-brick entering the country instead of on certain sizes only as at present. This would enable the fire-brick industries of Nova Scotia and B.C. to hold the business of Central Canada against the short haul from the United States.

H. A. Stone, representing the Wholesale Dry Goods Section of the Vancouver Board of Trade, strongly supported protection, and said that the removal of the tariff would be injurious to all the interests which he represented. He also stated that as a wholesaler he could say that Canadian manufacturers had not taken advantage of the tariff in the lines of goods in which he dealt. They had been and were still able to purchase and supply articles of wool, cotton, silk and other materials of Canadian manufacture at considerably lower prices than similar goods could be obtained from Great Britain, the United States, or any other country.

W. H. Barker, chairman of the Board of B.C. Packers Association, submitted additional evidence containing information requested by the Commission.

VICTORIA

September 22.—A. C. Flumerfelt, appearing as a private citizen, presented a brief strongly favoring the retention of the present policy of protection. He pointed out that the transportation system had grown up under this policy and consequently had been enabled to furnish the necessary service to all classes, including the farmers. Had it not been for the existence of business produced

by manufacturing and allied interests, the railways would not have had sufficient revenue to enable them to give the present low freight rates to farm products moving from the interior to ocean ports.

Industries of Island.

J. C. Pendray, British America Paint Co., Limited, submitted a statement giving a list of the industries of Vancouver Island, the articles manufactured, number of employees, wages paid and the extent and value of the natural resources of the Island. Vancouver Island had an area greater by from 25 to 30 per cent. than Holland or Belgium; a climate similar to Great Britain; great coal, lumber and fishery resources; water power estimated at 270,000 h.p., and with strategic advantages for foreign trade. With protection capital could be induced to come into the Island and develop its resources. So far as his own industry was concerned, it represented an investment of $600,000; it employed 100 persons and paid out annually $1,000,000 in wages. Linseed oil worth nearly $200,000 was brought from Medicine Hat and white lead worth $100,000 from Trail, while other materials were bought in Canada. Prices compared favorably with those in the United States.

Labor Man's Views.

E. S. Woodward, secretary of the Trades and Labor Council of Victoria, speaking as a private citizen only, opposed all tariffs whether protective or revenue, on the ground that they were a tax on the consumer and bore too heavily on the man with a large family.

R. W. Mayhew, Sidney Roofing and Paper Co., Limited, stated that his company were just commencing to manufacture building paper, adding 75 employees to their staff. They will supply three-fourths of the market west of Regina. The tariff permitted this industry to be started and the protection should be continued as the cost of gathering rags, etc., in the sparsely settled communities of B.C. was greater than in San Francisco and Los Angeles, where their competitors were located. They required $240,000 worth of rags and waste paper.

W. F. H. Thompson, appearing as a private citizen, strongly opposed free trade, and said that its introduction would be most injurious to the interests of Vancouver Island and the rest of British Columbia.

H. A. Leigh, Brackman-Ker Milling Co., put in a statement representing his own industry, asking that the tariff on the products thereof be maintained.

VANCOUVER

September 24.—J. D. McCormack, manager of the Canadian Western Lumber Co., representing the B.C. Lumber and Shingle Manufacturers' Association, presented statistics of the lumbering industry and asked that the present tariff on the articles they manufacture be retained. He informed the Commission that in the industries represented, which included logging, saw-milling, shingle-milling, pulp and paper manufacturing, planing mills, box, sash and door factories, there was an annual payroll of over $31,000,000, going to 26,000 men. They have to face in Western Canada the competition of the U.S. lumbermen of Washington, Idaho and Montana. In the east they have to meet the duty-free imports from the Southern States. The foreign market demands the best, but only takes about 30 per cent. of the output. If the foreign market is to be expanded, which is desirable, the Canadian market must be developed at the same time, and this cannot be done unless the present tariff is maintained or extended. Difficulties with respect to higher freight rates and higher wages, in comparison with the lumber industry of the Southern States, were enumerated. Duty-free lumber importations into Canada from the United States have increased from 114,000,000 feet in 1910 to 300,000,000 feet in 1920.

J. H. McDonald, of the B.C. Manufacturing Co., Limited, New Westminster, representing the Box Manufacturers' Section of the C.M.A., gave statistics of the box manufacturing industry in B.C., and showed that the industry was supplying its proper share of the home market at reasonable prices, asking that the duties on the articles manufactured be retained. He also asked that a duty be placed on veneer, which is now on the free list.

John Robertson, barrister, appearing for clients, advocated absolute free trade on the ground that a protective tariff was liable to cause war between countries. He asked that various materials imported by his clients, which now paid duty, should be admitted free.

Retain Duty on Fruit.

Joseph Arnold, fruit grower, Chilliwack, speaking on behalf of the fruit growers of Chilliwack, urged that the present tariff on fruit grown by them be retained. He stated that the removal of this tariff would ruin the fruit-growing industry of Chilliwack, as carloads of fruit would be dumped into British Columbia from Washington. Figures were presented to show that Canadian consumers do not suffer from the duties.

M. H. McGough, T. J. Shore Bolt & Nut Mfg. Co., Vancouver, asked that the duty be removed from certain articles which were imported by them as raw materials.

H. A. Stone, a director of Gault Bros., Limited, representing the Wholesale Dry Goods Section of the Vancouver Board of Trade, submitted price lists showing comparisons of prices paid by wholesalers for Canadian textiles with those paid for U.S. and British textiles. These comparisons were most favorable to the Canadian manufacturers and made a strong case.

VERNON

September 27.—A great many farmers and fruit growers were present from a radius of fifty miles. The general case presented by the combined evidence in favor of protection was very strong, no contrary evidence being developed.

W. F. Laidman, vice-president of the B.C. Fruit Growers' Association, headquarters Vernon, B.C., presented a general brief on behalf of maintaining a protective tariff on fruit. The growers want the Western Canadian market preserved in order that, with a large market at stable prices, their rapidly developing industry may not be discouraged, as it would be if the lower grade apples of Oregon and Washington could be sold in years of over-production.

Fruit Men's Case.

R. M. Wilson, secretary of the B.C. Fruit Growers' Association, presented a detailed brief dealing with each kind of fruit and showing why protection was needed for B.C. fruit growers against fruit growers of the North-Western United States. B.C. production of apples showed an increase from 685,000 boxes in 1914 to 2,524,132 boxes in 1919. In 1914 one-third of Western Canada's requirements were supplied by British Columbia, but in 1919 96 per cent. came from British Columbia, while nine hundred cars surplus were shipped to Eastern Canada, Great Britain and the United States. In British Columbia more than 4,000 fruit growers have plantings aggregating 40,000 acres and have invested $35,000,000 at least. Though only 60 per cent. of acreage is full bearing, shipments in 1919 of 5,000 carloads were valued at $7,775,000. Mr. Winslow also showed that the prices of fruit applied to the prairies by the B.C. Fruit Growers Association compared favorably with the prices for imported fruit.

C. G. Barnes, president of the B.C. Fruit Growers Association, gave statistics to show that the cost of irrigating land in the Okanagan Valley is much higher than irrigating competing fruit lands in Washington and Oregon.

The Comments of Canadian Editors on the Tariff Question Reviewed

VERDICT OF THE CANADIAN PRESS

EDITORIAL comments on the work of the Tariff Commission and the statements presented at its first session in Winnipeg by the Canadian Manufacturers Association and the Canadian Council of Agriculture have been numerous, and, it might be added, significant. Most Canadian newspapers took note in their editorial columns of the proceedings and expressed their views on the merits of the respective arguments. On the whole it may be stated that the stand taken by the press of the country has been most encouraging to those who are fighting the battle of industrial progress. Very few papers indeed have shown themselves to be openly hostile to the position taken by the Canadian Manufacturers Association. Some few have adopted a middle course, though in so doing they have tacitly admitted that the manufacturers' case has merits. The large majority have come out frankly in favor of safeguarding the interests of national industry. In order that readers may be in a position to judge for themselves the attitude taken by the press, the following résumé of editorial utterances is given:

Opinion in Hamilton.

Hamilton's three dailies, with varying degrees of fervor, threw their support to the protective principles. The *Hamilton Spectator*, weighing the merits of the two arguments in its issue of September 16, casts its vote in favor of the manufacturers, summing up with the remark that,—"It seems certain that Canadian industry is vitally dependent upon the retention of an adequate tariff; it is just as certain that the farmers' prosperity depends to a large extent upon the development of the national industries. The two classes are inter-dependent; their interests are identical. An impartial study of the arguments on the side of the existing National Policy as expounded in the brief of the C.M.A. will reveal their strength and soundness. The farmers have themselves done very well under that policy; they should be content to leave well enough alone."

The *Hamilton Herald* was equally pronounced in its view that "free trade might for a time be a paying policy for the men who mine the western soil for wheat in their eager efforts to get rich quickly; but it would be a mighty bad policy for farmers generally as well as for the other producing interests." On September 15, the *Herald* referred to Thomas Findley's evidence as a rebuttal of the favorite plea of the farmers' political organization that the protective tariff was being maintained wholly for the benefit of the Big Interests. "Mr. Findley declared that his company would prosper more under free trade than under the existing tariff, but it would prosper at the expense of Canadian national interests," said the *Herald*, adding that western farming conditions are rapidly changing; that total dependence upon wheat production is giving place to mixed farming and that Western Canada is fast becoming industrialized.

The *Hamilton Times* was less enthusiastic about the manufacturers' case but admitted in the issue of September 15 that "the financial condition of the country is such that a tariff is necessary" and that "most people are also agreed that some protection is necessary for our manufacturers." The *Times* endorsed the liberal party platform.

Good Policy for Brantford

The *Brantford Expositor* was inclined to adopt what it described as a "middle of the road" policy but insisted on September 18 that "it is not in the general interests, nor even in the interests of the farmer, to endeavor to deprive the agricultural implement industry of all measure of protection against the American manufacturers. . . . . The *Expositor* rejoices at the number of branches of American manufacturing industries which have been located in Canada and at the amount of capital they have invested here and the number of men to whom they have given employment. . . . . It has been good policy for Brantford and for the country as a whole that these and like industries have been encouraged to locate in Canada and in the consideration of the tariff problem it has to be determined whether or not this policy is to be continued or the Canadian market is to be left open to the unrestricted exploitation of American manufacturers."

Would Produce Slump

The *Guelph Mercury*, in its issue of September 15, pleads for a policy of co-operation between the two great interests involved, though it admitted that "if Canadian industries are to be sacrificed in the East to pacify the West, the cities and towns might become waste places and population be driven, not to the farm, but to the larger industrial centres of the United States. Thus Canada would suffer, industrially and agriculturally, through curtailment of large industry and the loss of a Canadian market for the products of the farm, which would produce such a slump as would reduce the value of agriculture by half."

False Logic

The Toronto *Mail and Empire* declared on September 16 that Eastern Canadians, including farmers, would not be deluded by the pretence of the Council of Agriculture that its aims did not include "drastic legislation which would tend to unsettle and injure Canadian industry." Dealing with the agrarian party's claim that agriculture needed more encouragement and that it was desirable to fill up the vast vacant spaces of Canada, the *Mail and Empire* asks the pertinent question,—"How is this filling up process to be accomplished when the first act of the theorists proposing it is to pull down a large section of the present Canadian prosperity and send thousands of city and town workers to the United States? The closing down of many factories in Canada would not drive the urban workers, thus thrown out of good employment, back to the land—because they have not the capital or experience for farming. These workers, a valuable creative part of the population, would be simply lost to Canada. The depression in business would affect not only urban residents but the farmers themselves, lowering their property values, diminishing their markets and depreciating their investments." The *Mail and Empire* concluded with the observation,—"Farming must

always be a basic industry for this country, but to prove that it can be bettered by pulling down its great economic complementary requires more logic than the Crerarites can muster."

Must Not Tamper

The *Winnipeg Telegram* commented favorably on the purpose of the tariff inquiry in its issue of September 14 and declared that the advent of the commission came at a propitious moment. "Never have the people of Canada been so prosperous," it remarked, "and seldom have they been so intent upon discerning what the future holds for them. They cannot afford to endanger the present for the nebulous promise of some more perfect state. They will not dare tamper with the foundation they have laid for themselves and will not tolerate any Government which would experiment with the main policies of the Dominion even to the temporary detriment of its industrial progress."

Canadians Want Tariff

The *Ottawa Journal*, commenting on the fact that in British Columbia all classes appeared before the Tariff Commission and urged against free trade, declared that "Such unanimity against free trade is significant. It indicates that the overwhelming majority of Canadians want an adequate tariff, the only exception being a class in the West which has received more State aid in the past ten years than any other class in the country; a class, too, which has contributed less than any other toward the necessary revenue of the country."

Object is Free Trade

The *Toronto World* pointed out on September 16 that, while the National Council of Agriculture in its brief asked for a tariff for revenue from which the protective principle would be eliminated, yet the Council and organized farmers of the West stood for a policy of free trade with the mother country within five years. "It is little consolation for the manufacturers and their employes to know that a lingering instead of a sudden death awaits them. Free trade with Britain means practically free trade with all the world, because goods from Germany, France and the United States shipped into England free of duty can then be shipped from England into Canada duty free."

"The suspicion that manufacturers combine instead of compete is the irritant which causes some popular dissatisfaction," asserts the *World*. "Neither the farmers nor the manufacturers touched on this delicate question, but it is one of great interest to the people. The government must prevent combinations in restraint of trade and check profiteering among those who are receiving especial consideration from the government. Our people have no desire to close the factories or cripple the manufacturers. But the Tariff Commission should probe all charges of profiteering and injustice. Canadians are protectionists, but not stand-patters and a spirit of reasonableness and conciliation quickens the argument put forward by the Canadian Manufacturers' Association."

Make Existence Precarious

The *Victoria Colonist* was quite pronounced in its view, expressed on September 16, that "there is no conclusive answer to the claim of industries, put forward before the Tariff Commission, that a decided lowering of the tariff will make their existence precarious, if not impossible. . . . In opposition to the standpoint of Canadian manufacturers there is only one organized branch of industrial opinion and that is the farmers who admittedly seek a lower tariff or free trade in order that they themselves may benefit by getting farm implements and machinery cheaper. To those who have the ultimate welfare of the country at heart, no step will seem feasible that threatens industrial dislocation and widespread unemployment."

Don't Want Open Market

The *Kingston Whig*, discussing the work of the Tariff Commission on September 20, took the view that it was unnecessary to deal with the Liberal Party tariff policy because the latter had been adopted by the government in so far as it advocated a revision of the tariff downward. "We have to choose between the government's programme and that of the United Farmers who would establish free trade and devise some system of land taxation not as yet clearly defined . . . By the adoption of free trade, or even an appreciable lowering of the present tariff, it is evident that the Canadian market for manufactured goods would pass into the control of United States' manufacturers, with whose enormous capital and highly organized industries we could never compete. With an over-stocked market, our industries would be forced to close down and thousands of our workmen would be idle. Do we want a situation of this kind?"

Canada Must Keep Steady

The *St. John* (N.B.) *Standard* left no doubt as to its stand. In its leading editorial on September 14 it reminded its readers that "It is under a protective tariff that Canada has been able to attain her present prominent position in the commercial world and through it, the wealth and prosperity that her people now enjoy; and to go back on the principle of reasonable protection would be nothing short of a grave disaster." It also pointed out that "Tariff for revenue as always practised was and is necessarily the same as moderate protection and the very same as we have now."

"No country ever had a greater opportunity than Canada to make wonderful progress," concluded the *Standard*. "The cards are all in our hands if we only play them right. If we only keep our heads we will have a large flow of population and capital from other countries. The financiers of the world are just beginning to realize the tremendous extent of our natural resources and the splendid advantages we have for manufacturing development by reason of our magnificent water powers; and unless checked by immature statesmanship, we should see a great development of Canada, which will be of untold benefit to the whole people. All we have to do is to keep steady and to be sane in our politics."

C.M.A. is Endorsed

The *London Free Press* devoted attention on September 16 to the brief of the C.M.A. and endorsed its arguments. "It brings forward many points worthy of consideration," said the *Free Press*. "Among these is the fact that all over Canada free trade arguments are being used as the 'spearhead of the attack' against the National Policy under which this country has passed out from the tutelage and the dependency of years prior to 1879 into the position of political and economic preferment it occupies today."

What Farmers Want

The *Port Arthur News-Chronicle*, under the heading "The Two Sides," traced the history of the tariff in its issue of September 18. With regard to the present movement, as voiced by the Canadian Council of Agriculture, it said:—"What they want apparently is to substitute for what they claim to be class legislation, another measure that would favor another class,—their class, irrespective of the effect it might have upon the thousands of men employed in the mills and factories and other industries in Canada."

A Severe Criticism

The *Charlottetown Guardian* rapped the free trade propagandists right soundly on September 17, exclaiming how ready they were to paint the manufacturers as the big interests and the stumbling blocks to prosperity. "Wipe the manufacturers out of existence and

what kind of a country would we have?" it asked, adding that if their preaching meant anything it meant that they would fain go back to the sewing of fig leaves for clothing as in the days of Adam, and of wooden ploughs, home-made by the farmer, as in the sub-stone age. It poured scorn on the argument that an extra five dollars on an implement intended to handle a crop varying in value from five to twenty thousand dollars was a serious handicap to agriculture.

Must Walk Carefully

The *Belleville Intelligencer*, discussing the tariff issue on September 17, said that "Canada must not be handed over to theorists. We must walk carefully and act sanely. Canada's tariff policy has attracted hundreds of factories from the United States and many more are coming when they are assured that there will be no free trade foolishness."

The *Kingston Standard* had this to say of the tariff question on September 17,—"It will be good policy for Canada to adopt—to hold what they have and not, by pursuing any will-of-the-wisp policy, surrender their economic fate to any other nation or nations. Contiguous to a great republic that has grown enormously under protection, we cannot afford to leave ourselves at their tender mercies, which we would do if we were to take from our manufacturers—and therefore from our workers—adequate and necessary protection."

Must Not Be Deluded

The *Sarnia Observer* thought that if the Canadian Council of Agriculture did not have a stronger case than that presented in Winnipeg, they need not hope to make much impression outside their own ranks. "Eastern Canadians, including the farmers, are not to be deluded by the pretence of the Council that its aims do not include 'Drastic legislation which would tend to unsettle and injure Canadian industry.' The council plainly proposes the wiping out of all protection in the tariff, the institution of a tariff for revenue only and substitution of direct taxation in place of tariff revenue lost."

How Raise Revenue?

The *Montreal Gazette* in its issue of September 16, asked the pertinent question as to how necessary revenue could be raised from income and business profits taxes, if industrial enterprises were destroyed. "The Council of Agriculture frankly proposes to kill the goose that gives the golden eggs," it said. "Canada cannot afford to embark upon a sea of experimental finance. Her credit is too precious, her obligations too great to permit the adoption of fantastical financial schemes born in ignorance and nurtured in class selfishness. There is no other country in the whole world, not one, that proposes to abolish revenues from indirect taxation of a customs tariff, while several, such as Australia, are, more than ever before, employing the tariff as a shield for domestic industry."

Calls it a Menace

Montreal Le Pays summed up the situation quite forcefully on September 25, when it said:—"The agricultural exponents of free trade are struggling like devils in holy water in order to reduce that protection which is indispensable for the success of our industries. This new race of protagonists would find themselves in a nice mess should our factories close down and their employees and the general public find themselves financially unable to buy the products of the farm."

Would Living Costs Drop?

The *Moose Jaw News*, in marked contrast with the Regina and Saskatoon dailies, refrained from taking sides, but on September 16, came vigorously to the support of the commission and its personnel, claiming that the opening sessions of the inquiry gave promise of effective and beneficial results. "It is to be admitted," said the *News*, "that there is a general cry throughout the country for a reduction of the tariff. In the main this has been caused by the statement so often heard that, if such reductions were made, especially along certain lines, the cost of living would be lowered. The factors in the problem, the high cost of materials and production and the heavily increased rates of wages are ignored by people who use such a contention. The fact remains, however, that there is this general belief. It is for the purpose of discovering what accuracy there is in it, that, if the tariff can be reduced and in what direction, the labors of the Board of Enquiry will be directed. That is not the policy that would be adopted by either the Hon. Mackenzie King or the Hon. T. A. Crerar. What they are demanding is a reduction of the tariff all round. They ignore the fact that a thorough investigation into present conditions may reveal the fact that, whereas on the one hand, considerable reductions may be made in the customs duties, on the other it is possible they may be increased without any injustice being done. Those who are demanding the total abolition of the tariff now or in the near future, will get no satisfaction from the enquiry."

Committed to Protection

The *Edmonton Bulletin* on September 16, took the line, that, as the government was committed to the policy of protection, any controversy over the general question of a protective versus a revenue tariff was aside from the point. "It is argument," declared the *Bulletin*, "on a matter that lies without the jurisdiction of the commissioners. They have not been sent out to find out which of these general policies the country wants, will not concern themselves with that question and it would make no material difference if they did. It has been decided that the country is to have a protective policy during the lifetime of the present government, willy-nilly. Only within the scope of that prescription is the Tariff Commission qualified to make enquiry. . . . . The business of the commission is to find out how the protective policy can be put into effect so as to produce the least resistance. The kind of medicine having been decided upon, the commission is sent out to discover how to administer the dose without producing convulsions in the body politic.'

Majority Favor Tariff

The *Fredericton Gleaner*, referring to the C.M.A. statement on September 17, said, "There is no doubt that a majority of the people of Canada favor a protective tariff; the advantages of such a tariff have already been demonstrated; the results have reasonably met expectations."

Are After Facts

The *Vancouver Province*, referring to the first session of the tariff inquiry, brushed aside the opposing briefs of the manufacturers and agriculturists with the comment:—"Neither is a novelty to the commissioners or to the public. The purpose of the commission is not to hear these general statements of principle, though they have their value in arriving at an economic basis. Commissioners will be more concerned to learn at first hand how the present tariff bears upon individuals and communities in actual practice and in what details it can be amended to the general advantage."

C.M.A. Well Organized

The *Moose Jaw Times* paid its respects to the C.M.A. on September 16, stating that this organization was taking full advantage of the commission to put its propaganda across and "Being better organized for this work than are the people whom they exploit, they are in a much better position to use the commission to further their ends. Evidence of this is found in the carefully prepared statement of the manufacturers' case at

the Winnipeg sitting and just as carefully prepared plans for its circulation among the people by full-page advertisements following up the Press reports of the proceedings." The *Times* suggested that the arguments advanced on behalf of the manufacturers might produce opposite results to what they expected and repeated the claim of the farmers that their demand was not for free trade, but for tariff reduction, in which they were in accord with the fiscal policy of the Liberal Party.

Is Morally Wrong

The *Calgary Albertan*, after describing the Council of Agriculture's statement as "Brief, concise, forceful and clear," proceeded to attack the protection principle in its issue of September 16. It meant a levy on the wealth of the many for the advantage of the few and was, in its opinion, morally wrong. As for being unable to get revenue otherwise, that, it characterized as a reflection upon the intelligence of the people.

An Oracular Utterance

The *Winnipeg Free Press*, in its issue of September 16, discussing the arguments presented before the Tariff Commission, refrained from taking sides definitely but pronounced the somewhat oracular opinion that the third party programme would not likely succeed unless it was right and, if it was right, its application would be for the national good. "Therefore," it concluded, "we see no occasion for anyone to worry, notwithstanding the gloomy possibilities of the future set forth in the memorials embodying the protectionist appeal, submitted to the Tariff Commission." The *Free Press* characterized the C.M.A. brief as elaborate and able, while it referred to the Council of Agriculture's memorial as being radical only in its implications. "Revenue requirements and the caution which responsibility instills would probably make the first attempts at tariff revision by a Progressive Government highly tentative," it explained.

Opposition in Regina

The *Regina Leader* and the *Saskatoon Phoenix*, publishing the same editorials on September 16, voiced the most outspoken criticism of the manufacturers' statement that appeared in any Canadian daily newspapers. It was described as "A frank and unblushing demand by the vested interests for the continuance of their privileges." "The manufacturers," declared these two Saskatchewan papers, "made a specious attempt to show that there is no half-way house between protection and free trade. But in this they necessarily became involved in their own previous statements that the tariff is necessary to provide national revenue. For if it be practicable to obtain revenue while providing protection for manufacturing industry, it is obviously practicable to provide considerably less protection without losing revenue from the tariff. In fact, tariff revenue will increase in proportion as the duties do not exclude imports, that is, provide protection; and in proportion as the tariff is protective—which is what the manufacturers want—it will fall short as a revenue producer." Both papers contended that the deficit argument was beside the mark, claiming that "any finance minister who set out to remove the protective effects of the tariff could raise by it, while doing so, as much revenue as at present; but if he did reduce the revenue from that source, he could easily find direct taxes with which to replace it."

Inquiry Limited

The *St. John Telegraph* did not discuss the issue before the commission on its own merits but linked it up with the political situation, declaring on September 16, that—"The Meighen Cabinet will finally decide the nature of tariff revision to be carried out and so the work of the so-called Tariff Commission of Inquiry is limited at the outset by the views of Hon. Mr. Meighen and his Conservative associates, who dominate the administration."

Attempts an Analogy

The *Regina Post*, in a less extreme editorial utterance on September 17, took note of the manufacturers' claim that without the tariff they would be unable to compete successfully with the manufacturers of the United States and their factories would be closed and their employees be forced to migrate or engage in other occupations, but did not attempt to answer this argument except by saying that "The only exception to this rule of evidence is the statement, reasoned and complete, presented by the Secretary of the Canadian Council of Agriculture."

Taking as text the claim of the latter that "Production and trade in Canada have been forced into narrow, unnatural and uneconomic channels through the application of protective duties," the *Post* referred to the way certain cities in Canada had in the past succeeded by means of bonuses, exemption, etc., in getting industries established without proper regard for markets, transportation facilities, supply of raw materials, etc. "We doubt if there is a city in Canada to-day that has not grown too wise to repeat the experiment. Yet that foolish policy is exactly what Canada adopted as a "National Policy" some forty years ago, using a protective tariff as the form of bonus. Are we to be handicapped forever by that foolish policy? Or are we going to try to bring about development in an orderly and economic way? This is in effect the query which the Canadian Council of Agriculture laid before the cabinet committee."

Can They Compete?

The *Victoria Times*, dealing with the tariff question on September 16, questioned the contention that Canada's manufacturing industries could not exist without the present protective tariff. "If Canadian goods can compete with American and British goods in the United States and Great Britain, they certainly can do it in Canada under moderate tariff conditions," it argued. The *Times* did not think it complimentary to the manufacturers themselves, who were exporting $600,000,000 every year to competitive markets, to say that they could not exist without a high tariff wall.

Free Trade Impracticable

The *Brockville Recorder*, under the caption, "Why befuddle the issue?" claimed, on September 21, that the C.M.A. were spending hundreds of thousands of dollars in advertising the benefits of high tariff and protested against the suggestion that the contest was between high tariff and free trade. "This simply is not true," declared the *Recorder*, "for outside of a comparatively few people in Canada no person contends that a fiscal policy of free trade is practical. There must be a tariff and surely will be one, because it is one of our adopted methods of raising revenue and Heaven knows it will require all our skill and patience to meet the financial demands on the country."

Criticized C.M.A. Brief

The Toronto *Globe* showed itself decidedly critical of the brief presented by the C.M.A. In its issue of September 16, it questioned the contention of the Association that only between 16 and 18.5 per cent. of all the produce of Canadian farms was exported in the manufactured state, while between 81.5 and 84 per cent. was marketed in Canada. "When the batteries of the Grain Growers are unlimbered and directed upon this statement made by the Canadian manufacturers to the Tariff Commission it will be riddled at the first round," declared the *Globe*. "How it came to be made at all by men so shrewd as the leaders of the Canadian Manufacturers Association passes comprehension, for

is demonstrably inaccurate in two important respects,—it overestimates greatly the total value of agricultural products for which a market must be found, and it underestimates to an even greater degree the proportion of the total sent abroad." The *Globe* then proceeded to work out the percentage on its own account, finding that the home market absorbed in the vicinity of 63 per cent. of the marketable surplus of Canadian farms.

A Play Upon Words.

In its issue of September 17, the *Globe* took issue with the C.M.A.'s statement that "all tariff revisions are governed by a guiding principle, and this guiding principle must be either the policy of protection or the policy of free trade." "The statement is a play upon words," replied the Globe, "intended to present the tariff issue as one in which there is no middle ground and as a direct conflict between protection and free trade. No such arbitrary line can be drawn between any of the policies upon which the parties will appeal to the country." The *Globe* then proceeded to compare the relative positions of the farmers and the Liberals, pointing out that the principal difference between them was with regard to the British preference. Concluding, it declared that —"The battle is not at present between free trade and protection, but between those who would use the tariff first and foremost for the advantage of special interests and those who seek to adjust it so that it will bear less heavily upon the necessaries of life, and so that more of its proceeds will be diverted to the public exchequer and less to the pockets of the few."

A Good Argument.

Montreal La Patrie, in a well-reasoned editorial, on September 15th, said that the manufacturers "have a good argument for inducing the farmers to make concessions by making them see that protection applied for the direct benefit of industry, indirectly benefits agriculture. Industry cannot be protected except by the tariff. If, on its side, agriculture does sell its products in face of free competition from other producing countries, it cannot claim that it enjoys no protection from the state. Agriculture, as a matter of fact, has always been the object of consideration from our public governments. The provincial and federal administrations have not failed to set aside for it annually, in the form of subsidies, a large part of their revenue. It is for the purpose of opening up outlets for the agricultural production of the western provinces that the country has taken upon itself such heavy burdens in order to construct an immense system of railways, in advance of the normal requirements of the country and of the agricultural districts themselves. It can, therefore, be said that the farmers enjoy in our country a protection at least equal to that accorded to the manufacturers, although this protection does not come to them principally from the customs tariff. Neither does the tariff ignore them where the tariff can operate reasonably to their advantage."

Good from the Inquiry.

The *Winnipeg Tribune* thought "That the earnestness that was exhibited by the various interests that appeared to present their cases may be taken as symptomatic of what will happen throughout the West, where the habit of plain speaking has always been cultivated." The *Tribune* expected that some good would come of the inquiry.

No Radical Change Possible.

The *Vancouver World* took the attitude that, general principles having already been laid down with regard to the tariff, only details of their application were now under consideration. "What the Tariff Board has to do, therefore," it remarked on September 20, "is not to lift the burden of customs duties—which would mean that the same public would carry it, but in the capacity of taxpayers rather than that of consumers—but to adjust it so that it will be distributed fairly all around. For these reasons advocacy of free trade, single-tax, or other revolutionary change in the fiscal system at present in force in Canada before the Tariff Commission, will be without any possibility of practical effect, however valuable it may be from the point of view of the advocate, as propaganda."

Criticized the Statement.

The *Grain Growers' Guide*, as might have been expected, had little use for the manufacturers' presentation of their case at Winnipeg. "Whatever merits or demerits the statement as a whole possesses as an argument for protection," it declared, "it was of no earthly use to the commission as an assistance in determining what protection, if any, assuming that the policy of protection has to be maintained, particular industries ought to have. . . . In not a single case in which retention of tariff protection was urged was there any effort at all to show in a definite, concrete form why protection should be granted and to what extent. Not a representative of manufacturing went beyond the bald informative statement that because some money was invested in his concern and some men employed he should be sheltered from outside competition."

Sceptical of Attitude.

The *St. John Times and Star* was of the opinion that "It will not be the fault of the Canadian Manufacturers Association if the Canadian tariff is not made even higher than it is." In the course of a short editorial on September 16, the *Times* criticized the attitude of the Canadian manufacturers declaring that they "Are intensely patriotic when the tariff is in danger. If they were as careful not to squeeze out of the consumer the last dollar the tariff permits, their protestations would be received with less skepticism."

Wide Publicity to Association's Tariff Statement

In order that the statement prepared by the Association for submission to the Tariff Commission should receive the widest possible distribution, it was decided that the Publishing Committee should arrange for its publication as a paid advertisement in the daily and farm press of the Dominion, immediately following its presentation to the Commission at Winnipeg. This programme was successfully carried out, with the result that the statement enjoyed a circulation of over 2,600,000 copies, and presumably went into practically every home in Canada.

In addition, many thousands of copies of the statement were struck off in pamphlet form and distributed in this way, thus increasing the force of the arguments advanced. Members of the Association were circularized from head office and informed that copies of the statement were available in any desired quantity for distribution to employees or customers, and in response orders for many thousands of pamphlets were received. This offer still stands open, and any member who feels disposed to forward the statement to any interested parties is invited to send to the head office for a supply.

The Association is also sending a copy of Thomas Findley's statement with regard to the implement industry to the editor of every paper in Canada with the request that the facts in regard to one of the greatest of Canadian industries be placed before the public..

The Maritime Fishing Industry and the Obstacles to its Progress

By COLIN McKAY

IN view of the great development of the Canadian fisheries as a whole, it is extraordinary that the Maritime Provinces, which have at their sea gates the greatest fisheries in the world, should not have materially increased the volume of their catch for over a generation. And it is not surprising that William Duff, M.P., Mayor of Lunenburg, the Grimsby of Canada, should have at the last session of Parliament called upon the Government to institute an investigation into the whole question of the fisheries with a view to working out a policy which would lead to a greater development of our Atlantic fisheries. Unfortunately Mr. Duff's resolution was shelved by the pressure of other affairs, and the problem of formulating a vigorous policy for the development of these fisheries did not receive the public attention its importance deserved. At the same time Mr. Duff's exposition of the need of a new fisheries' policy was not in vain, and Hon. Mr. Ballantyne has undertaken a reorganization of the Dominion Fisheries Department, which promises good results in the near future.

While the capital invested in Canadian fisheries and the annual value of their product have both increased three times in the last twenty years, the quantity of fish caught by the Maritime Provinces has remained practically stationary for over forty years. The big developments in the fishing industry have been in British Columbia and Ontario, these two provinces producing nearly two-thirds of the annual fish harvest of $60,000,000. Of course the fish catch of the Maritime Provinces has a greater value now than it had twenty or forty years ago, but this, as Ward Fisher, Chief Fisheries Officer for Eastern Canada, admits, is due to the increase in prices, not to the quantity caught.

Effect of Reciprocity

Some writers argue that Maritime fishing enterprise was arrested by the abrogation of the old reciprocity treaty with the United States, which allowed the fishermen reciprocal privileges in the ports of either country, and even permitted American fishermen to take fish in our territorial waters. Whatever may be the validity of that argument, it attracted little attention in the Maritimes during the reciprocity campaign of 1911, and since the United States opened her markets freely to Canadian fish some years ago, leading fish merchants say the effects upon their trade have scarcely been appreciable. In any case the American duty on fish was never high, and lobsters have always enjoyed a free market there.

The explanation of the comparative stagnation in the development of the Maritime fisheries lies in a whole series of causes unconnected with fiscal policies. When the development was arrested, the Maritimes were salting and drying practically all their fish catch. New England also had at that time a great fleet of Grand Bankers which salted and dried their catches. And if this branch of the Maritime fishing industry has remained nearly stationary, that of New England has greatly declined, and to-day the New England salt fish fleet is insignificant.

When the fresh fish business began to develop, the Maritimes were not in a position to compete with the New England fishermen in the American market, even if they had had free entry for their fish. American vessels were able to supply the fresh fish market in the United States about as fast as it could be developed, and, if Canadians had attempted to deliver large catches of fresh fish at Boston or Gloucester, they would probably have had to take lower prices than they were able to obtain for salt-cured fish in other markets.

World Conditions

No doubt the general development of the Maritime fishing industry has been limited by world conditions. The immense expansion of European fisheries during the past generation has restricted the profitable markets everywhere. European countries have been sending fish to the United States, the West Indies and South America, and, though Canada has increased her exports of fish, the margin of profitable development in the face of foreign competition has been small. The Maritimes were necessarily slow about developing the fresh fish business with the interior of Canada, because it is only in recent years that there has been anything like adequate transportation facilities. And while they were still working on the transportation problem, they experienced the formidable competition arising from the rapid expansion of the fresh fisheries of British Columbia and the Great Lakes.

Methods Have Been Slow

Moreover, it must be said that the Maritimes have not been noted for their enterprise in employing new methods of catching fish or preparing fish for the market. For a long time the fishing vessel owner was usually a general merchant, and by means of the truck system he kept his fishermen in a state of vassalage; the result being that many of the best fishermen went to New England. Possibly this condition was more or less necessary; the merchant who fitted out a fishing vessel might be a year before he sold the catch, and he usually had no surplus capital or credit to pay off his fishermen at the conclusion of a trip. Besides, as the fishermen worked on shares, a final settlement could not be made till the whole catch was sold. Only in recent years, or since the appearance of a number of large companies in the industry, has the truck system been generally abandoned.

Capital Backward

Capital for the development of the fisheries has not been readily forthcoming. Maritime business men have invested largely in wildcat mining schemes, western lands and fox ranches—on the principle no doubt that distance lends enchantment to the view—and they have overlooked the opportunities that lay at their doors. One county, however, has continued to show an aptitude for sea adventure worthy of the traditions of the Maritimes. Lunenburg County, by the application of the co-operative principle,—business men joining with the working fishermen in building and fitting out fishing vessels,—has built up a large fleet of Grand Bankers, handsome craft of yacht-like lines which could easily run away from the cup racers racing for market in a gale of wind. Its local enterprise has made Lunenburg County the greatest fishing community in Canada and brought prosperity to its two chief ports, Lunenburg and Lahave. Its example has inspired other communities

to adopt the principle of co-operation, but none have achieved results so satisfactory.

Large Companies Needed

It would seem that the Maritime fishing industry has reached a stage of development where large companies, disposing of considerable capital, are required for its further expansion. Time was when the fishing business was a good deal of a gamble; but it is now in process of being what the French call industrialized—of being reorganized as a big business on the lines of the meat-packing industry. A number of large corporations have appeared on the scene, and are doing good work. They have put up big plants where fish are assembled from entrails—everything that was formerly thrown overboard. One of the by-products is fish oil, which has many uses and can now be rectified and rendered clear and odorless, so that it forms an excellent base for margerine. After the extraction of oil, a fine quality of glue is obtained, and the residue of the fish waste is ground and cooked, becoming fish meal, which is in growing demand for feeding hogs, cattle and poultry. In the United States they are now experimenting with the idea of making leather from the skins of a variety of fish besides porpoise and sharks.

Cured Product Inferior

The companies which operate modern plants for salt curing or packing fish Government stamp on packages containing fish products conforming to the proposed standards. This inspection system may work out all right in the case of large companies which employ experts to cure and pack their products, but it seems to overlook the fact that a large number of people employed in curing and packing fish have no special technical training for their work, and in the present condition of the industry generally it is rather looked upon in some quarters as a move on the part of the big companies to acquire a preference for their products.

Standardizing fish products—and this term does not preclude recognition of the fact that different standards are required for different markets—is not so

Canning Fish in a Modern Cannery

wide area, and treated and cured by xperts using modern processes; they aintain cold storage depots on the coast nd are endeavoring to build up an effi- ent refrigerator transport service,—a ig problem in a country like Canada; nd they are developing stable markets n communities where sea fish were pre- iously unknown, at any rate in a fresh ate.

These companies are also eliminating te waste which went on under the old gime. It is calculated that some years o one-third of the possible value of the h catch was lost. Where a by-products ant is not accessible a modern beam awler throws overboard fish with a tential value of half a million dollars ery year. Now a few, a very few, aritime plants operate reduction works hich utilize the heads, bones, skins, in various forms only handle a small proportion of the catch, and they are handicapped by the fact that Canadian cured fish do not enjoy the best of reputations in either the home or foreign markets. "Canada produces just as good fish in the raw state as any other country," says H. B. Short, of the Maritime Fish Corporation, "but the fact remains that in many cases our cured product does not compare favorably with the finished products of some other countries, nor command the same prices."

Standardizing the Pack.

The Canadian Fisheries Association has been working on the problem of standardizing the pack, and at its instance the Dominion Department of Fisheries has undertaken to establish a system of inspection, providing for the placing of a simple a matter as, for instance, grading and packing apples, so as to pass the Government inspection. A preliminary to the satisfactory operation of a Government system of inspecting and branding of the fish pack would seem to be provision for the technical training of those employed in curing and packing the product. But the question of establishing technical training schools for those employed in the fishing industry, such as they have in European countries, has not got beyond the stage of discussion in the Maritimes. The Dominion Government has offered grants for such schools, if the industry itself will do its part, but it seems likely that the Maritimes will be left behind by British Columbia in the establishment of institutions which by general admission are essential

for the proper development of the fisheries.

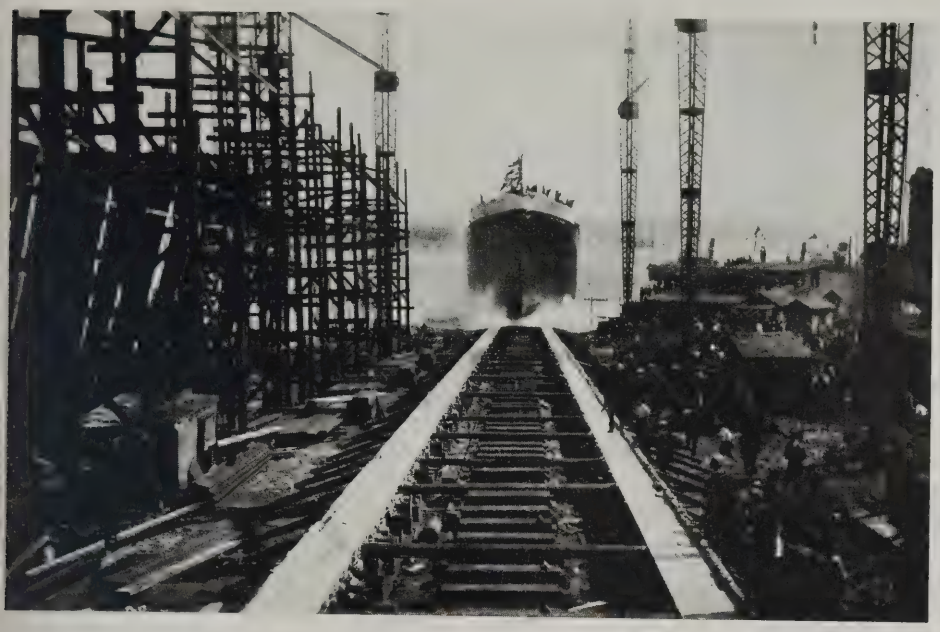
While the big companies have done a good deal to improve the methods of curing and marketing fish, they have not yet given much attention to the problem of production. Sailing craft are mostly employed in the deep sea fishing. They anchor on the banks or move about under shortened sail, while the men go out in small dories and set what is erroneously called trawls—lines a mile or more long with short lines every few fathoms bearing baited hooks. The work is hard and dangerous, and when fogs or snowstorms shut down suddenly the men in the little dories are sometimes lost. The shore fishing is carried on by small boats, usually equipped with motor engine, and at present the shore fishing is far more important than the deep sea fishing. In the Maritime Provinces and Quebec about 25,000 fishermen work in small boats, as compared with about 5,500 working in vessels, ranging all the way from 15 to 125 tons register.

The steam vessel, using a beam or ottar trawl,—a large scoop net which is towed through the sea, catching all kinds of fish,—is the most efficient method of fishing by far. Before the war 95 per cent. of the total catch of England and Wales was captured by steam trawlers. But the Maritimes have only a few of these craft, and the United States less than fifty, most of which have been built in the last three years. When the beam trawlers first began operations off the coast of Nova Scotia, the fishermen objected strongly to their employment, claiming that they would soon ruin the fisheries; a claim that was made years ago by the North Sea fishermen. At first their operations off the Canadian coast were not attended with success, and the Maritime and New England fishermen regarded the new invasion with complacent scorn with which conservatism looks upon new-fangled inventions. But the French fishermen soon demonstrated that beam trawlers could be employed as successfully in western waters as in the North Sea, and with a little experience the Nova Scotia and New England beam trawlers began to make catches that surprised the old fishermen.

In time the beam trawlers, operated by steam or motor, will doubtless supersede the type of sailing craft now mainly employed in the deep sea fishing, but lack of capital is retarding their introduction—more perhaps than the lack of trained crews. At any rate, it is no longer difficult to get native fishermen to man them. Operating these craft is less arduous or hazardous, compared with fishing from dories, and the earnings of their crews sometimes run to $300 or $400 a month per man. Naturally the prejudice against them is dying out, and little is now heard of the pretension that they will ruin the fishing on the 69,550 square miles of fishing banks within easy reach of Maritime ports, to say nothing of the extensive fishing grounds in the Gulf of St. Lawrence and off the coast of Labrador.

But the question of increasing the production of fish is not at present so important as that of developing larger markets, and this, with the rapid extension of Canada's ocean services by the Government Merchant Marine and the general improvement of rail transport, is becoming largely a problem of improving the quality of the product and establishing a better reputation for Canadian fish. Apart from the opportunities offered by overseas markets, it would seem that the possibilities of the Canadian and the American markets have only been scratched. Neither Canada nor the United States are large consumers of fish, compared with England and other European countries. A Canadian official tells us that the per capita consumption of fish in Great Britain is 55 pounds per annum, as compared with only 20 pounds in Canada, while an American official affirms that England consumes 60 pounds per capita, Canada 40 pounds and the United States 20 pounds. In any case there would appear to be a big possibility of encouraging the consumption of fish both in Canada and the United States, a problem which might be dealt with, after the German fashion, by a systematic campaign of publicity and demonstration designed to popularize fish as an article of diet.

Telephone Rate Increase Hearing at Ottawa



ON September 21-23, the Board of Railway Commissioners held a hearing at Ottawa in connection with the application of the Bell Telephone Co., of Canada, for an increase of rates. The Association was represented by J. E. Walsh, general manager, and S. B. Brown, assistant manager of the Transportation Department.

In their application, the company requested an advance in flat rate charges for both residence and business telephones in all cities except Toronto, Montreal, Hamilton, Ottawa and Quebec. At these points an increase was requested in the flat rate charges on residence and business phones, but in the case of the latter this would be subject to a maximum allowance of 100 calls per month, with extra charge, above that number, of 4 cents per call in Toronto and Montreal and three cents per call in Ottawa, Hamilton and Quebec.

Various reductions were proposed in the rental of private branch exchange equipment. For example, extension lines would be reduced to $10.80 per annum, the generator circuit would be supplied free and the rental of the switchboard would be reduced. An entirely new system was proposed in the long-distance service, a higher charge being assessed on what are known as person-to-person calls as distinguished from station-to-station calls. An increase in the regular rate for long-distance calls was also requested.

The Telephone Company in support of their request for these various increases, which they alleged would bring them in the neighborhood of $5,000,000 increase in revenue, stated that they must be in a position to secure additional capital through the issuance of securities amounting to $10,000,000 per annum, and that they must be in a position to pay 8 per cent. for this money; otherwise, the could not issue the securities as the market would not absorb them. In support of this contention they submitted several witnesses, representing financial houses, to show first, the necessity of an increase in the revenue of the Bell Telephone Company before it could properly issue further securities, and, second, that the prevailing rate for money was in the neighborhood of 8 per cent., and that there was no immediate prospect of a reduction in this rate.

Witnesses were also put forward to show the condition of the plant at the present time. The plant superintendent alleged the situation in that regard was very unsatisfactory, in other words, that owing to high cost of materials, shortage of labor and capital, they had been compelled to withhold certain extensions and improvements, which had had the effect of placing the plant below normal and inadequate to properly handle the service. Mr. Lash, the chief engineer, went into these questions quite extensively, and showed the necessary requirements of the Telephone Company in the way of extensions and new equipment which would be absolutely necessary in order that they might take care of the present and prospective business of the company.

The first steel steamer built by the Halifax Shipyards, Limited, takes to the water.

First Steel Ship for Halifax

Historic Occasion When "Canadian Mariner" is Successfully Launched at Halifax Shipyards

An event of no small importance in the industrial life of Canada occurred on Saturday, September 4, when the first steel steamship built by the Halifax Shipyards, Limited, was successfully launched. The occasion was a gala one for Halifax, the launching being attended by thousands of citizens, who thronged all the approaches to the shipyards to do honor to an historic occasion in their city's life.

The launching took place at 11.30 in the presence of the Lieutenant-Governor and Premier of Nova Scotia; Alexander Johnstone, Deputy Minister of Marine; Mayor Parker of Halifax; Roy M. Wolvin, President, Dominion Steel Corporation; H. B. Smith, president Halifax Shipyards, Limited, and many other distinguished people. The christening ceremony was performed by Mrs. Wolvin, who named the ship the *Canadian Mariner*.

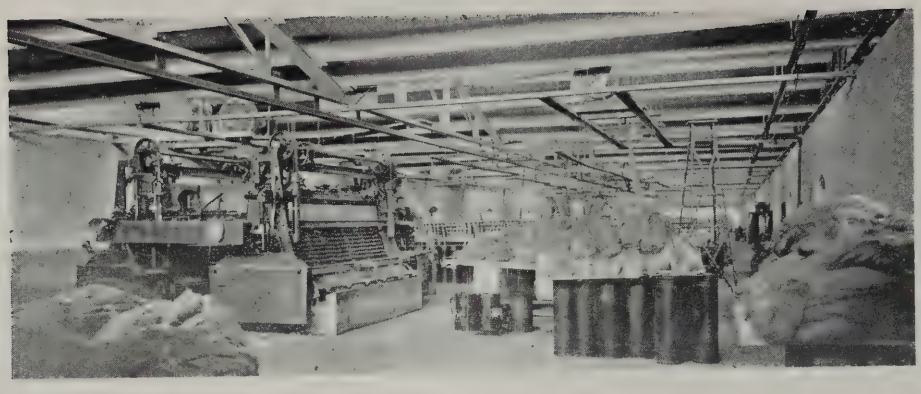
Subsequently a luncheon was served in one of the large office buildings. President H. B. Smith presided, and in a few opening words emphasized the importance of the occasion to Halifax and Nova Scotia. The *Canadian Mariner* was the largest vessel ever built in the province; it was built entirely of steel, built by Canadian workmen and registered the highest class known to the shipbuilding world. Congratulatory speeches were then delivered by Roy M. Wolvin, Alexander Johnstone, Lieutenant-Governor Grant, Premier Murray, Mayor Parker, G. Fred Pearson, J. F. McLurg, general manager, and J. F. Paige, operating manager.

The keel of the *Canadian Mariner* was laid last October. The bitter weather of the succeeding winter delayed operations, but with the coming of spring the work proceeded rapidly. June 21 was set as the day for the launching, but a strike intervened and it was necessary to postpone the event. With the restoration of industrial peace, the work of construction was speeded up and the shipyards' staff did wonderful things during August.

Description of Ship.

The *Canadian Mariner* will be a two-deck freighter, with a speed of 11 knots. She is built under Lloyds regulations. Her specifications are as follows:

Canadian Mariner



8,100 Tons D. W.

Length over all—413 ft. 1 in.
Length between perpendiculars—400 ft.
Breadth, moulded—52 ft.
Depth, moulded—31 ft.
Draft, loaded—25 ft. 1 in.
Type—2 d., p.b. and F'c's'le.
Engines, type—Triple Expansion.
  Cylinders, diam.—24 x 44 x 73 ins.
  Stroke—48 ins.
  Ind. H.P.—3,000.
Boilers, type—Single Ended.
  Number—3.
  Diam. and length—15½ x 11½.
  Working pressure—180 lbs.
Furnaces, number—9.
  Grate surface—198 sq. ft.
  Heating surface—7,743 sq. ft.
Speed—11 knots.
Classification—Lloyds.

Notable People Present at the Launching

In the centre stands Mrs. Roy Wolvin, who performed the christening ceremony; to her right is Mr. H. B. Smith, President of Halifax Shipyards, Limited, and to her left the Admiral of the Port; Roy Wolvin, Vice-president, and J. F. McLurg, General Manager of the Company.

General View of Flax-Spinning Room

Developing a Canadian Linen Industry

Production and Manufacture of Flax Fibre in Canada—Prospects for a Linen Industry—Quality of the Linen Already Made in Canada—History of Canadian Linen—Manufacturing Processes—Markets Available

By JOHN LANIGAN

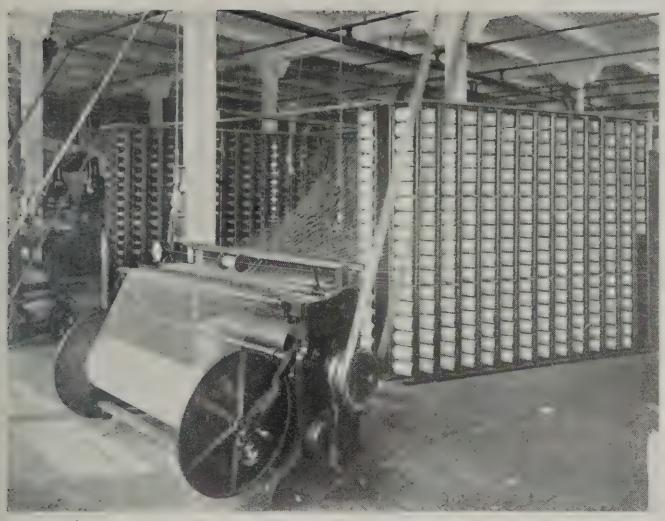
TWO Canadian industries which owe their remarkable growth directly to the war are the spinning of flax and the manufacture of linen. Before the imperative cry for increased production was raised these industries were hardly considered as an important part of Canada's wealth. Now they have grown so as to deserve that consideration, and their possibilities for further growth are almost unlimited.

As the Canadian linen industry is necessarily linked with the production of flax* and the spinning of linen yarns, a few words about the agricultural and earlier mechanical processes may have some value as an introduction to the wider subject. These processes have reached a high degree of efficiency, while the linen industry proper is still in its infancy.

In 1914 there were 4,000 acres of flax land in Ontario. According to the flax specialist of the Dominion Government the acreage of land utilized in the production of fibre flax is now 40,000, or almost double last year's acreage. As stated above, this rapid increase is primarily due to the war. Before the war, the world production of flax fibre was 500,000 tons, of which quantity Russia produced about 80 per cent. Blockades in the early part of the war, and the default of Russia later on practically cancelled the supply of the portion usually exported from there. At the same time a great demand for linen existed; aeroplane wings had to be covered with linen, linen threads were needed for uniforms, boots, etc. Hospitals required a continual supply of linen goods.

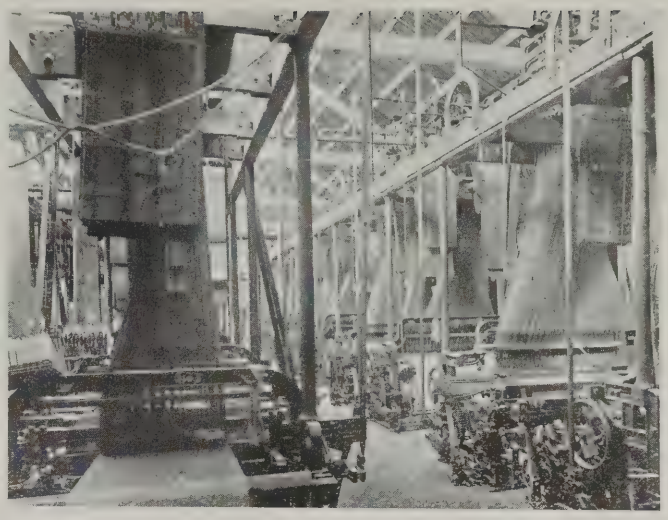
Faced with the prospect of a failure in the shipments of raw material, while the demand for the manufactured product was ever becoming more insistent, the British Government issued to all parts of the Empire an appeal to grow flax. One response to this appeal was the increased acreage of flax-growing land in Canada. By an Order-in-Council dated October 23rd, 1918, all seed of fibre variety was commandeered and shipped to Ireland. The amount of seed sent under this order was 110,000 bushels, which fetched a price of $27.50 per sack of 182 pounds.

In this connection, a recently published report of J. Vernon McKenzie, Canadian Government Trade Commissioner at Glasgow, contains some facts of importance. "Canadian fibre flax seed," he writes, "has within the past few years gained many friends amongst the merchants, growers, and the technical Governmental agricultural authorities in Dublin. In 1918 the Governmental figures showing direct trade between Canadian ports and Ireland do not differentiate between fibre seed and linseed, but it is stated that the great bulk consisted of the former variety; the value of the trade was £91,520. In 1919 the flax-seed exportation (direct) from Canada to Ireland had grown almost fourfold, totalling £339,289."



Mr. McKenzie also refers to the necessity for careful inspecting and grading. If seed other than government inspected and graded No. 1 is allowed to be exported disastrous results will follow. The Irish Department of Agriculture is circularizing growers and importers to impress upon them the value of the Canadian Government certificate.

Canadian flax is also appreciated in Ireland. Most of our crop is now exported there and later returns to Canada manufactured into the finest Irish linen. Prospective linen manufacturers need not worry about either the quantity or quality of their raw material. This year's crop is very good. It is estimated that the yield and quality of the flax straw is 26 per cent. higher per acre than that of the 1919 crop. There are now seventy-seven flax mills operating in Canada, and all machinery for extraction of seed and fibre is now made in this country.



The growth of the flax industry has not been unattended by difficulties. One of the chief of these was a prejudice amongst farmers against this particular cereal. The belief was widespread that flax had an injurious effect on the soil. Like most beliefs of the kind there was a certain amount of reason behind it. Flax seed in the past had been supplied to farmers when it had not been properly screened. As a result, when it was sown a goodly crop of weeds was sown at the same time. Mr. S. F. Glass, M.P. for East Middlesex, who has done much to assist and stimulate the flax industry in Ontario, brought this matter before the House of Commons in April, 1919. In the course of a speech on the industry he said:—

"I desire to bring to the attention of the Minister and of the Department of Agriculture the very great importance if we are to develop this industry on a broad and successful basis, of the closest care and jealous scrutiny and protection

*Unless otherwise stated, the word flax where used in this article refers to fibre flax, most of which is grown in Ontario.

Warping Machine in Linen Mill

Weaving Room in Linen Mill

of our standards of seeds. We must also have the confidence of our farmers, and we must disabuse their minds of the prejudice that still exists that flax seed is dirty for the land, that it takes away from the soil essential properties. These prejudices are easily tested by an examination of the reports of agricultural farms in this country, in the United States and in England, and there would seem to be no reason why these prejudices should continue to exist."

The difficulty just mentioned is now being counteracted to a great degree. Another difficulty, harder of solution, has not been finally settled. That is the question of labor. Flax must be pulled, as the fibres run down to the roots, and the length of fibre is one of the main considerations in determining its value. Now, pulling flax is not the kind of job that a rational person would choose when any other form of employment was open. Consequently, white labor is almost impossible to obtain, and growers depend largely upon Indians for gathering the crop. While there is an incidental advantage to the country in this, since people who are otherwise of little economic importance are given work, the condition is unsatisfactory to those directly concerned. Indians are wards of the Crown, and as such not subject to the ordinary laws of contract. They are extremely unreliable, and constant supervision of their work is necessary. Some relief in this direction may be expected when the flax can be pulled by a machine, but so far the machines tested have not come up to requirements. Moreover, any machine that pulls flax will also pull weeds.

Again, like all industries dependent on agriculture for their raw material, the flax business is at the mercy of the weather. There are good years, when the fibre is long and the crop plentiful, and bad years when the grower gets a scanty and stunted harvest. In the "dew-retting" process, where the flax is spread out in fields until fermentation and decay have loosened the fibre from the pith, too much rain will discolor or weaken the fibre. If the flax is not gathered and dried at the proper time, most of the preceding work is wasted.

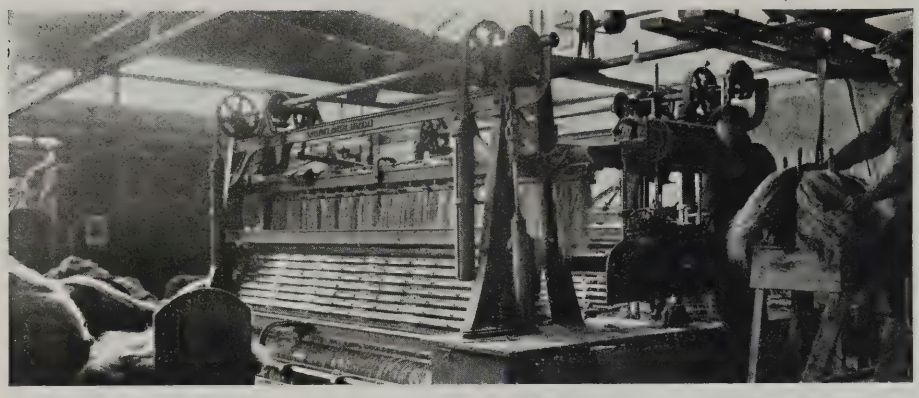
The Linen Industry.

In spite of difficulties such as these, the production of raw material proceeds, and the yearly quantity is increasing. What is being done with it? The Irish linen mills receive the greater proportion of the most valuable fibre, since the facilities for taking it up do not exist in Canada. There is linen being made in Canada, by Dominion Linens, Limited, but their mills are supplied and kept running to capacity by flax grown on their own land, an area of 700 acres. To utilize the rest of the flax, more mills are needed.

What are the prospects for a linen industry in Canada? Provided someone has the initiative and the capital to establish mills, there are great possibilities for success. Mr. J. H. Campbell, president of Canadian Flax Mills, Limited, is of the opinion that linen can be manufactured profitably in Canada. "We send our fibre to Ireland now," he said, "but we would rather sell it in Canada, if there were mills here to take it. I am sure that good linen can be made here. The folly of exporting raw material when we might export the manufactured article has been clearly established. The manufacture of Canadian linen from Canadian flax should be encouraged in every way, even by Government assistance if it should be required."

"How does the linen made in your mills compare with that imported from England and Ireland?"

This question was addressed by the writer to Mr. W. Berry, vice-president and manager of Dominion Linens, Limited, on completing a tour of the Guelph plant. Any doubts implied by the question were completely dispelled by the reply. Mr. Berry turned to the shelves of the shipping-room, took down a number of boxes and displayed their contents, table-cloths and serviettes.



"Look at these," he said, "have you ever seen anything better in imported goods? Here in Guelph we are making linen superior to anything turned out by firms in the Old Country. Even the 'Old Bleach' Irish linen cannot equal this for whiteness."

Even a layman could appreciate the quality of these goods. The delicate woven designs, the combination of whiteness, sheen and texture that constitutes the finest damask were there. Here lay a further proof that what can be done by other industrial nations can be done in Canada.

History of Canadian Linen.

The production of fine linens is a modern development of Canadian textile manufacture, but the linen industry has a long history behind it. The earliest settlers spun their own flax; in fact on some Quebec farms the habitants still use homespun linen, and very good stuff it is. As for mechanical production, Canadian mills have been making coarse linens for the past seventy years. For about fifty years Doon Twines, Limited, have been spinning Canadian flax in their mills in Doon and Kitchener, making twines and cordage.

The manufacture of fine linens in Canada may be said to date from 1903, when the Brantford Linen Company was formed. In 1908 this company moved to Tillsonburg, and the name was changed to the Oxford Linen Company. In 1914, shortly

A Flax-Hackling Machine

after the Dominion Linen Manufacturing Company had been established in Guelph, an amalgamation of the Guelph and Tillsonburg plants was made under the name of Dominion Linens, Limited. Flax Spinners, Limited, are a subsidiary of the linen company. Since the formation of Dominion Linens, the Tillsonburg plant has been used for the production of heavy towelling, while at Guelph both coarse and fine grades of linen are manufactured.

Manufacturing Processes.

"From flax to fabric" is a slogan of Dominion Linens—a concise statement of the important fact that they are a self-contained industry. The flax used is grown on the company's land, an area of 700 acres. At present it is pulled by hand, Mexican and Indian labor being used for the most part. The perfection of a flax-pulling machine will doubtless cut down a heavy item of expense here. The flax is threshed and retted. In Ireland dew-retting is the favored process. This is also used in Canada, but the company have found that for the finer grades of linen tank-retting gives the best results. A number of concrete tanks have been built for this purpose, while during the summer months the temperature is frequently the right degrees for the river to be utilized. When thoroughly retted, the flax is "scutched," the fibre is stripped from the "shive" or pith by machinery. The next process is "roughing" when the fibres are combed by hand to separate the short fibres from the long ones used in better yarns. The short fibres are spun into tow.

From that point on all the processes are mechanical. The hackling machine combs out the fibre by a series of combs graded in fineness from three teeth to a foot to fifteen to an inch. Further combing and straightening of the fibres take place in other machines till a thin even ribbon is formed ready for spinning. The spinning machine then takes this ribbon and spins it into a light yarn or thread, winding it on spools as it is spun. The coarser yarns are used for linen thread, shoe thread, twine, etc. The finer are sent to the linen mill for weaving. In the linen mill the yarns are wound on cylinders to form the web and on small "pirns" which go in the shuttles. The fabric is then woven in a power loom, the pattern being worked in by an automatic control of the shuttles. It is then bleached by a process of boiling and washing with chemicals. When dried it is "beetled," i.e. pounded on rollers for a period of from three to six days by a battery of wooden mallets. Hydraulic mangles iron the linen, other machines calendar and fold it, and finally it is hemstitched, baled, stamped and packed for shipment.

The linen industry has to recommend it many general advantages which it shares with other industries, and some which are peculiar to itself. Among the former may be mentioned the close connection existing between an industry of this kind and agriculture. A factory which buys from the farmer is more popular with him than one from which he buys. Again, there is the reciprocal effect of one industry upon others. At the present time most of the machinery used in the manufacture of linen must be imported from the United Kingdom. With the growth of the industry it is probable that Canadian manufacturers will see a profit in making the machinery here, or else firms from England may find it advisable to locate branches in Canada. Either course will be for the good of the country.

Labor Conditions.

The higher processes in linen-making call for skilled labor. As the training required for these processes was not available in Canada, it was found necessary to draw on the British labor market. A desirable class of immigrants has thus been introduced into the country, and more will follow, attracted by higher wages and better living conditions than are open to them in Great Britain and Ireland. Moreover, these operators will form the nucleus of a new trade, and in time a new kind of skilled labor will be open to Canadian-born workers.

"We are not worrying about selling goods," said Mr. Berry. "The great difficulty is to keep up with our orders."

Dealers are finding out that Canadian-made linens are quite as easy to sell as imported ones. In fact with enough mills to supply the Canadian demand, there is no reason why a yard of linen should be imported. There is a market in Canada alone for about ten times as much linen as is now produced here.

In addition to the domestic market, there are great possibilities in the export field. There is very little linen manufactured in the United States, and none to compete in quality with the Canadian product. Two powerful rivals in export trade—Ireland and Belgium—are temporarily handicapped, the one by internal dissensions, the other by the effects of the war.

A necessity of war which, with the progress of commercial aviation, is becoming a necessity of peace-time is aeroplane linen. War contracts for this commodity were granted to Dominion Linens and satisfactorily filled. The demand for it will increase as the aeroplane business extends. Canada can supply this demand as well as any other country.

There is in the case of the linen industry no present need of urging people to buy Made-in-Canada goods. The industry is being well supported, and no difficulty in finding customers has been experienced. Dominion Linens makes towels and table linen for the Canadian railways, and are selling also to several department stores. The fact that there is a Canadian linen industry, is, however, unknown to a great many Canadians. Cases have been known where Canadian linen has been sold as Irish linen. It should be a matter of national pride to prevent such occurrences. Wider publicity should be given to all new industrial enterprises. An industry such as the one under discussion is a national asset. It attracts immigration and gives employment to Canadians. It provides the farmer with a convenient market for raw material. Finally when Canadians buy goods produced in this country their money goes to Canadian workmen; when they buy imported goods the only parts of the purchase price to remain in Canada are the tariff and the importer's profit and overhead expense. Every new industry will tend to keep Canadian money at home and rectify the adverse rates of exchange. For these reasons the development of a Canadian linen industry is desirable.

How Canada's Shoe Manufacturers Are Advertising Their Product

By J. L. CHARLESWORTH

THE average citizen of Canada, I do not believe, appreciates the quality of *Canadian-Made Footwear*. I think it is the duty of the shoe manufacturing industry to lay before the consuming public of this country the merits of our production. There is a tremendous amount of ignorance and prejudice in the minds of the people of this country with respect to the merits of *Canadian-Made Footwear* as compared with the imported article.

"The object of this advertising campaign, as I take it to be, would be to disabuse the minds of our people of the prejudice and ignorance that now exist. One can hardly expect other than false ideas to prevail among a large portion of our people when you consider the unfair and untrue criticisms that have been passing through part of the press during the past two or three years with regard to our particular industry."

When the Shoe Manufacturers Association of Canada held their first annual meeting at Quebec in January last, Mr. J. D. Palmer, president of the Hartt Boot and Shoe Company, and second vice-president of the Shoe Manufacturers Association, was the man chosen to set forth the plans and objects of the advertising campaign. The extract quoted is from his speech on that occasion. Standing before representatives of the shoe manufacturing industry from all parts of the Dominion, dominating them by voice and gesture, Mr. Palmer told what the advertising campaign was and why it was to be carried on. The cheers that greeted his words were not only a tribute to Mr. Palmer's efforts in the campaign but were an expression of faith in the idea which underlies it.

A Unique Campaign.

In one respect the campaign is unique. This is the first time that a group of Canadian manufacturers have associated in advertising their particular product, not with the immediate purpose of selling it, but to obtain justice from the court of public opinion. Naturally the manufacturers wish to sell their shoes, but in the present instance they have not made selling their chief purpose. Instead, they are showing buyers of footwear that it is their duty to buy shoes made in Canada and also that in doing so duty and interest coincide.

The first objective then is to prove that Canadian shoes are equal or superior in quality to any imported articles. Allied with this point is the fact that quality for quality, Canadian footwear is better value for the price than imported shoes. And further, when an industry exists on which 70,000 Canadians are directly dependent, then it is the duty of loyal citizens to support it by all means within their power.

The figure, 70,000, has been given here as a rough estimate of the number of people employed in shoe factories and their dependents. As a standard for judging the economic importance of this industry it is far too low. Allied with the shoe manufacturing business are numerous other enterprises. Tanners, leather merchants, shoe jobbers and all the trades who make machinery and furnish supplies for the making of shoes are affected in varying degrees by the conditions which affect the manufacture of the finished product. When the employees of these trades and their families are added to the 70,000 already mentioned, some idea of the national importance of the shoe industry proper may be formed.

The Second Objective.

The second objective is the rebuttal of unjust accusations made against the industry. The charge of profiteering is very often made in these days, and the shoe industry has not escaped. Manufacturers have been accused of fixing their prices just low enough to undersell imported articles, so taking the tariff as an additional profit. When this charge was made in a booklet issued by the Canadian Council of Agriculture, the Council was invited to appoint a committee to examine the plants of shoe manufacturers. Every facility was

The Brains Behind the Shoe Campaign

Left to Right:—C. L. Craigie, Ames-Holden-McCready, Limited; A. Marshall (secretary); J. D. Palmer, Hartt Boot and Shoe Company, (chairman); and R. N. Ashcroft, Ames-Holden-McCready, Limited. Three members of the committee were unable to be present when this photograph was taken. Photographs of two, J. E. Warrington and G. A. Blachford, are reproduced on another page, but it was unfortunately impossible to get one of A. Tetrault of the Tetrault Shoe Manufacturing Company, Limited, in time for publication.

offered for a thorough survey of the industry, books were to be open for inspection. The invitation was declined.

Similar charges have appeared from time to time in certain newspapers, and been reprinted without comment in others. The result has been that Canadians have received a very misleading impression of the industry, and in many quarters a feeling of actual hostility is apparent. If these charges are to be satisfactorily disproved and this hostility turned to friendship, publicity must be given to the facts.

History of the Scheme

In 1919 some prominent shoe manufacturers in the Maritime Provinces were discussing matters affecting their industry. The outlook was not promising. Internal conditions, such as the rising cost of materials and labor, added to the widespread prejudice in favor of imported footwear, made it look dark, not to say black.

"We're not getting a fair show," was the verdict, "the Canadian public is being told a choice collection of falsehoods about us."

"How can we stop it?" someone asked.

"By telling the public the truth about our industry. We have a good case, and people will admit it when they know the facts. Let's advertise!"

About the same time as the idea was taking hold in the East some manufacturers in Ontario were coming to the same conclusion. Letters were exchanged and conferences held. Finally a national committee was formed, with Mr. J. D. Palmer as chairman, to draw up a plan of campaign.

On the original advertising committee with J. D. Palmer were J. E. Warrington, of the John Ritchie Company, Limited, Quebec; J. Alfred Lambert, of J. Alfred Lambert, Inc., Montreal; C. L. Craigie, of Ames-Holden-McCready, Limited, Montreal; and George A. Blachford, of the Blachford Manufacturing Company, Limited, Toronto. Some time after the formation of the committee Mr. Lambert was appointed to a commission which was to draft a constitution for the city of Montreal and, on account of the heavy duties he had to perform on that body, he withdrew from the advertising committee. In his place Alfred Tetrault, of the Tetrault Shoe Manufacturing Company, Limited, Montreal, was elected.

A Logical Argument

Loyal Canadians are requested to give their support to fellow-citizens engaged in a national industry.

R. N. Ashcroft became a member of the Ames-Holden-McCready organization, and owing to his wide experience in advertising matters he was elected to the committee as an additional member. Alex. Marshall, secretary of the Ontario Shoe Manufacturers Association and manager of the C.M.A's. Commercial Intelligence Department, has also done valuable work as secretary of the committee.

Often enough when a society decides to do something the matter is handed over to a committee, and the other members promptly forget the matter. In the shoe manufacturers' advertising much of the success has been due to the enthusiasm of all members of the Association. The committee, representative of practically all localities in Canada where shoes are made, and of all lines manufactured, has been a unit on methods, copy and plans. But, while it members have directed the work, other members of the Association have done their share, sending in suggestions and interesting themselves in the copy. The co-operation and financial support of the allied trades should also be mentioned. Makers of lasts and linings, shoe jobbers, tanners, leather merchants, in fact all those industries which derive their livelihood in whole or part from the shoe trade have realized that their interests were identical with those of the shoe manufacturers, and have lent their best efforts to make the campaign successful.

When the outlines of the scheme were fixed the first annual meeting of the Association was held, and Mr. Palmer delivered the address to which reference has been made before. With the formal blessing of the Association on their efforts the committee proceeded to make final arrangements and fill in the outlines. On September 1st the six weeks of intensive advertising started.

Advertising has almost become an exact science and as such requires specialists. The best advertising brains in the country have been called into consultation with the Association's committee. The best methods for reaching the public have been discussed. Ways of ensuring the co-operation of retailers have been studied. The committee has aimed at perfection in every detail.

"How can we bring the case for Canadian-made footwear to every shoe buyer

in Canada?" has been the guiding question. First, there are the daily newspapers; almost everyone in Canada reads at least one of them. Then there are the farm papers, with a large circulation among people whom it is most important to influence. Then there are weekly papers, trade and class publications, monthly, fortnightly and weekly magazines. The advertising is appearing in all these different classes of publications, which have a total circulation of over 3,000,000. There will be a certain amount of duplication, but that only serves to make a stronger impression. It is better that every one should see the same advertisement twice than that a few should see it once.

The Moving Picture.

Another advertising medium is the movies. Six copies of an educational film are going the rounds of the moving picture theatres. It shows the principal processes in the manufacture of leather and shoes from the steer's back to the human foot. Almost every one goes to the movies some time or other, and many are more effectively reached by a picture than by a printed advertisement. Even if the film does no more than teach the admirer of Theda Bara that a vamp is part of a shoe, something will have been accomplished.

Finally, there is the co-operation of retailers and the public. All along circulars and booklets have been sent out to the 11,000 shoe stores in the country. In this way dealers have been kept fully informed of all details as to the nature of the campaign. Copies of the advertisements to appear have been sent to them, and special advertisements have been prepared which they can run in local papers over their own signatures. Colored display signs and small window signs have been provided for use during the campaign. To secure the interest of the clerks a contest is being held. In each province a prize of twenty-five dollars is offered for the best essay on the subject of "How I Sell Made-in-Canada Shoes," while to the writer of the best of the nine prize-winning essays a further prize of one hundred dollars will be awarded.

Essay Contests

Another essay contest is also being held as a further stimulant to the general public's interest. This is open to all school children of Canada of sixteen and under, and the subject is "Why You Should Buy Canadian-Made Shoes." In each of the nine provinces ten prizes of two dollars each will be given, and an additional ten prizes of two dollars each will be given to those children who write in French. It is certain that wherever a child is writing for this contest his adult relatives are going to talk about the arguments for Canadian-made footwear.

There are some people who do not read advertisements. To catch their attention "readers" are being inserted in various Canadian publications. These give facts about the growth and development of the shoe industry, and tell why the advertising is being carried on. In all these ways the Canadian shoe industry is being kept prominently in the public eye.

Success of the Campaign

While this is being written the campaign is still in progress, and it is too early to estimate accurately how far it has been successful. One point has been gained, however. The Canadian people are taking notice of the advertisements. The retailers are co-operating, and entries for the essay contest are pouring in.

The whole task may not be accomplished by six weeks' advertising, but with that

An Appeal to National Pride

This advertisement of the Shoe Manufacturers Association is designed ts convert those people who underrate Canadian products.

J. E. Warrington
The John Ritchie Company, Limited

as a foundation the work that remains to be done will be easier. On this point Mr. Palmer said in his Quebec speech:—

"One season of this kind of advertising may not be sufficient—it may be necessary for us to carry on this work for several years or several seasons; but where we have the true facts concerning this matter so overwhelmingly in our favor, it is our duty and also our great privilege at this time to make these known to the Canadian consumer. I am quite satisfied that the present misapprehension that exists in the minds of a great many Canadians with regard to Canadian shoes as compared with foreign shoes would disappear if the true facts were known to them."

G. A. Blachford
The Blachford Manufacturing Co., Limited

The prospects of success are favorable In the first place the case of the shoe manufacturers is backed up by the truth. Secondly, the strategic time has been chosen for the campaign. At this time of year most people are buying boots and shoes. When they have had Canadian-made articles brought to their attention in every newspaper, and go to a shop that is making a Made-in-Canada display, they are reasonably certain to give Canadian shoes a trial. In the third place the excellent character of the advertising should bring proportionate results. Two sample advertisements are reproduced here. One is a direct appeal to support the 22,000 Canadians who are engaged in the manufacture of shoes. The other, "The Too Modest Canadian," is a challenge to the national intelligence and pride. It asks the man "who praises with enthusiastic tone every century but this, and every country but his own" why his fellow-citizens are not just as good workmen as any foreigners; and he must admit that there is no logical reason for refusing to buy or for belittling the quality of Canadian-made shoes.

The Shoe Manufacturers Association of Canada have set an example that other groups of manufacturers might well follow. So long as people are allowed to remain in ignorance of the quality of Canadian-made goods they will continue to buy those of which they hear the most, which in many cases are imported. When they are made to think they will cease to be apathetic, and may become strong partisans of the view to which they are converted. The general Made-in-Canada advertising serves a useful purpose, but people will respond more readily when something tangible is brought before them. And, when one group of manufacturers have accomplished their design, another group will find a similar task easier. For blazing the trail the thanks of all industries are due to the Shoe Manufacturers Association of Canada.

Proposed Increase in Express Rates of 40 Per Cent.

ON Sept. 2nd and 3rd in Toronto, F. H. Phippen, on behalf of the Express Traffic Association, submitted the case of the express companies for a general increase in their rates of 40 per cent. A number of the exhibits were filed by the Dominion and Canadian Express Companies, but up to the time of the adjournment the Canadian National Express Company had not filed any evidence, although it was intimated that possibly they might become a party to the application. The evidence submitted and statements filed were to some extent similar to the freight rates case. That is, the actual figures for certain periods of recent date were taken as a measure and a full year worked out therefrom.

The Dominion Express Company admitted that they wanted a return of somewhere near 15 per cent. to 20 per cent. on their capital, which is stated as $2,000,000. They also admitted that the application was in part to compensate them for the contemplated increase in freight rates. It is well known the Dominion Express Company's contract with the Canadian Pacific Railway is one and a half times the first-class freight rate so that any change in freight rates would necessarily be reflected in their expenses.

In connection with this feature it might be well to point out that Mr. Phippen laid great stress upon the fact that he considered the judgment of the Board, in the former express rates case, had established the reasonableness of the basis of payment between the express companies and the railroad companies as one and a half times the first-class freight rate.

Hearings are now being held throughout the West, principally for the purpose of hearing evidence. Cross examination and argument will take place in Ottawa possibly early in November.

On October 7th, the Cabinet handed down its judgment in the freight rates case. The main feature of the decision of the Government is that the new rates stand. Something may possibly be done to spread over a large period the higher rates that apply from now to January 1, 1921, but this is only a suggestion. The Government recommends an inquiry by the Board of Railway Commissioners with a view to the ultimate equalization of eastern and western rates. The order is referred back to be corrected in its findings "in such manner or to determine what are fair and reasonable rates without taking into account at all, for the time the order shall be in effect, the requirements of the Canadian National System."

News and Views of the Association

There will be found each month in this department a record of the various activities of the Canadian Manufacturers Association during the preceding month. The information is supplied to INDUSTRIAL CANADA officially, and all members of the Association are urged to acquire the habit of reading and checking over the contents of the department carefully in order to keep themselves posted on the work of the Association

More Changes in Association Offices

Owing to the rapid expansion in the work of the Association, it has been necessary to effect some changes in the arrangement of the offices at headquarters in Toronto. The insurance department (Willis Faber & Co., of Ontario, Limited), have vacated the suite of offices occupied by them on the fourteenth floor of the Bank of Hamilton Building, and are now occupying larger premises on the ground floor of the Board of Trade Building. The space hitherto occupied by them has been taken over by the General Manager and the Legal Department. Mr. Walsh now occupies the private office at the northwest corner of the fourteenth floor, with Mr. H. Macdonald, secretary, and Mr. H. Macdonnell, assistant secretary, of the Legal Department, in the private offices adjoining. Mr. Walsh's former office has been taken over by Mr. J. T. Stirrett, general secretary; Mr. J. M. McIntosh, manager of the Trade Section Department succeeds to Mr. Stirrett's office; Mr. J. R. K. Bristol, manager of the Tariff Department, takes Mr. McIntosh's former office, and Mr. S. B. Brown, assistant manager of the Transportation Department, has moved into Mr. Bristol's old office. These changes are the result of an increase in staff which has taken place in the last few months.

Two Travelling Secretaries Have Been Appointed

In line with the policy of the Association to make its services of more and more value to the membership at large, two travelling secretaries have been appointed, whose duties it will be to visit the members throughout the country and form a connecting link between them and the various departments at headquarters. Their appointment marks a forward step in the work of the Association which should prove to be of great advantage.

Louis Loranger has been assigned to the position of travelling secretary and assistant secretary for the Quebec Division, with headquarters in Montreal. Mr. Loranger is a veteran of the Great War, and is a son of Judge L. J. Loranger. He will divide his time and energies between the various important industrial centres of Quebec.

O. C. Pease, who has been appointed to a similar position for the Ontario Division, is also a war veteran. He is already well known to many manufacturers in Canada through his activities as Canadian agent for the Canadian Export Industries Exhibition held in London this spring. Prior to that Mr. Pease was Canadian representative of the Canadian Export Pioneer of London, with headquarters in Toronto. His experience fits him admirably for the new work he has undertaken.

Association Officials at Tariff Inquiry

The Association has been well represented at the hearings of the Tariff Commission in Western Canada. The president, Mr. J. S. McKinnon, went to Winnipeg to present in person the statement of the Association's case, which had been prepared for the occasion. He was accompanied by Mr. J. E. Walsh, general manager; Mr. J. T. Stirrett, general secretary, and Mr. J. R. K. Bristol, manager of the Tariff Department. Mr. McKinnon returned east immediately after submitting the statement; Mr. Walsh remained until the conclusion of the Winnipeg session; Messrs. Stirrett and Bristol proceeded further west to attend the other sessions of the Commission, and will be in close attendance on the proceedings until the inquiry is over.

At Winnipeg, Mr. D. J. Dyson, chairman of the Prairie Division, took an active part in presenting the manufacturers' case before the commission, and quite a large number of members of the Division's executive and members of the Association were present to support him. Mr. G. E. Carpenter, secretary of the Division, was of course active in organizing for the hearings.

At Vancouver, the Association's case was introduced by Mr. J. B. Thomson, chairman of the B.C. Division, and here again the Association's members on the coast took a prominent part in the proceedings. Mr. Hugh Dalton the B.C. secretary, was in charge of local organization.

Ontario Division Heard Safety Address

A forceful address on the safety movement in industry was delivered at a luncheon of the Ontario Division, held at the King Edward Hotel, Toronto, on September 22, by Mr. R. M. Little, Director of the Safety Institute of America, New York City. Mr. Little was introduced by Mr. W. C. Coulter, vice-chairman of the Division, who presided at the luncheon. There were three reasons why the industrial safety movement merited the support of manufacturers, declared Mr. Little. In the first place, it was economic. It tended to conserve life, reduce accidents and loss of time from accidents and promote greater efficiency in the factory. Attention to it meant an appreciable saving in dollars and cents. In the second place, it was humanitarian, aiming to reduce the pain and distress occasioned by accidents. In the third place it was ethical and right.

Tracing the history of the movement Mr. Little explained that several of the large industrial corporations in the United States had begun to introduce mechanical devices for lessening accidents many years ago and these had reduced the number of serious accidents but not the frequency of accidents. It was not until educational campaigns were started that results became apparent. The formation of safety councils, the employment of safety engineers, the holding of meetings, the distribution of literature, the inauguration of competitions, all these

were necessary to make the work effective and to-day wonderful results are being obtained.

Mr. Little dealt specifically with safety work in several industries and told how the spirit of emulation between factory and factory and department and department was bearing fruit. He referred to the picnics now being held by large industries at which the safety idea was never lost sight of. It was perhaps the one subject on which there could be no difference of opinion between employer and employee, and he believed that the formation of safety councils was a great step in the direction of establishing good relations between management and men. He concluded with an appeal to his hearers to get behind the safety movement.

A vote of thanks to Mr. Little was proposed by Mr. J. S. McKinnon, president of the Association, and seconded by Mr. P. W. Ellis.

Investigating Minimum Wages in Alberta

A series of public meetings has been held recently in Alberta by the advisory committee appointed by the provincial government to inquire into and determine what shall be the minimum wages paid in the province.

The committee consists of J. N. McLeod, chief factory inspector, who is chairman; H. Milton Martin, Edmonton, nominated by the Canadian Manufacturers' Association; J. A. Gaetz, Red Deer, nominated by the Retail Merchants' Association; Robert McCreath, Edmonton, and Walter Smitten, Calgary, nominated by the Trades and Labor Council. Mrs. Margaret Lewis, factory inspector, is secretary.

The inquiry opened in Medicine Hat, and meetings have also been held in Lethbridge, Calgary and Edmonton, the latter concluding on October 14.

The work of the committee explicitly is to investigate and determine what shall be paid as a minimum wage to any person under the age of eighteen years and to any female person to which the Factory Act applies, and also the number of hours per day per week during which any person shall be required to work in any place within the Act, and also to determine what number or proportion of the employees in any shop or factory, office or office building may be apprentices. At the close of its inquiry the committee is to present its recommendations to the Lieutenant-Governor-in-Council. The committee is empowered to enforce the attendance of witnesses, to examine them under oath, affirmation or otherwise, and to compel the production of such documents and things as may be necessary.

In connection with the inquiry a brief was prepared by the Prairie Division showing wherein the present Factories Act of Alberta is unfair to the manufacturers in that it imposes burdens and restrictions which do not govern in any other province in Canada and goes much further than anything proposed by organized labor either at the Canadian National Labor Conference or the International Labor Conference. An urgent plea was also made for uniform labor legislation.

New Elevator Regulations for Manitoba

A general meeting of members of the Winnipeg Branch of the Association were called for October 5 for the purpose of discussing the regulations drawn up by the Elevator Board for the operation of freight and passenger elevators. The members of the Board were expected to attend the meeting. Formerly the Elevator Act only applied to passenger elevators. Now it is proposed that all operators of freight elevators shall be licensed at a fee of 25 cents. It is also proposed that inspections of elevators shall be made only by the inspectors of the Board, in place of as at present by both insurance inspectors and inspectors of the bureau. Regulations are also provided for equipment and operation of freight as well as passenger elevators.

Association Represented at Meeting in Montreal

The Association was represented by Mayor Beaubien, of Outremont, at a meeting of various business organizations held on September 28, in the Board of Trade Building, Montreal, to consider plans for securing a new bridge across the St. Lawrence River. As a result of the meeting a representative committee was appointed, charged with the task of preparing evidence and facts with regard to the necessity of the construction of a bridge as soon as possible; to secure all the data possible with regard to the present situation and future needs and to present them to the Harbor Board, with a view to preparing a case to be ultimately submitted to the Government.

Mayor Beaubien argued that the Harbor Commission had power to build a new bridge, with an advance by the Dominion Government, interest to be paid from the income. He advocated immediate steps to impress upon the Harbor Commission the necessity of building a new bridge in this way, with two roadways, one for slow and the other for fast traffic, and accommodation for railway traffic, etc. Such a bridge would have to be about 175 feet wide, and would cost at present rates, about $10,000,000.

Power Situation in Ontario is Discussed

At a special meeting of the Ontario Division, held at the King Edward Hotel, Toronto, on Wednesday, September 22, the hydro-electric power situation came up for discussion. A summary of proceedings since the holding of the annual meeting of the Division on April 29 was presented by the secretary, H. Macdonald. It repeated the resolution on the subject passed at that date,—

"1. That the Hydro Commission be urged to leave no stone unturned to meet the pressing need that so many industries feel of larger and surer supply of power.

"2. That before new radial enterprises calling for the use of large quantities of power be entered upon, all existing contracts for power be fulfilled.

"3. That an appeal be made to the Ontario Government of a Royal Commission to investigate the whole power situation so that the industries of the Province may not be further impeded.

"4. That the Toronto Hydro Commission be urged to consider the advisability of establishing one or more auxiliary steam plants."

Position of the Commission.

The position of the Hydro-Electric Power Commission, as outlined to the deputation which waited upon it on May 4, was next referred to.

1. The Commission, unlike a private owner, has not a free hand in disposing of the power which it has for sale.

2. Shortage last winter was partly due to ice troubles experienced by the Canadian Niagara Power Company which supplies Hydro with 60,000 h.p.

3. Hydro Commission has done everything possible to secure maximum supply, for example:—

(a) September, 1915, secured 60,000 h.p. from the Canadian Niagara Company.

(b) Spring of 1917, acquired Ontario Power Company.

(c) Projected Chippewa - Queenston scheme to develop 275,000 h.p.

(d) Secured 10,000 h.p. from Cedar Rapids in Eastern Ontario.

4. 60,000 h.p. auxiliary steam plan project was already being investigated the chief difficulties being scarcity and dearness of coal, length of time required to complete, and high cost of power so generated.

5. Of new radial railways already taken over or to be taken over, the only one which would require Hydro power was the Toronto Eastern, which would be supplied, not from the Niagara system, but from Central Ontario System.

6. The Commission was endeavoring to secure privately-owned block of 20,000 h.p.

7. The opinion was expressed by the Commission that owing to the power situation, Ontario was not a good place at the present time for new industries to locate.

8. Individual manufacturers requiring further power for the immediate future must look out for themselves.

9. It was agreed that night shifts in large factories would help considerably to ease the situation next winter.

Recent Developments

Since the conference in May, the following developments have taken place,—

1. Steam plant project definitely abandoned for the following reasons:—
(a) Prohibitive cost,
(b) Before it could be finished, the Chippewa Canal scheme (Ont., 1921) will be delivering power.

2. Royal Commission appointed to investigate and report on the entire Hydro radial scheme, including incidentally its relation to the power needs of industry.

The following recommendations were finally submitted—

1. That the Government be urged to investigate the following possible sources of power and to remove any obstacles there might be to their full development.
(a) 25,000 h.p. additional which the Toronto Niagara Power Company are able to develop.
(b) 18,000 h.p. which the Toronto Niagara Co. are now exporting to the United States under contracts which expire in October, 1920.
(c) 30,000 h.p. by a steam plant now lying idle in Toronto.

2. That the Ontario Division do its utmost to secure the acceptance by the Government of the principle that the power needs of industry should be satisfied before any new radial railway enterprises involving the use of large amounts of power are embarked on.

Mr. Ellis' Explanation

Mr. P. W. Ellis, chairman of the Toronto Hydro-Electric Power Commission, was invited to address the meeting and explain just how matters stood with regard to the supply of power. In the course of a clear and convincing statement, he hade it plain that Sir Adam Beck and the Ontario Hydro-Electric Power Commission were doing all in their power to meet the difficulties confronting them. Tracing the history of power development at Niagara Falls, Mr. Ellis explained that, when the first power plants were built, no one had any conception of the way in which the demand for power would increase within a comparatively few years. It had exceeded all estimates and the war had greatly aggravated the situation.

Interruptions in power during the winter months were the result of conditions of wind and weather, over which the Commission could exercise no control. They were doing all that could humanly be done to prevent these stoppages and to minimize their effect, but until the Queenston-Chippewa system was completed, there would always be this difficulty. He urged his hearers to take steps to cope with power shortage this coming winter and to devise means whereby there would be as little interruption as possible to business.

Referring to the 25,000 h.p. additional which the Toronto Niagara Power Co. might possibly develop, Mr. Ellis said the question of the rights of this company to develop this extra power was now in the courts. He hinted that the negotiations by the Ontario Hydro-Electric Power Commission to secure this and other systems might be concluded favorably at any time, and in that event the additional power would soon be available. In the meantime he trusted that all their difficulties would be over in the fall of 1921, when power from the Queenston-Chippewa system should begin to be available.

Mr. Couzens' Proposals

H. H. Couzens, general manager of the Toronto Hydro-Electric System, who was also present, explained what could be done by manufacturers and consumers generally to conserve power during the winter months and intimated that an advertising campaign having this in view would shortly be undertaken.

A resolution thanking Sir Adam Beck, Mr. Ellis, Mr. Wright and Mr. Couzens for their courtesy towards the Association and assuring them of the confidence of the members in the Commission, and desire to co-operate with them in any policies they might devise to relieve the power shortage, was passed. Also a resolution continuing the special committee on hydro-electric power in office was approved.

Express on Acids, Inflammables, etc.

The Transportation Department has received a copy of regulations for the tansportation by express of acids, inflammables, oxidizing substances, samples of explosives, and so forth, issued by the Express Traffic Association of Canada, Montreal, effective on November 1st, 1920, in accordance with General Order of the Board of Railway Commissioners No. 296, dated May 15, 1920. Members who have occasion to ship by express any of the various articles listed in this tariff of regulations may secure a copy direct from C. N. Ham, Secretary, Express Traffic Association, 95 McGill Street, Montreal. The articles provided for are similar to those in the freight regulations.

Minimum Wage Board Nominees

Pursuant to the recommendation of the Executive Committee of the Ontario Division, a meeting of employers of female labor in the province was held in the Association's offices, Toronto, on September 16, for the purpose of nominating representatives on the new Ontario Minimum Wage Board. The chair was taken by I. J. H. Heath, Toronto Carpet Mfg. Co., Limited. It was explained by the secretary, H. Macdonald, that the Minister of Labor, Hon. Mr. Rollo, had requested the Association to name several possible representatives on the Board, which was to consist of five members. After some discussion of the measure itself and its purposes, it was decided to recommend as chairman of the board, Prof. J. W. Macmillan, of Victoria University, Toronto, who had previously acted as chairman of the Manitoba Minimum Wage Board. Other names recommended as members were those of W. H. Shapley, Sterling Actions & Keys; C. J. Macfarlane, Canadian General Electric Co.; R. A. Stapells, McElroy Mfg. Co.; Mrs. H. D. Warren, Mrs. J. R. Shaw, and Mrs. S. R. Parsons.

The Ontario Minimum Wage Act was to take effect on October 1. The main feature of the act is that the board—which is composed of five members, including two women—is, in case of complaint, to convoke a conference of representatives of the two sides, and appoint an independent chairman who will sit as a referee with no deciding vote of any kind. The chairman's function will be simply to try to bring the two sides together. In case of failure to reach a unanimous settlement, the chairman of the conference will forward to the board the majority report, the dissenting members having the right to make a separate minority report. Upon the receipt of the report or reports, the board may either itself fix a minimum wage or refer the matter back to the same or a new conference for further consideration. The important thing, of course, is that the board will interfere only if and when the conference or conferences fail to reach an agreement.

The Ontario Act, it should be noted, applies only to the wages of female workers, other than domestic servants and women employed on farms. It does not apply, as does the Manitoba Act, to hours and conditions of work, nor to male minors.

Tariff Department Bulletin

Important Announcements Regarding Tariff Matters Including Change in Regulations re Drawback Claims

ON September 29th the Tariff Department sent out a circular, No. 275, directing attention to the recent change in the Cutsoms regulations, effective December 31st next, relative to drawback claims covering exported goods. The Department of Customs states that no drawback claim submitted after the 31st of December next, as covering exported goods, will be approved for payment unless the claim is filed with the proper Customs officer within six months of the date of the last export entry covered by the claim; also, it is required that the claim shall only cover goods exported during the period of one year. Of course, there is no objection whatever to the claim covering a shorter period.

Firms engaged in export trade are particularly requested to note this change in the Customs regulations. Further copies of the circular may be obtained on request, as well as any other information relating to drawbacks, by application to the Tariff Department.

Drawback on Steel Bars Used in the Manufacture of Steel Sheets

New regulations established by order-in-council were issued by the Department of Customs on the 18th September (vide Memorandum 2418-B), providing for drawback of 99 per cent. of the duty paid on imported steel bars used, after the 31st of August, 1920, and before the 1st of August, 1921, in the manufacture of steel sheets number fourteen gauge and thinner.

Drawback on Silk Cloth in the Gum.

New Regulations established by order-in-council were issued by the Department of Customs on the 18th September, (vide Memorandum 2417-B), providing for a drawback of 50 per cent. on imported silk cloth in the gum, not boiled off or bleached, measuring not less than 20 inches in width, when dyed or finished in Canada, after the 31st of August, 1920, and before the end of the next session of Parliament.

Board of Customs' Decisions.

Dried prunes, unpitted, in hermetically sealed tin cans, when not containing sugar, syrup or other preservatives, declared to be dutiable under tariff item 99, at 2/3 cents per pound.

Declared that the term "metal glove fasteners" in tariff item 671 is held to apply only to metal fasteners manufactured expressly for use on gloves. Garment and all other metal fasteners are held not to be entitled to entry under tariff item 671. Importations under this item are free of duty.

Benzol and solvent Naphtha declared to be dutiable under tariff item 271, at 2½ cents per gollon.

Declared that 10 per cent iridium platinum in sheets is entitled to entry under tariff item 363 (free).

Declared that stone developing tanks and films for X-ray apparatus for use in hospitals are entitled to entry under tariff item 466 (free).

Declared that removable automobile tops, designed to convert automobiles of open types to automobiles of closed types are not subject to the excise tax of 15 per cent. In effect from May 19th, 1920.

Departmental Rulings.

Ruled that the quantity of imported spirits on which excise tax is paid is to be determined in the same manner and in the same quantity as that on which Customs duty is paid.

Material, per sample, from the Refining Company, Omaha, Neb., known as Refinite and invoiced as ground clay, ruled to be dutiable under tariff item 282, at 22½ per cent.

Excise Tax Rulings

The following corrections should be noted to the rulings set forth in the Association's circular No. 266, dated the 10th July.

The ruling on page 7 re sales tax on raw hides and wool sold by farmers and butchers is cancelled. The Department has now ruled that the sales tax is not applicable to raw hides purchased by tanners and dealers from farmers or butchers selling exclusively by retail. Nor does the sales tax apply to raw furs when sold by traders, or to raw hides and raw furs when sold by storekeepers who sell exclusively by retail, nor to wool when sold by the farmer or retail storekeeper.

The second paragraph on page 10 re sand and gravel should be corrected to conform to a recent ruling of the Department of Customs and Inland Revenue, which states that while the sales tax applies on all sand and gravel imported, it does not apply on domestic sand and gravel sold by the pit owner without processing or screening. The Department states that if the sand and gravel is processed or screened then the sales tax does apply.

The ruling contained in the fifth paragraph on page 10 of the circular should be amended by deleting the words "invoice forms used in invoicing his goods." The Department has ruled that where a firm purchases invoice forms, statements, etc., from the manufacturer thereof, and these invoice forms are to be used in connection with his own business, the sales tax chargeable thereon is 2 per cent.

The Department has ruled that articles purchased for the use of any Provincial Government or any department thereof, are exempt from the sales tax.

Re cash discounts: The statement set forth on page 11 of circular 266, that "If the tax has in the meantime been paid to the Government credit may be taken on the next return, for the amount credited to the purchaser," has been qualified by the Department by the following statement: "Providing that such next return is made within sixty days of the payment of the tax upon the amount of discount allowed. If the adjustment of the tax paid on the amount of the discount cannot be made within the sixty days, such adjustment can only be made by application for refund to the Department."

Returned Goods.

On page 11 of circular 266, it is stated that where a vendor has paid to the Government the tax on goods, and the goods are subsequenty returned, he may take credit for the amount in question on his next return. The Department has issued a new ruling relative to this matter, which provides that where the tax has in the meantime been paid to the Government, the vendor may at the end of the ensuing quarter, each of which shall terminate on the last day of March, June, September and December, respectively, file application, supported by affidavit, for refund of the amounts repaid to customers during the currency of the quarter, in respect of returned goods, attaching thereon the receipted invoices of purchasers for the amount of tax repaid. When the claim papers have been examined and found correct, a cheque in settlement of the refund will be issued. The same procedure will be followed in respect of claims for refund where goods are returned and similar articles of less value are delivered in exchange.

On page 7 of circular 266 it is stated that the Department of Customs and Inland Revenue had ruled yeast to be exempt from the sales tax. This ruling was subsequently cancelled, and accordingly sales of yeast by manufacturers and wholesalers are subject to the sales tax.

MANUFACTURER EXPORTER

Refund of Customs Duties Paid

Have You Filed Your Claims for 1918, 1919 and 1920 to Date?

CUSTOMS DRAWBACK CLAIMS

The customs law and regulations provide for a drawback of 99 per cent. of the **CUSTOMS DUTIES PAID,** including **WAR TAX** and **SALES TAX,** on imported materials used, wrought into or attached to articles **EXPORTED.**

The drawback is payable whether you import the materials direct or purchase them duty paid from **OTHER IMPORTERS.**

The latest ruling of the Department of Customs is in effect that **CLAIMS FOR 1918, 1919 and 1920 MUST BE FILED WITH THE COLLECTOR OF CUSTOMS ON OR BEFORE DECEMBER 31st, 1920.**

PREPARATION OF CLAIMS

We specialize in the preparation of schedules and claims for firms in all parts of Canada.

We bring you an expert service gained from **NINE YEARS' EXPERIENCE WITH THE DEPARTMENT OF CUSTOMS.** We have taken over the claims of a large number of firms, thus relieving them of **ALL DETAIL WORK, ELIMINATING DELAY IN THE PREPARATION AND PAYMENT OF CLAIMS. WE ASSURE YOU FULL REFUNDS.**

OUR CHARGES are based on the amount of the claims and the work involved. Our accounts being payable at the time of **SETTLEMENT OF YOUR CLAIM** by the Department of Customs.

Reference to the list of firms for whom we are acting inspires confidence.

Further Excise Tax Rulings

The rulings on page 11 of circular 266 under the headings, "Interlocking Concerns, Custom Work," "Manufacturers Performing Work for Others, Custom Work" and the first paragraph under the heading, "Fur Skin Dressers, Dyers and Dye Cleaners," are cancelled. Transactions which do not constitute a sale by a manufacturer or wholesaler or jobber, are not within the meaning of the Act. The Department of Inland Revenue has now ruled that the Sales Tax does not apply to custom work, where the only charge is for the labor of performing certain work, and the property in the goods remains that of the person or firm for whom the work is being done.

LICENSES: The Department of Customs and Inland Revenue advises that collectors of Inland Revenue are now prepared to receive applications for licenses. Full information as to the regulations governing the issue of licenses may be obtained from any collector or deputy collector of Inland Revenue and also from the Tariff Department of the Canadian Manufacturers Association.

Four classes of licenses are being issued, as follows:—

Sales Tax License:—To be taken out by manufacturers, wholesalers and jobbers who sell articles subject to the Sales Tax. Annual fee, $5.

Manufacturers' License:—To be taken out by persons, firms or corporations manufacturing and selling articles specified in sec. 19 BB, sub-sec. 4 of the Act. See pages 18 and 19 of circular 266 for sub-sec. 4. Annual fee, $2.

Note:—This license should not be confused with the sales tax license. Manufacturers required to take out a manufacturers' license will also be required to take out a sales tax license.

Jewellers' License:—To be taken out by persons, firms or ocrporations, and by the jewellery branch of a retail departmental store whose chief business is selling jewellery by retail. Annual fee, $2.

Retailers' License:—To be taken out by persons, firms or corporations who sell at retail articles specified in sec. 19 BB, sub-secs. 1, 2 and 3 of the Act. Annual fee, $2.

Re Wholesalers: The Department of Inland Revenue has ruled as follows:

If the wholesale branch of a firm transacting a wholesale and retail business is segregated from the retail branch and sales made by the said wholesale branch to the retail branch are charged at the same price as sold to other retailers, the wholesale branch is regarded as a wholesaler.

If a bona fide wholesaler selling to the retailer or consumer cannot segregate his retail from his wholesale business he may be regarded as a wholesaler upon condition that a sales tax of 1 per cent. is collected upon all his sales.

Value of Currency of Invoice

The Customs Department has issued a memorandum calling attention to the fact that the Customs Act requires all invoices to be made out in the currency of the country whence the goods are exported, or in the currency in which the goods are actually purchased, and that in computing the value for duty of such currency the rate thereof shall be such as has been ordered and proclaimed from time to time, and that such rate shall be based upon the actual value of the standard coins or currency of such country as compared with the standard dollar of Canada. For example, the value of the German gold mark, which is the standard coin of Germany, has been proclaimed at the rate of 23.8 cents, and the value of the French gold franc, which is the standard coin of France, has been proclaimed at the rate of 19.3 cents. By Act of Parliament the value of the British gold sovereign, which is the standard currency of Great Britain, has been fixed at $4.86 2/3.

The Department points out that the fair market value of the goods when sold for home consumption should always be shown in the terms of the standard coins of the currency of the country of export, whether this standard be gold or silver, and regardless of whether transactions in specie actually take place or not. If payments of specie have been suspended and the business of the country of export is carried on in a paper currency, the home market value of the goods exported may be shown in the terms of the paper currency, provided the value of the paper currency in relation to the standard coins be also shown. The governing value of the goods for duty purposes is the home market value in the terms of the standard currency of the country of export.

Invoices of shipments in which the fair market value as sold for home consumption is shown in terms of gold sovereigns in the case of Great Britain, gold francs in the case of France, or gold marks in the case of Germany, will be accepted by the Customs for entry purposes.

Where payments of specie have been suspended, and business in foreign countries is carried on in a paper currency, collectors of Customs have been instructed to accept invoices showing the home market value in terms of the paper currency, provided the relative value in gold is also shown, and the latter value in that event will be taken for Customs duty purposes. It is suggested that where goods are invoiced in paper currency the exporter should note at the top of each column the words "paper currency" as definitely establishing the fact that the amounts shown in the body of the invoice are in paper. The exporter should then endorse on the face of the invoice, and sign the same, a certificate giving the relative value of the paper currency to the gold.

Where duty has been paid, since the 22nd of July, 1920, the date of the Customs Memorandum, on invoices made out in paper currency, and which do not show the value in gold currency, refunds will be made of any amount overpaid provided the importer notifies the Customs of his intention to apply for refund and obtains corrected invoices showing the fair market value of the goods in the standard currency, or with a certificate showing the relative value of the paper to the standard currency.

Application for Re-adjustment of Class Rates from Vancouver

The Association has filed an application with the Board of Railway Commissioners for a readjustment of the class rates applicable from Vancouver to points in British Columbia and the Prairie Provinces. The application contends that the tariffs of the railway companies filed effective on September 1st, 1914, contained rates which were not in accordance with the direction of the Board in its judgment on the Western Rates Case. The section of this judgment relied upon reads as follows:

"2. Pacific Termini.

Between Vancouver and New Westminster and points east thereof:

(*a*) To and from points in Pacific territory the rates to be readjusted in the same ratio that is described above for Port Arthur.

(*b*) To and from points in Prairie territory west of Fort William the maximum first-class rates to be those west of Canmore and Crow's Nest, plus the Prairie Standard first-class rate difference between the actual mileage west of Canmore and Crow's Nest and the actual through mileage to or from the Prairie destination or shipping point, as the case may be."

The case was heard in Vancouver on October 12th, and the Vancouver Board of Trade and British Columbia Manufacturers Association joined in the application.

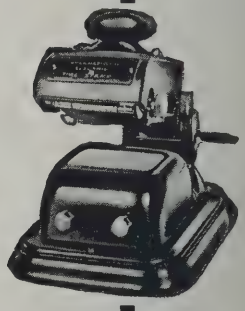
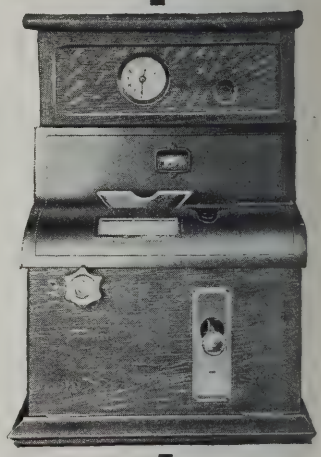
HAMILTON, CANADA



Make the Master Clock the Nerve Centre of Your Business System

Secondary Clock



A MASTER CLOCK in the manager's office will control by electrical connections as many units as you desire to install. Starting and stopping time may be announced by means of a bell-ringing system.

A SECONDARY CLOCK placed where the men can see it will keep them busy until the last minute without the loss of time resulting from frequent consulting of watches or "guesses" at the quitting hour.

Time Stamp

AN ELECTRIC TIME STAMP is invaluable in any kind of manufacturing activity. Month, day, hour and minute may be indelibly stamped on letters, invoices, agreements, or any other business documents—establishing a record beyond dispute.

"In and Out" Time Recorder

AN "IN AND OUT" RECORDER gives to the employer at any time a complete printed time record of his workmen, ready for pay-roll totalling.

A COST RECORDER is the "First Aid" of the manufacturer in grappling with the three elements entering into the cost of his output — Labor, Materials, Overhead. Without consulting his foreman or even leaving his office he obtains an accurate record, enabling him to classify labor costs, both productive and non-productive.

Synopsis of Proceedings Before the Tariff Commission

(*Continued from page* 70.)

L. E. Taylor, representing the Co-operative Seed Growers Association, Penticton, described the effort that was being made, with the assistance of government grants, to grow seeds for the use of Canadian farmers. He asked that a tariff of 10 per cent. general and 5 per cent. British preferential be placed on mangle, beet and carrot seeds, which are now imported free.

T. H. Riley, secretary of the Summerland Lumber Co., Summerland, a member of the Box Section of the B.C. Division of the C.M.A., showed that the box industry of the Okanagan District is entirely dependent upon the fruit growing industry.

Thos. Bulman, Ellison, B.C., speaking as a farmer, strongly supported a protective tariff.

W. F. Laidman, speaking again, but this time on behalf of the United Farmers of British Columbia, read a memorandum outlining the position of the latter organization. The memorandum endorsed the resolution passed by the B.C. Fruit Growers Association, requesting that the tariff be maintained on fruit. The United Farmers recommended the appointment of a Tariff Board, with farmer representation thereon.

NELSON.

September 30.—W. M. Cunliffe, Nelson Iron Works, Limited, Nelson, speaking on behalf of his own industry, asked that the tariff on his products remain unchanged.

I. R. Poole, secretary Mountain Lumber Manufacturers Association, read a statement asking for a duty of 25 per cent. on all lumber such as they produce that is now admitted free of duty, in addition to maintaining the present tariff as it stands in respect to those lines that are dutiable. Of their product 85 per cent. is rough lumber of the lower grade variety, the kind most in demand on the prairies. There was practically no demand for the remaining 15 per cent. of higher grade lumber on the prairies, and this was disposed of in the United States.

There are 45 mills in the Association, these being located east of the Cascade Range in the interior of British Columbia and in the southwestern part of Alberta. Among them they produce 90 per cent. of the lumber manufactured in this territory. Ten thousand men are employed by them in producing the lumber and manufacturing it for building purposes. During the winter employment is given as well to 2,000 prairie farmers and farm laborers. The total product last year was worth $8,250,000. Eighty per cent. of the cost of production went to labor. The product amounted to 315 million feet, which brought a revenue to the railway companies of $2,205,000.

The mills of Washington and Oregon, which sell 90 per cent. of the merchantable timber exported from the Pacific Coast, have immense quantities of low grade lumber on hand. This is not wanted abroad and in times of depression they are accustomed to sell this in Canada at very low prices in order to liquidate their banking obligations. Except for the exchange just now, this process would be going on at present. It happened in the years 1911-1914 and a number of mountain mills were forced to close as a result.

E. A. Staples, Otis-Staples Lumber Co., Jaffray, B.C., spoke in support of the general statement of the Association. He stated that practically all their machin-

Synopsis of Proceedings Before the Tariff Commission

(*Continued from page 96.*)

ery came from the United States and they paid more for it than their competitors across the line.

A. K. Leitch, manager East Kootenay Lumber Co., described to the Commission exactly the difference between the payments to labor before the war and now, and went on and explained where inefficiency exists now as compared with then, showing the Commission what this represented in dollars. Common labor obtainable before the war at $2.50 a day was now $6, with a work day of nine instead of ten hours. A pair of sawyers in 1914 produced 100 logs in a day, as against from 60 to 65 a day now. This was true of most laboring operations.

F. W. Adolph, Adolph Lumber Co., Baynes Creek, B.C., told the Commission frankly the financial condition of his own and other lumber companies. He stated that lumber sold by him for $39 f.o.b. mill, and paying a freight rate of $7 a thousand, was sold for $65 on the prairies.

F. A. Starkey, commissioner of the Associated Boards of Trade of Eastern British Columbia, endorsed the request of the Mountain Lumber Manufacturers Association.

J. J. Campbell, Willow Point Fruit Growers' Union, and E. Norman, secretary of the Kootenay Fruit Growers' Union, strongly endorsed the case which had been put before the Commission by the fruit growers at Vernon.

J. A. MacDonald, of the MacDonald Jam Co., Nelson, and Mayor of the city, speaking on behalf of his own industry, asked that the protective tariff on his products be maintained, pointing out that his industry bought all the fruit produced in the Nelson district.

W. H. Jones, Nelson, a printer, appearing for himself, complained that the prices charged by Canadian jobbers were too high in comparison with United States' prices.

Dates for British Industries Fairs Announced

Announcement is made that the British Industries Fairs, 1921, will be held concurrently in London and Birmingham from February 21 to March 4, and in Glasgow from February 28 to March 11. The three fairs, although held in different cities, are in reality only sections of one Fair and together constitute the greatest trade fair in the world.

The London Fair is directly organized by the Imperial Department of Overseas Trade on behalf of the British Board of Trade, while the fairs in Birmingham and Glasgow are organized by the municipalities of the respective cities under the auspices and with the support of the British Board of Trade. An important point in the organization of the three fairs is that they are held practically concurrently, and that each fair represents a specified group of industries. No industry is permitted to exhibit at two fairs, and consequently the buyer knows that at whichever fair he may be visiting he will find the whole range of exhibitors in any particular trade or trades. Further, by careful arrangement of the dates of the sections it is made easy for him to visit all three should he wish to do so.

The British Industries Fairs are not exhibitions. They are trade fairs, to which admittance is restricted to bona fide trade buyers seriously interested in the participating trades. Only British manufacturing firms are allowed to exhibit, and no exhibitor is permitted to exhibit goods other than those of his actual manufacture. The result is that buyers who visit the fair know that no articles shown on an exhibitor's stand can be purchased elsewhere in the fair. Exhibitors are also able to give proper attention to the buyer, and the buyer is able to do his business unhampered by crowds of sightseers.

The Association are in receipt of a letter from the Commercial Intelligence Branch of the Department of Trade and Commerce, enclosing a copy of a communication from Mr. Harrison Watson, Canadian Government Trade Commissioner in London about the British Industries Fair.

In his letter Mr. Watson states that he had been in touch with the Secretary of the Fair, and had expressed his willingness to attract the attention of possible Canadian exhibitors. On looking into the matter, however, it was found that while the management would be glad to include Canadian exhibitors, and is prepared to extend to them the same facilities extended to British manufacturers, so many applications have already been received that it would now be difficult to make room for any considerable number of Canadian exhibits. It has therefore been suggested that if Canada proposes to organize any special display it might be advantageous to defer it until the Fair of 1922.

As far as the 1921 Fair is concerned, if any Canadian exhibitors who wish to apply for space will do so immediately, every endeavor will be made to allot them space, provided any remains available when their application is received. Full particulars about arrangements, charges, etc., can be obtained from any of the British Trade Commissioners in Canada. Their names and addresses are:

Captain E. J. Edwards, H.M. Senior Trade Commissioner, 248 St. James Street, Montreal.

F. W. Field, H.M. Trade Commissioner, 260 Confederation Life Building, Toronto, Ontario.

L. B. Beale, H.M. Trade Commissioner, 610 Electric Railway Chambers, Winnipeg, Manitoba.

The following articles will be exhibited in London (February 21st to March 4th): —Fancy goods, including travelling requisites and tobacconists' sundries; leather for fancy goods, bookbinding and upholstery trades; brushware; paper, stationery and stationers' sundries; printing; toys, games and sports goods; cutlery, silverware and electro-plate; imitation jewellery and hard haberdashery; jewellery; watches and clocks; spectacle ware; scientific and optical instruments; glass and glassware; china and earthenware; drugs and druggists' sundries; furniture; basketware and cane furniture; musical instruments.

In Glasgow (February 28th to March 11th) the sections are:—Textiles of all descriptions; ready-made clothing, including hosiery; hats and caps; boots, shoes and gloves; carpet and upholstery materials; foodstuffs (prepared and preserved) and beverages; chemicals (light and heavy); domestic chemical products.

The Birmingham (February 21st to March 4th) sections are:—Brassfoundry of all kinds; hand tools and tools for use on machinery; hollow-ware; cooking and heating stoves; mechanical rubber goods; tubes and fittings of copper, lead, brass, steel, etc.; non-ferrous metals and alloys in all forms, such as ingots, sheets, rods, wire, etc.; metallic bedsteads; metal furniture for office, shop, garden and camp; sanitary metal ware and earthenware; architectural and ornamental metalwork; scales, balances, etc., and measuring appliances; general hardware of all descriptions, including nails, locks, domestic utensils, etc.; perambulators, mailcarts, pushcarts, etc.; firearms and

fishing tackle; machinery belting; cycles and motor cycles; accessories for cycles, motor cycles, cars and aeroplanes; paints, colours, varnishes, etc.; ropes (wire and fibre); saddlery and harness, and metal furniture for same.

Packing and Marking of Castings, Etc.

A bulletin has recently been issued by C. N. Ham, Secretary of the Express Traffic Association of Canada, covering suggestions regarding the packing and marking of castings, machine parts and such articles. The bulletin reads as follows:—

(*a*) When boxed, barreled, crated, or trussed, the name and address of the consignee should be marked on the box, barrel, crate, or board, by brush, stencil, or crayon. Tags should not be used on such shipments

(*b*) When not boxed, barreled, crated, or trussed, and there is sufficient smooth surface for the purpose, the address must be plainly marked on the article with durable paint.

(*c*) When not boxed, barreled, crated, trussed, or when not possible to mark as provided in preceding paragraph, shipments must be marked with not less than two wooden, leather, metal, cloth, rope stock or sulphite fibre-tag-board tags. Rope stock or sulphite fibre-tag board tags may be either wholly of sulphite or rope stock or a combination of both, must test not less than 14 point, have reinforced metal eyelets, and must be attached by wire not less than 23 gauge, or strong cord. Tags must be attached wherever possible to unexposed parts of the article in order that they may not become detached in handling.

(*d*) When tags are used for marking rods, shafting, bars, pipe, iron bed sides, automobile springs and other articles of like character, shipped singly or in bundles without packing, there must be two tags, conforming to specifications of paragraph "C," both tags securely attached to the article by wire not less than 23 gauge, or strong cord; one tag to be concealed by being bound to the article with a burlap covering, the latter securely fastened at each end.

(*e*) When metal articles are shipped in sacks, the address must be shown or tag conforming to the specifications in paragraph *c*, attached either by wire or strong cord, and an additional tag bearing the same address must be enclosed in the sack. Sacks of metal articles must not exceed 50 lbs. in weight.

Railway Board Grants Increase of Rates

On September 6, the Board of Railway Commissioners issued their judgment on the application of the railway companies for a rate increase. This gave an increase in rates along the following lines: Until December 31, 1920, a general increase of 40 per cent. in eastern freight rates and 35 per cent. in western freight rates, with 20 per cent. both east and west in passenger fares, which, however, should not exceed 4 cents per mile, 50 per cent. in sleeping and parlor car rates and 20 per cent. on excess baggage. Commencing January 1 next and until there is another revision of rates, there is to be a reduction on freight to 35 per cent. in eastern territory and to 30 per cent. in western territory, with 10 per cent. reduction in passenger fares up to July 1, 1921, when passenger fares are to come back to the basis in effect prior to the coming into force of the judgment; but continuing the full increase in parlor and sleeping car rates and excess baggage.

On September 28, the Government heard an appeal from various interests against the judgment of the Board of Railway Commissioners. There appeared before the Cabinet, Hugh Blain, Toronto, representing the wholesale grocers; H. J. Symington, Winnipeg, representing the Government of Manitoba; G. R. Geary, K.C., representing the City of Toronto; D'Arcy Scott, counsel for the Saskatchewan Government, and A. C. McMaster, representing the Toronto Board of Trade.

Tendered a Dinner

Toronto Manufacturers Entertain Their Distributors at an Enjoyable Function

On September 17, Crouse-Hinds Co., of Canada, Limited, and Harvey Hubbell Co., of Canada, Limited, gave a dinner at the King Edward Hotel, Toronto, to their Toronto distributors. The guests included representatives of Benjamin Electric Mfg. Co. of Canada, Limited; Canadian Electrical Supply Jobbers' Association; Central Electric Supply Co., Limited; the Duncan Electrical Co., Limited; the Masco Co., Limited; McDonald & Willson, Limited; Monarch Electric Co., Limited; Northern Electric Co., Limited; Rogers Electric Co., Limited.

Cords and Pulleys

Aero Manufacturing Company, Limited, Are Established at Sherbrooke and Lennoxville, Quebec

The Aero Manufacturing Company, Limited, with offices at Sherbrooke and factory at Lennoxville, Quebec, are a firm incorporated under a Dominion charter with a capitalization of $75,000. Their products are cords, pulleys and similar articles of the "Aero Brand," including Aero clothes line pulleys, for the manufacture of which they have a complete wood-working and wire-bending equipment.

The Lennoxville plant has a personnel of some fifteen employees and is equipped with twenty-four braiding machines with a maximum yearly production of some $300,000 in value. L. M. Adams, Jr., is president and general manager of the company. The other principal officers are: G. R Brackett, vice-president; J. M. Phelan, secretary, and G. K. Scott, treasurer. The company are successors to the Le Baron Manufacturing Company.

Why a Cost System?

Several Reasons Why Manufacturers Should Introduce Systems in Their Industries

In a bulletin just issued under the title, "What a Cost System Should Do for You," the Fabricated Production Department of the Chamber of Commerce of the United States calls attention to the purpose and value of cost accounting.

"Accurate information regarding the various elements which go to make up costs," says the bulletin, "automatically eliminates arbitrary empirical or guess costs which prevail to a surprising degree among many manufacturers. Cost keeping brings to light inefficiencies in system by calling to attention the cost of its operation and points out equipment that has become inadequate, by showing an excessive cost of product coming therefrom; it points out employees who are below the standard required, and permits of performances being kept within certain limits by watching the accumulation of costs.

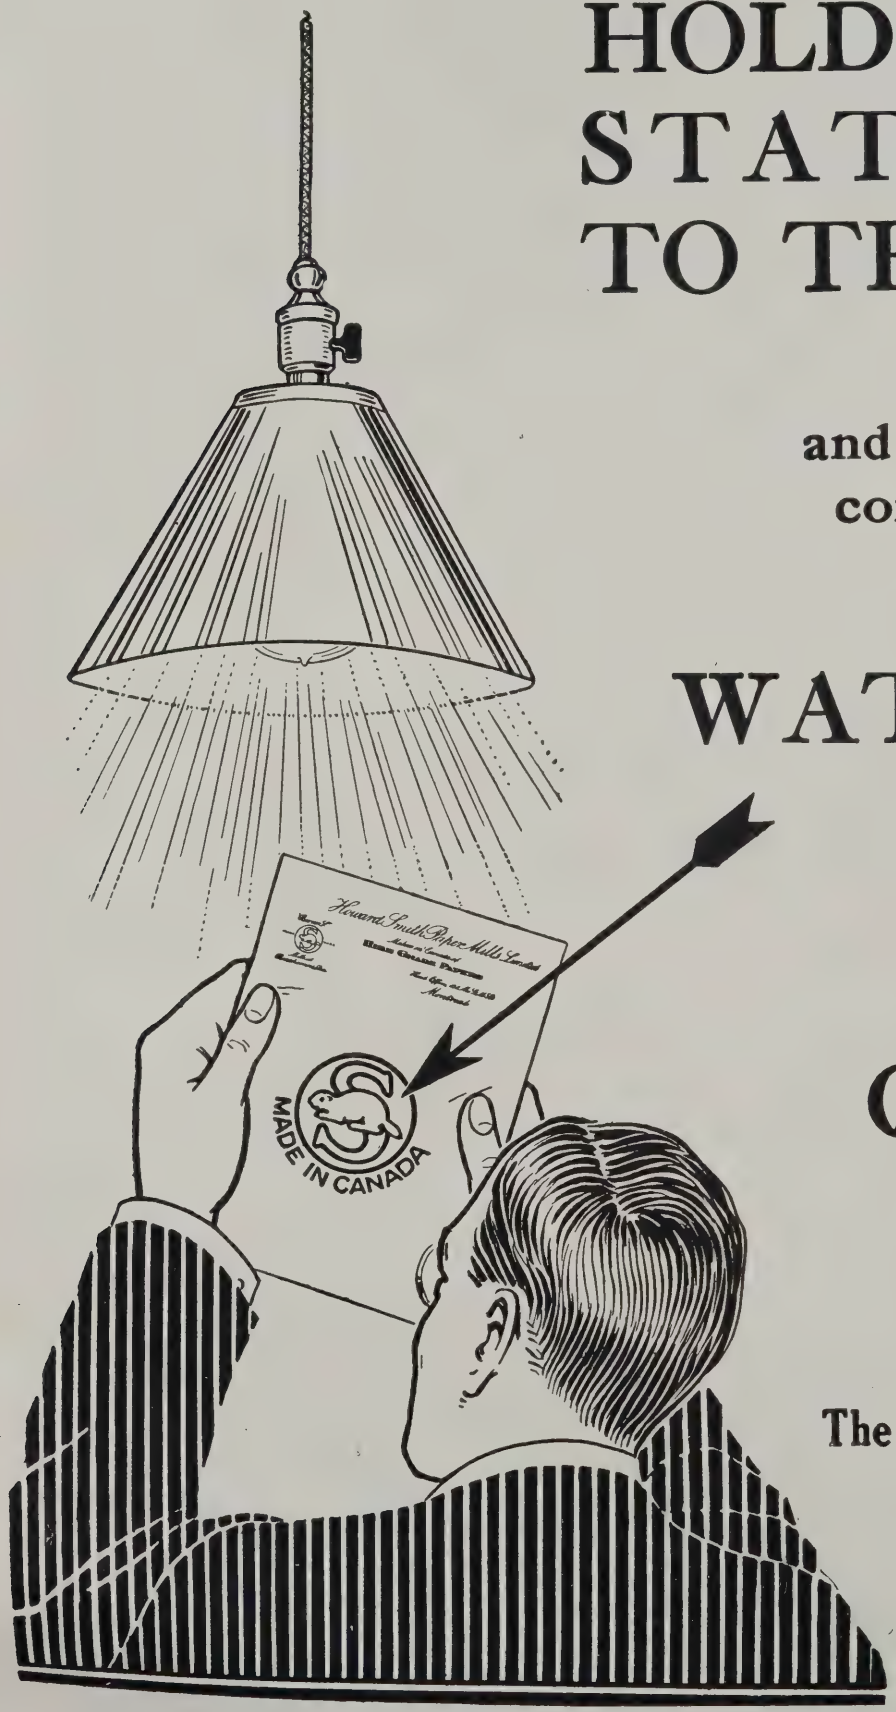
Increased production depends largely on the intimate knowledge the management has of all elements in their manufacturing operations which can only be supplied through an adequate cost system. It enables them to establish proper control and increase output as warranted by the cost record.

"In many plants considerable sums of money are spent to establish a standard practice of operation. From time to time certain variations from the established standard practice occur, affecting costs in an adverse way. Timely cost reports showing what is happening, rather than what has happened, suggest immediate correction of such inefficiencies. It is not sufficient that executives know that expenditures are excessive; they should be supplied with information to show exactly where these excessive expenditures occur and take action. Definite responsibility for expenditure as the authority to make the expenditure should be fixed by an adequate system of cost accounting."

The bulletin takes occasion to say that part of the work of the Fabricated Production Department will be to assist organizations in obtaining for the industries they represent cost systems as practicable and as simple and uniform as possible.

"We shall not either devise or install cost systems," it says, "but by co-operative study of each situation, aided by the contributed experience of trade organizations and expert knowledge of the subject, help those who are disposed to help themselves."

At the annual meeting of the Canada Bread Company, Limited, held at the head office in Toronto on September 28th, D. O. Ellis, of Toronto, and A. A. Ryley, of Winnipeg, were added to the board of directors, replacing H. C. Tomlin and George Weston, who retired.



The Nova Scotia Steel & Coal Company has launched its seventh vessel, and engineers who have had an opportunity of inspecting it state that it is the best steamer of its kind which has been launched on the Atlantic coast since the inauguration of the steel ship-building industry in Nova Scotia. The *Volunda* is a steamer of about 2,800 tons deadweight capacity, with the following dimensions: length 280 ft. 3 ins., breadth 38 ft. and depth 20 ft. 6 ins.

Immigration to Canada is increasing rapidly according to a statement issued by Hon. J. A. Calder, Minister of Immigration and Colonization. During the month of June the increase over the same month last year amounted to 109 per cent., while for the three months of April, May and June, 68 per cent. increase is shown over the same three months of 1919. Of the 49,242 immigrants who entered Canada in the three months named, 28,487 were British, 16,397 were from the United States, and 4,358 from other countries.

The Federal Government has approved the Manitoba Government's highway programme, the construction of which will take four years to complete, involving an expenditure of more than four million dollars, of which the Dominion authorities will pay $1,600,000. One is a gravel highway to Lake Winnipeg, 45 miles long, to be completed this year. Others are Winnipeg to Rainy River, Winnipeg to Emerson, Winnipeg to Reston, through Portage La Prairie and Brandon to Elkhorn, and one through Minnedosa to connect with the Saskatchewan system at Russel.

Owing to the exportation of pulp overseas, the demand has increased 75 per cent., according to Dr. E. L. M. Dechene Deputy Minister of Lands and Forests for Quebec. "An attempt is being made," he states, "to substitute jackpine for spruce in the manufacture of paper, as millions of tons of the former are available in the Province of Quebec." Other observations of Dr. Dechene are that there is not likely to be any decrease in the price of wood pulp for three years; and that three million new trees will be planted in Quebec this year. It is the aim to plant two trees for every one cut down.

OFFICE AND FINANCE

Giving the Office a Personality

**Functions of the Courtesy Department in a Modern Office—
The Reception Clerk as a Business-getter—Personality Pays**

By ALAN M. IRWIN

"He's busy."

"Sure," in reply to your question, "you can wait there."

How often have you heard those words issue from the gum-chewing mouth of the combination P.B.X. operator and enquiry clerk? How often has your estimation of Black's office dropped in response? "Too often!" will probably be your answer.

Not an Impressive Reception.

That sort of reception does not impress one with the personality of Black's, and no matter how cordial your reception when you meet the executive, the memory of the enquiry desk will haunt you.

A story is told of a brilliant young idler who wished to marry the daughter of a Captain of Industry and who approached her father in the following manner:

"A job? No, I haven't, but look here—I've a good appearance, pleasant manner and genial disposition—you hire me to meet your customers, keep them happy and all that sort of thing, don't you know."

"Not me, I've just employed five men to insult the customers."

Perhaps he had so much business that he wanted to keep it away—all the more reason for a courteous, pleasant personality to meet the disappointed customers. Any clerk can turn away business, the type mentioned above does it all the time. That, unfortunately, is only too easy. What is needed is someone whose manner is a business-getter, who creates an atmosphere of welcome, whether to your banker, your biggest customer or the man who wants to sell you something.

It is a dispiriting thing to have to sit on a hard bench, with your feet in the way of every passer-by, facing a counter, while you wait what seems an age for your man to see you.

Yet this type of reception is distressingly common. So common in fact that if it were not for the name on the door, it would be a hard task to distinguish Black's office from White's.

Office Personality.

Imagine in the place of that gloomy picture, a bright, tastefully-fitted office—an office where you are greeted by a cheerful enquiry clerk, who rises to greet you as you approach with "Good morning, sir."

Of course, you like it; he's human; the office seems human. In this case the executive you wish to see is engaged, but instead of kicking your heels in front of this counter, and involuntarily overhearing Miss Jones tell her sister (over her employer's telephone) what she is going to wear to the dance, you are shown into a pleasant waiting-room.

Here, magazines, trade papers and the dailies are to hand. You may forget the time you have to spend waiting. You realize that this firm by the quiet dignity of its appointments is one that pays attention to the finer side of business—that it is not so immersed in "Dollaritis" that it cannot receive you in the same manner that you receive your friends at your home.

Is there not a difference? It is not hard to say to which house you will give business.

A Comfortable Reception Room

An example of the infusion of personality in the office is shown in the accompanying illustration of the reception room of the Salada Tea Company. The president of this firm is a collector of curios, which the reader will note, are all from the Orient. The tasteful placing of beautiful rugs, inlaid tables and idols in and around the offices, not only adds distinction to them, but subtly reflects the nature of the business carried on by the firm.

While in the instance mentioned the appointments are expensive in character, it does not necessarily follow that a lavish scheme of decoration is required.

A reception or waiting-room may be fitted up in a not too expensive manner with a few comfortable chairs, some low tables bearing current magazines, newspapers, ash trays, etc., and the rest of the necessary atmosphere may be supplied by the courteous attitude of those with whom the visitor comes into contact.

Courtesy First.

Office boys to greet visitors are, or, should be, a thing of the past. One's first impression is very often a lasting one, and it is most important that it shall be a good one.

The office boy cannot be expected to know that although, when I enter your office and ask for the president, both your

The Imperial Bank offers exceptional banking facilities to Canadian Manufacturers. Branches throughout Canada. Agents and correspondents in all the world centres.

Collections made at all points in Canada and in foreign centres.

Drafts—Money Orders and Letters of Credit issued, available throughout the world.

Exchange—Domestic and Foreign Exchange bought and sold.

Government and Municipal Securities dealt in at all branches.

Savings received at all branches—interest credited half yearly at current rate.

Accounts of Merchants and Manufacturers solicited.

HEAD OFFICE - TORONTO

firm and myself would be better served if I were to see th manager of the export department.

No one cares to state his business in detail to the offic boy and the result is that, after waiting to see the president I find that his time and mine have been wasted and that have to repeat my business a second time when I see th right man.

To correct this hitherto necessary evil a system is comin into force. Under the new plan, a clerk is detailed to loo after the interests of visitors. His duties are numerous, th chief of which are:

(1) To accord a courteous reception to persons calling o the firm.

(2) To ascertain their business and see that they inte view the proper person.

(3) To make any waits as pleasant as possible.

(4) Generally to convey to callers the knowledge that th firm is glad to know and do business with them.

The training for this new position is a very thorough on and should include a couple of weeks' spent in the mailin department routing mail through the office. Two weeks t a month should be allowed for the study of the activities c each division of the office and the reception clerk should hav the benefit of a few informal chats with the differer executives.

He must be a man of pleasing appearance, courteous i his bearing and well-mannered.

As the outpost of the firm he is responsible for the fir impression created in the mind of the customer, hence th importance of the human side of his character.

The most advantageous situation for his desk is in th reception room itself, and to him without delay the visito are ushered.

On receipt of the caller's card he will ascertain, if a pa ticular executive is not asked for, what is the nature of th business.

Then, keeping the card before him, he will hand to messenger a slip bearing the name and business of the call which will be taken at once to the executive.

Should a wait be necessary, Mr. Visitor is invited to hai up his hat and coat, draw up his chair and is introduced such others as are waiting. The clerk when making th introductions will carefully state the nature of the busine in which each is engaged, thus making possible a friend talk between those whose interests are allied. Much of th irksomeness of waiting is lost when the surroundings a pleasant, and when the time may be pleasantly spent in co versation. In the absence of others waiting, it devolves upo the "Courtesy Clerk" to entertain his visitor, and he m make himself very useful to out-of-town visitors by suc things as recommending a good hotel, a good play or su gesting visits to points of interest in the city.

When Mr. B—— telephones that he is free, the visitor personally conducted to his office, the reception clerk asce taining on the way if the visitor is personally known to th man he wishes to see. If this is not the case he will perfor the introduction and lay the visitor's card upon the desk.

Throughout the tone is one of frendliness; the visit feels that he is welcome and is glad that he has come. Ho different from his thoughts if he were kept standing at counter for half an hour.

Lessons from Department Stores.

The department store can teach a lesson in courtesy. is almost impossible to find a store where courtesy is n impressed upon the staff, or to find one where there is n every convenience for the benefit of customers.

Free check rooms, writing tables supplied with writing materials, rest rooms, information bureau, even theatre booking offices—yet, here the sales are only in comparatively small amounts.

These all express personality—the soul behind the business—and in return they create for themselves a goodwill that more than repays for all the effort expended.

Your customers like it, your friends like it, and your enemies, should you be unfortunate enough to have any, have to admit that "there's something about So-and-So's."

Personality pays!

A Successful Year

Report of the Canada Bread Company, Limited, for Year Ended June 30th, 1920

The report of the Canada Bread Company, Limited, for the year ended June 30th, 1920, indicates a successful year. President Mark Bredin in his report points out that last year was a banner one in regard to the volume of business.

Manufacturing profits amounted to $293,881, which is an increase of $117,280 over the item shown as manufacturing profit and other income in 1919. Interest from investments is set down at $16,237, compared with $19,944 a year ago. Balance July 1, 1919, was $103,419, as against a net balance, after payment of business profits war tax for 1915-16-17, of $113,706 on July 1, 1918. Charges against these items for the period include depreciation on plant of $50,000; depreciation on war bonds, $10,214; profit tax 1918, $13,828; leaving a balance carried forward as at June 30, 1920, of $172,295, compared with balance on June 30, 1919, of $103,419.

Other principal items compare as follows:—

	1920.	1919.
Preferred dividends	$ 87,500	$ 87,500
Depreciation on plants	50,000	.....
Depreciation on war bonds	10,214	.....
Bond purchase	12,500	.....
Depreciation and bond purchase	.....	50,000
Bond interest	67,199	67,989
Ingredients and supplies	498,097	131,250
Total assets	5,973,727	5,534,418

Annual Meeting

Financial Statement of the Interprovincial Brick Company of Canada, Limited, is Presented

The annual meeting of the Interprovincial Brick Company of Canada, Limited, was held in September, and the financial statement for the year ended June 30th, 1920, was presented to the shareholders. Net sales during the year amounted to $179,486 against $93,462 in 1919. Net profits were $36,972 as against $11,169. Net earnings in the year were at the rate of 24 per cent. on $150,000 common stock before providing for special write off, and after this was taken into consideration were equal to 16 per cent. earned. The common stock was raised to $200,000 through an issue of $50,000 at the end of the fiscal year. In all $39,584 in dividends was paid, which sum includes $29,581 accumulated dividends from September 30, 1914, to December 31, 1918. This payment tended to reduce profit and loss balance which stood at $13,654 at the year end against $20,269 in the previous year.

The balance sheet shows the company to be in stronger condition financially, the following being the principal comparisons:—

	1920.	1919.
Total assets	$ 385,624	$ 290,221
Cash	1,587	1,983
Inventories	66,761	25,721
Property, etc.	253,209	275,711
Investments	50,000	2,500
Accounts payable	12,133	1,934
Tax reserve	5,149	1,100

BUSINESS

LARGE AND SMALL

This bank is equipped to render complete banking facilities to individuals, partnerships and companies, both large and small. With branches throughout every province of Canada, and correspondents in all parts of the world your banking business will be handled with promptitude and at the minimum of expense.

Our facilities are at your disposal.

It Gets the Dirt
It's a BOWSER Oil Filter

No. 1—Sectional View of Bowser Filter Section Assembled

No. 2—Filter Disc with Dirt Filtered from Oil.

The pictures shown here illustrate the Bowser Filter Section as used in the Bowser Oil Filter.

No. 1 shows the Filter Section assembled, ready for use. No. 2 shows one of the Filter Discs with dirt that the Filter has collected from used oil. This pile of dirt is about 6″ in diameter and from 2″ to 3″ high.

There are twelve of these Filter Discs and Cloths in a Bowser Filter Section—each as effective as the one you see pictured. As many complete Filter Sections as needed are furnished in the Bowser System. You may judge for yourself as to the value of such equipment.

Bowser Systems are applicable to any size and type of power producing and transmitting machinery.

We will be glad to send literature and explain to you how the Bowser principle of Oil Filtration can be applied to your Boiler plant.

Laurentide Company, Limited

Profits for the Six Months Ended June 30th, 1920, Amount to $1,499,538.87

The annual report of the Laurentide Company, Limited, for the year ended June 30th, 1920, shows that the profits for the last six months of that year, after setting aside sufficient reserves for depreciation, business profits, war tax, and depletion of timber limits, were $1,499,538.87. On January 1st of this year the company were organized and the shares distributed. As it was not deemed advisable to change the fiscal year, it was therefore necessary to render the statement for the six months period.

The directors report favorable progress on extensions to the plant in the form of two new paper machines with additional pulp capacity. It is expected that the installation of these new units will be completed and that they will be in operation by January 1st, 1921.

Profit-Sharing Plan

National Cash Register Company, Limited, are Sharing Profits Equally With Employes

The profit-sharing plan adopted by the National Cash Register Company, Limited, was explained to the employes recently by Frederick B. Patterson, vice-president of the company. The arrangement is characterized by an extreme liberality towards the employes, calling for an equal division of profits between the company and those employes who are not members.

The profits of the company are to be determined by an outside firm of accountants. From the total profits will be deducted an amount equal to six per cent. on the company's investment, not including the value of patents and "good-will." To offset this six per cent., the employes will receive the highest wages paid for their class of work.

The remaining profits will then be divided equally, the fifty per cent. which goes to the employes being paid in cash as near as possible to the half-yearly accounting dates. The fifty per cent. which goes to the company may be kept in the business for new buildings, machinery, extensions, etc. The employes receive their share unconditionally.

For the operation of the plan the employes are divided into five groups. The first, executives, will receive 12 per cent. of the total profits; the second, foremen, 5 per cent.; the third, job foremen, 8 per cent.; and the fourth, all who have been employed over one month and are not in the first three classes, 25 per cent. Only the fifth group, those who have been in the company's employ less than thirty days, do not share. Each man's share is based on the salary or wages received at present.

Officials of the company expect that the gain in loyalty and production and the decrease of labor turnover resulting from this scheme will make for an increased fall's business. The policy of the company has always been to consider the good of the workers and it has been justified by their success.

St. Lawrence Flour

Profits for the Last Fiscal Year Showed Drop of About Thirty Thousand Dollars

Profits of the St. Lawrence Flour Mills Co. for the year ended September 4th amounted to $215,077, comparing with $245,594 for the previous year, and $268,737 for 1917-18. After the payment of bond interest and dividends on the preferred stock, there remained available for application on the common stock, $161,432, equivalent to 13.5 per cent. This compared with 16 per cent. last year. Common stock dividends

of 6 per cent. with a bonus of 4 per cent. were paid. This, together with fixed charges, etc., took $202,078 of the year's profits. During the year a special bonus of 10 per cent. was distributed among the common shareholders, this being taken out of a new general reserve created for the purpose. A surplus of $397,829 was carried forward into the current year.

Fixed Assessment Granted

Lakefield Ratepayers Encourage Development of Canada Cement Company's Plant

On September 27th a by-law to aid the Canada Cement Company, Limited, was carried by the ratepayers of Lakefield, the vote being 193 to 8. By this by-law the municipal council is authorized to grant the company a fixed assessment of $50,000, in return for which the company will develop their plant at Lakefield, which has been standing idle for several years.

Lake of the Woods

Company's Earnings Showed a Comparatively Slight Decrease Over Previous Year

Total profits of the Lake of the Woods Milling Co. for the company's last fiscal year amounted to $732,232, as compared with $756,616 in 1919, and $857,914 in 1918. After the payment of bond interest and preferred dividends, which showed no variation from the previous year, there remained a balance of $573,232 applicable to the common stock. Allowing for the increase in the common stock capitalization effected during the year, this result was equivalent to approximately 23.4 per cent. on the shares, compared to 28.5 per cent. last year and 32.3 per cent. in 1918. After all deductions, including payments to common shareholders, there remained a surplus of $179,232 to carry forward, bringing the balance to the credit of profit and loss up to $1,161,647.

The Follow-Up Letter

How Properly Personalized Letters Create Good Feeling and Make Sales Easier

(From "System")

Personalized follow-up letters, mailed according to a definite time schedule, back up the 300 salesmen who sell our product—a device to enable the retail merchant to handle his charge accounts more easily. After several years' testing, we have developed a method that produces excellent results—a method that puts personality and punch into our direct mail advertising and becomes a real aid to the salesmen.

We never send a letter out to a prospect until we first know the best angles of approach; and we never send a letter to anyone but a live prospect. His name is usually that of an inquirer who has written in answer to our advertising or a dealer who has already been interviewed by one of our salesmen.

The instance of one of our typical prospects will illustrate our follow-up plan. Brown has written the company for information about our products. The sales promotion department immediately fills out a call notice in triplicate and sends two of these notices to the salesman in the territory from which the inquiry comes; the triplicate is retained in the office. The salesman fills in the duplicate notice after he has made the call and returns it to the main office. At the time the call notices go out, a letter leaves the service department for the prospect, thanking him for his inquiry, and telling him that our representative will call to explain our products.

If no sale is made during the salesman's first call, he fills out, in triplicate, one of our forms which lists Brown's

What Is Ahead?

Canadian industry is entering on a new phase in the era of readjustment. It now faces before-the-war competition under after-the-war conditions. Waste must be eliminated, every penny saved, every dollar of capital made effective, for additional capital is expensive.

A Manufacturer's Opinion

"In the trying days ahead I want to be protected with the most modern methods of management. I need an organization which is not overmanned and which will guide my business at the least cost. I need a system of production control that will keep down my investment in high priced raw materials. I need a system of accounting which will tell me the profit or loss by departments.

"I need most of all trained assistants to help me with these plans. I have not the time to investigate what others are doing, nor the patience or freedom from each day's pressing problems to work out my ideas."

These are the reasons which impelled one of our clients to commission us to install a comprehensive system of cost accounting and production control in his plant, and to advise him on matters of organization.

GRIFFENHAGEN & ASSOCIATES, Limited

Industrial Engineers, Accountants and Employment Advisers

TORONTO
CONFEDERATION LIFE BLDG.

MONTREAL OTTAWA

important objections and interests and the method of credit accounting he uses. The original is sent to the main office with the call notice report; the duplicate goes to the district manager, and the triplicate is retained by the salesman for future use. If our salesman discovered the prospect, he supplies the same facts to the main and district offices.

When the form reaches the sales promotion department, a prospect's card is made out for the follow-up. This shows Brown's name and address, his line of business and the number of accounts and credit accounting plan he uses. A careful survey of the salesman's report on the dealer's major interests and objections is made preparatory to the direct mail campaign that follows soon after.

If the prospect is concerned about the avoidance of forgotten charges, the accessibility of accounts, increased collections, and time and labor-saving devices, the sales promotion department knows which letters and enclosures should be sent to this prospect. The director of follow-ups can readily decide the logical order in which the letters should go out.

The first letter, in this case, covering the problem of forgotten charges, is mailed immediately upon filling out the card. The second letter, dealing with the accessibility of accounts, leaves the office two weeks later. The third letter goes out three weeks after the second; the fourth, four weeks after the third; the fifth, a month later; and so on until the major interests are exhausted.

We plan to have the prospect receive at least five letters before the salesman makes a second call. If the prospect should order at any time during the campaign his card is turned over and the "user" side filled in for the "users" cabinet so that the sales department can keep track of his future orders. We try to put a real personal touch in each letter. We find the prospect's point of view, and appeal to him from that angle. In this way we can show him how our products will fit his needs.

Although the letters are processed, the prospect's name and address are filled in and we introduce his name several times in the letters to accentuate the individuality and directness of the appeal. So well is his name put into the letters, that even experts cannot readily say that the hundreds of these letters which leave our offices daily have not been individually typed.

The results of these letters are readily apparent. The salesman knows that we are backing him up. On the day that letters go to prospects in his territory, we mail him duplicates of each letter. The letters are intimate reminders. He knows the arguments and appeals that have been put before his prospective customer, his own sales talks have been repeated and reinforced.

He is given a direct incentive to greater initiative and effort. "It gives a man a feeling of satisfaction to know that the house is actively behind the man outside," writes one of the salesmen. And many other salesmen have reiterated the same statement.

District managers and salesmen report more sales for every hundred prospects reached. They find that the letters create a lot of good feeling and invariably make sales easier.

The company's sales have increased 25 per cent. in 1919 over those of 1918, and last December, the dullest month in every year in the firm's history, was the banner month of the year. Of course, we cannot attribute all this growth to the follow-up plan alone. Other considerations have entered as well, but the personalized letters have more than done their share.

Factories Rejuvenated

Is production handicapped by a plant that is out of date compared with those of your competitors? LOCKWOOD, GREENE can tell you whether it would be more profitable to build a new plant, or to remodel the present one, install improvements, revise methods, and re-route the work.

LOCKWOOD, GREENE is not a contracting organization. It plans—studying efficiency in a practical way and placing its experience at the service of Business. Write for "Building with Foresight."

Canada's Industrial Expansion

A Record of Progress

Universal Plate Mill

Dominion Foundries and Steel, Limited, Spend One and a Half Millions on Extension

A mill known to the trade as a 27 in. by 40 in. by 72 in. universal plate mill is being added to the plant of Dominion Foundries and Steel, Limited, at Hamilton, Ontario. It will be the only mill of its kind in Canada, and will cost in the neighborhood of $1,500,000. It will have rolls 27 in. in diameter and 72 in. long, which will roll universal plate 40 in. wide and sheaved plate 66 in. wide.

In connection with this mill the company have installed a manipulator which will enable them to make billets and blooms of the larger sizes used by machine shops, forging plants and rolling mills. The steel requirements of Canada are very great, the average importation of such products as this company intend to supply being 605,218 tons for the years 1912, 1913 and 1914. As Dominion Foundries and Steel expect to increase their monthly output from 5,000 to 15,000 tons when operations start in the new mill next December there should be an appreciable decrease in the amount of steel products imported.

Brush Handle Factory

Rubberset Company, Limited, Are to Make Wooden Brush Handles at Gravenhurst, Ontario

About the middle of October or shortly after the Rubberset Company, Limited, expect to open a brush-handle factory at Gravenhurst, Ontario, in what was formerly known as the aeroplane plant. This has been completely remodelled at considerable expense, and motor equipment and a $10,000 dry kiln have been installed.

The plant at Gravenhurst will be used exclusively for the manufacture of wooden brush handles and the output will be absorbed by the company itself. An initial output of about 15,000 handles per day is expected, valued at between six and seven hundred dollars. These will be sent to the Canadian factory in Toronto and to the parent factory in the United States. In a short time it is hoped that all handles used by both the Canadian and United States companies will be supplied from Gravenhurst. From thirty to fifty hands will be employed at the start. The wood will be purchased from firms in the neighborhood.

Making Galvanized Ware

Port Arthur Manufacturing Company, Limited, are Growing Rapidly and Making New Lines

Manufacturing operations are now well under way at the works of the Port Arthur Manufacturing Company, Limited, who are makers of tinware and galvanized iron at Port Arthur, Ontario. So rapid has been the growth of this company that already they are looking for new and larger premises, the building occupied at present, formerly the property of the McRae Manufacturing Company, having proved too small.

Some of the articles made by the company are galvanized pails, flour cans, oil cans, tubs, hods, scoops, pans, water tanks, boilers and sheet iron stoves. A recent and important addition to this list is a washing machine which is being built for electric, water or gasoline power, as well as for ordinary hand-power.

Before spring the company expect to be employing from 25 to 50 men and boys. The president and general manager is A. Whiddon, and J. K. Kennett is vice-president and secretary-treasurer. The directorate cannot at present be given, as a reorganization is taking place.

Enlarge Winnipeg Plant

The Waldorf Paper Products Company Build Extension to Their Paper Stock House

The Waldorf Paper Products Company, who operate a plant in Winnipeg for the conversion of waste paper into useful products, are making an addition to the front of their paper stock house. The extension is a two-storey building 40 x 20 feet; the office will be on the second storey and the remainder of the building will be used entirely for the grading and packing of waste paper.

The estimated cost of erecting the new building and remodelling the old is $20,000. Electric conveyors, baling machines and sorting equipment are being installed at an approximate cost of $12,000. The company expect the work to be completed about November 15th, and also expect that their output will be doubled within one year from that date.

Present improvements are temporary, as a larger and more modern building will be required within a short time. The paper mill connected with the company consumes 140 tons of paper stock daily. As a provision for the expansions contemplated, the capital stock is being increased from $20,000 to $100,000.

Make Addition to Factory

Simonds Canada Saw Company, Limited, Add a Storey to One of Their Buildings

Simonds Canada Saw Company, Limited, makers of saws, knives, files and steel at Montreal, are enlarging their plant by a one-storey addition to one of their main constructions, 175 by 70 feet. Including heating, plumbing and sprinkling apparatus, the estimated expenditure is in the neighborhood of $50,000.

Building operations commenced on the first of September and the addition should be completed on or before November 1st. The company report that their business is in a flourishing condition, and they expect a material increase in output from the new addition.

Knitting Mills Enlarge

The Perfect-Knit Mills, Limited, Erect New Building at Listowel, Ontario

A new four-storey building, 50 x 250 feet, is being added to the plant of The Perfect-Knit Mills, Limited, at Listowel, Ontario. For the basement solid cement is being used, while brick and mill construction are planned for the balance. The building complete with sprinkler will cost about $125,000, and will be used for the manufacture and storage of knitted goods. The company expect to be able to occupy it next year.

A considerable increase in capacity is the natural result of this addition, but as the extent of such an increase depends largely on the available supply of labor, an exact estimate of it cannot yet be made.

Underground Power Shovel

The Canadian Mine Shovel Company, Limited, are Making the Hoar Underground Shovel

The Canadian Mine Shovel Company, Limited, are a company incorporated with an Ontario charter to manufacture, buy and sell tunnelling machines, mechanical shovels or loading machines. The main product is to be the Hoar Underground Shovel, the patent of which in all countries but the United States is controlled by the Canadian company. Heretofore there have been three major difficulties attending the use of power shovels in mining. First, there is a limited working space in a mine drift; second, there is usually lack of room in both shaft and drift for moving a power shovel easily; and third, in many cases there is a necessity for quick and frequent changes in the seat of operations. The company claim that the Hoar shovel will meet these difficulties. It is built on the same general plan as the steam shovel used in surface operations, but uses air for underground power.

The company had hoped to have the first shovel ready for the Canadian National Exhibition, but unforeseen delays prevented this. When the machine is completed, and the company are satisfied that it complies in all respects with the plans, orders will be filled as rapidly as possible.

The authorized capital of the company is $100,000. The officers are:—President, Captain Samuel Hoar; vice-president, C. E. Hendricks; secretary-treasurer, W. J. Schutze; directors, J. A. Sabin and Charles B. Lamond, M.D. The machine is at present being built by the steel works at Port Arthur. The head office of the company is at 202 Lumsden Building, Toronto.

A Growing Business

The Lennox Knitting Mills, Limited, Plan Addition to Plant and Increased Output

The Lennox Knitting Mills, Limited, have a modern plant at Lennoxville, Quebec, where at present they specialize in the manufacture of worsted half hose. Their efforts in this line since their incorporation last year have met with success and next year's programme calls for an addition to the plant, so that long worsted hose in sizes six to ten can be made, and half hose machinery will be added to increase the present production 50 per cent. Larger premises will be required to take care of the increasing business.

The company are capitalized at $75,000, and the officers are: President, H. V. Haight; vice-president, H. L. Allen; treasurer, N. D. Carscadden; secretary and manager, P. G. Newhold.

Plans and Estimates Prepared for Cafeterias of any size

Sectional view Economy Ferrule-type Fuse and Economy "Drop Out" Renewal Link

ECONOMY *renewable* FUSES

Sectional view Economy Knife-blade Fuse

Consider the Fuses in YOUR Plant

Proper protection of lives, property and machinery in all industrial plants using electrical energy depends upon the accurate functioning of the fuses used.

Economy Fuses are absolutely accurately rated. They operate unfailingly when overloads, short-circuits and lightning discharges cause hazards to lives, apparatus and property.

Nothing is destroyed but the inexpensive strip of fusible metal—quickly and easily replaced by a new Economy "Drop Out" Renewal Link.

This feature cuts annual fuse maintenance costs 80% as compared to the use of one-time fuses.

Avoid production delays; it requires but a minute to restore a "blown" Economy Renewable Fuse to its original efficiency.

Instruct your electrician to install Economy Renewable Fuses at once.

Change of Ownership

Montreal Interests Purchase Dryden Pulp and Paper Company From English Owners

The English owners of the Dryden Pulp and Paper Company, Limited, a large producer of kraft pulp and paper at Dryden, Ontario, have sold it to Montreal interests, retaining their holdings of $1,500,000 six per cent. bonds now outstanding. The reason for the sale, it is stated, is that owing to various causes, including the exchange situation, the English interests have not been willing to provide the capital necessary to complete the plant. A new company is being formed by the Canadian interests, who will develop the plant to the capacity originally intended. On the understanding that this was to be done the purchasers were able to acquire the mills at approximately the pre-war valuation.

A large amount of pulpwood is available from the Dryden Company's limits which comprise 1157 square miles in the Kenora District of Ontario, adjacent to Lake Wabigoon and Eagle Lake. It is understood that the directorate of the reorganized company will include W. A. Black, J. B. Beveridge, J. N. Greenshields, J. H. A. Acer and Senator Lorne C. Webster.

Twist Drill Company

Canadian Branch of Detroit Twist Drill Company is located at Walkerville, Ontario

Under the name of Canadian Detroit Twist Drill Company, with a capital stock of $20,000, the Detroit Twist Drill Company have incorporated a branch business to manufacture drills, reamers and milling cutters at Walkerville, Ontario. Work in connection with equipment and organization is proceeding rapidly, and the company expect to start manufacturing their products at an early date, with a force of thirty men. The personnel of the Canadian company is as follows:—President, Muir B. Snow; Vice-President, Lewis H. Jones; Secretary, P. C. Hill; Manager, R. A. B. Goodman; Superintendent, George Johnson.

Pulp and Paper Machinery

Modern Patents Company, Reg., are to Establish Plant at Grand Mere, Quebec

The Modern Patents Company, Reg., are a registered society under the laws of Quebec, organized to manufacture pulp and paper machinery and pulp pressing mats at Grand Mère, P.Q. At the present time a site has not been found and plans for the plant are still under way, so goods are being manufactured by the parent company in Montreal. Operations commenced in March last with the manufacture of machinery and the manufacture of mats will commence in a short time.

New Textile Plant

Otonabee Mills, Limited, Have Purchased One Building and Are Erecting Another

A new industry for Peterborough, established by two local men, J. L. Hopwood and W. G. Worth, is the Otonabee Mills, Limited. The company have purchased and fitted up a two-storey building 30 x 58 feet and are erecting another plant with two storeys and basement, 41 x 30 feet. When the necessary mechanical equipment has been installed the mills will begin spinning and preparing yarn for the market

Protect Your Plant With The Eddy Fire Pail

The Eddy Indurated Fibreware Fire Pail is just the right pail for the purpose---strong, light, clean and durable---a pail that's always where you want it when you want it. Its rounded bottom assures it being placed upon its rack or on its hook---it will not stand alone.

Leak-proof, bulge-proof and impervious to acids. No staves to loosen or hoops to fall apart. An ideal fire pail in every respect.

Your dealer can supply you.

Addition to Body Plant

Fisher Body Company of Canada, Limited, Build $275,000 Addition at Walkerville, Ontario

A four-storey addition is being made to the plant of the Fisher Body Company of Canada, Limited, at Walkerville, Ontario, and will be completed about the end of the year. The new building is of heavy mill construction and will have 75,000 square feet of floor space. It will be used for painting and trimming closed automobile bodies. When it is in operation the capacity of the closed body department will be increased about 80 per cent. The estimated cost of the addition is $275,000.

Buildings Completed

Britannia Wire Rope Company are Now Installing Machinery in Granville Island Plant

The Britannia Wire Rope Company, who are a branch of the English Company of the same name, have recently completed their buildings on Granville Island, Vancouver, B.C., and are now installing the necessary machinery for "laying" various types of wire ropes for the Canadian market. While the wire for making the rope is being imported from England for the present, the company intend eventually to bring in their own steel and draw the necessary wire at the Granville Island plant. Similarly, skilled workers are being brought over from Great Britain at first, but local men will be trained in "laying" wire ropes as soon as possible. About fifty hands will be employed when operations are commenced.

The managing director of the new company is Robert Gibson, of Vancouver, who has been connected with the logging equipment business in British Columbia for several years. A the logging industry will offer the largest part of the marke for wire rope. Mr. Gibson's knowledge of the requirement will contribute largely to the company's success.

Pulp and Paper

Manouan Pulp & Paper, Limited, Incorporated to Develo Timber Limits on St. Maurice

Manouan Pulp & Paper, Limited, are a company, r cently incorporated in the Province of Quebec, who intend develop timber limits on the St. Maurice River. Accordi to the Atlas Bond and Security Corporation, Limited, wh are the financial agents of the new company, there is enou timber available from these limits to supply a 100-ton mi for about sixty years. They are well situated, adjoinir limits owned by the Laurentide Company, the Belgo-Canadi Pulp Company, and the Brown Corporation. They have nev been cut over.

It is proposed to acquire a power known as "Alla Falls," on the St. Maurice above La Tuque, from which abo 38,000 h.p. can be developed, and also a mill site of sor 1,600 acres at the same location. About 9,000 h.p. will satis the present needs of the proposed 100-ton ground wood mi

The authorized capital of Manouan Pulp and Paper $5,000,000, of which $4,000,000 is to be issued. The directo include Frank L. Moore, president and managing director the Newton Falls Paper Company, Watertown, N.Y.; Thom Fynes, treasurer of the Continental Paper Bag Company New York, and an official and director of many pulp a paper companies in Canada and the United States; T.

You Should Have This Book!

IT tells the story of Diamond Fibre—a raw material that is playing a big part in the world's serious problems of to-day—a raw material that is tougher than most metals yet lighter than aluminum. A basic material—not a substitute—high in tensile, shearing, dielectric and compressive strength—and equal to any machining process.

Every business man, engineer, manufacturer, purchasing agent or shop superintendent — in fact every one interested in manufacturing processes of any kind—should have a copy of this interesting book and should know all about this most unusual material. Get your copy now. Sign and send us the attached coupon. We will send you the book gladly by return mail.

Making Insulated Wire

The Live-Wire Company, Limited, Turning Out Thirty Thousand Feet of Wire a Day

The Live Wire Company, Limited, are a firm, incorporated under a Dominion charter, who are now manufacturing rubber-covered insulated wire, National Electric Code standard, in Guelph, Ontario. All wire made by this company bears the underwriters' label, and the estimated daily output is from thirty to thirty-five thousand feet. From twenty to twenty-five hands are employed. F. E. Partridge, president of the Partridge Rubber Company, Limited, is also president of the Live Wire Company, and John Kennedy of the Standard White Lime Company, Limited, is vice-president.

Million-Dollar Output

The D'Allard Manufacturing Company, Limited, Make Blouses and Operate Chain of Stores

The D'Allard Manufacturing Company, Limited, are now employing two hundred and sixty-five hands in the manufacture of ladies' waists at their plant in Montreal. This factory is a building 80 ft. by 75 ft., four-storey and basement, of solid cement construction, built on the daylight plan. It is used exclusively for the manufacture of blouses, and is located at the corner of Laurier and Clarke streets. The value of the annual output is estimated at one million dollars.

The present company was organized this year with an authorized capital of $500,000 of which $298,600 is paid up. The officers are: President, George J. D'Allard; secretary, B. S. Connolly; treasurer, William C. Burpe; directors, Mrs. C. D'Allard and Miss H. Choquette. Besides manufacturing, the company operate a chain of twenty-one stores, which are the sole outlet for their product. These are located in all large Canadian cities from Halifax to Victoria.

A New Sawmill

McGibbon Lumber Company Replaces Burned Building With Modern Metal-Sheeted Mill

The new sawmill of the McGibbon Lumber Company, Penetanguishene, Ontario, is described in a recent issue of the *Canada Lumberman and Woodworker*. The old mill was burned down last October, and in spite of the severe winter the company managed to build the new mill and start cutting on July 3rd. It was erected under the supervision of James Warnock, an expert millwright and mechanic.

The foundation is concrete on piles. The lower storey is built on 12 x 12-inch pine and the upper storey on 8 x 8-inch timbers with a filing room on the third floor. The mill has been made as fireproof as possible, and is whitewashed throughout, with hydrants upstairs and downstairs. The whole structure is metal sheeted and will cost, with equipment, about $100,000.

The mill has a heavy double-cutting Waterous band saw, Waterous carriage and Mershon resaw. The installations are up-to-date in every respect with slash table, modern trimmers and lath mill. The capacity is about 60,000 ft. of long lumber per day, and 40,000 pieces of lath in ten hours. The power-house consists of three 72 in. x 18 in. Goldie & McCulloch boilers, carrying 125 lbs. of steam. Dutch ovens are installed and the power is supplied by a 28 x 38 slide

The Canadian Appraisal Company

Limited

The Pioneer Appraisal Organization of Canada

ESTABLISHED 1905

THE Canadian Appraisal Company, Limited, has now completed fifteen years of service and enjoys to-day an unrivalled position as an Appraisal organization amongst manufacturers as well as insurance and financial houses within the Dominion.

Approximately 4,500 properties have been appraised by us to date. Amongst these are the most representative industrial concerns and those which are "a household word" in practically every line of manufacture; including also all the properties comprising the recently formed "British Empire Steel Corporation, Limited."

We are therefore able to offer to clients the very best Appraisal Service that is to be obtained, yet one which it is our constant ambition to improve and perfect by every means in our power.

valve engine. The boiler-house is constructed of concrete and brick. The lumber is taken out on cars 12 ft. high and requires three gangs of pilers.

The McGibbon Lumber Co. have a stock of logs amounting to 150,000 pieces, which they will not be able to finish cutting this season, but they look for an early start next spring. The production of the mill this year has been sold to the R. Laidlaw Lumber Co., Toronto.

To Triple Capacity

Magnolia Metal Company of Canada Add $25,000 Building to Their Montreal Plant

A new building, the estimated cost of which is $25,000, exclusive of equipment, is being added to the Montreal works of the Magnolia Metal Company of Canada. The company report an increasing demand for their products, and state that the new building will meet this by tripling their productive capacity. The addition will be completed, it is hoped, early in November.

Paper Mills Expand

Expansion at Iroquois Falls Plant of Abitibi Power and Paper Company, Limited

Alterations and expansions are now being made at the mills of the Abitibi Power & Paper Company, Limited, Iroquois Falls, Ont. When these are completed, probably about next May, the plant will be approximately double its present size. One of the more important improvements is the rebuilding of the barking drum plant and the installation of four additional drums. The combined daily capacity when the new units are in operation is estimated at 500 tons newsprint paper, 175 tons ground woodpulp and 65 tons sulphite pulp.

B. C. Cordage Plant

Canada Western Cordage Company, Limited, Are a Veterans' Organization in New Westminster

With the formal taking over by the Veterans' Company of the buildings of the Canada Western Cordage Company, unless some unforeseen obstacle occurs, it is expected that within a very short time this company will begin actual manufacturing. The authorized capital of the new company is $300,000; the present capital investment amounting to $201,788, $96,788 of which represents buildings and the balance machinery and equipment. The site of the new factory adjoins the City of New Westminster and comprises 7 acres, which was donated to them by the city with ten years' tax exemption.

The annual consumption in British Columbia alone of cordages of various descriptions is estimated at 2,400,000 lbs., but it is expected that the new plant, which will have a capacity of about five tons per day at the commencement, will be able to compete successfully in the Middle Western Canadian markets.

the company in an advisory capacity and other directors and members of the Williams, Greene & Rome staff are to retain their positions with Cluett, Peabody & Co.

Since the purchase of the Williams, Greene & Rome Company, the following Canadian board of directors has been appointed:—President, G. A. Cluett; Vice-President and Managing Director, F. W. Stewart; Vice-President, F. S. Hodgins; Secretary, A. E. Cluett; Treasurer, A. Gillespie; Directors, E. H. Cluett, C. A. Culver, C. S. Dean, G. I. Miller, F. R. Caldwell, J. B. Kirby, Lorne Nash, B. K. Robinson, H. K. Elliott.

Large Sherbrooke Industry

Canadian Peerless Jewelry Company Have Annual Output Valued at $825,000

The Canadian Peerless Jewelry Company are an organization incorporated last year to manufacture a general line of jewelry ranging from gilt to fourteen karat gold. These companies, the Peerless, Standard and Allen Gold, were acquired by purchase at the time of incorporation, and their factories were combined into a plant at Sherbrooke, Quebec, which last year had an output valued at $825,000. The company hope to increase this figure for the present year's business.

The policy of the company has been to bring from the United States expert workmen who educate local labor to do the required work. The average number of employes is 300, varying a little above or a little below that figure, according to whether the season is busy or slack. The prospects of the business are good, for in addition to filling the Canadian demand for their wares the company have been able to engage in some export trade. In this latter field a considerable expansion is planned.

Another department of the industry is a box and card department that takes care of the company's own requirements first and then fills those of their customers.

The business was originally started in 1907 and has reached its present magnitude from a comparatively small beginning. At present the principal officers are: A. A. McRae, D. C. McRae, C. P. Keeler and H. M. Holbrook, who are president, vice-president, treasurer and secretary respectively. The authorized capital is $1,000,000.

A Toronto Company

Canadian John Wood Manufacturing Company, Limited, Making Steel Boilers and Tanks

With a plant consisting of four metal-clad factory buildings, of which the largest is 100 ft. by 300 ft., together with boiler-house, gas-house and outbuildings, the Canadian John Wood Manufacturing Company, Limited, are now carrying on a manufacturing business at Toronto. The company are capitalized at $300,000 and have been making welded steel range boilers and tanks for the past six months. Approximately 1,300 pieces a week are produced.

Some seventy-five hands are employed by the company. Frank Sutcliffe is president of the firm and Frank C. Hamilton is vice-president and general manager.

To make "Tosox" and knitted wearing apparel, the Hall Knitcraft, Limited, have a two-storey factory at 126 Garden Avenue, Toronto. At present sixteen hands are employed, but this number is being gradually increased. The company are capitalized at $100,000.

Quality

CONFIDENCE

THE GREATNESS OF BRITAIN IS FOUNDED ON HER INTEGRITY.

HER STRENGTH SHE DERIVES FROM WORLD COMMERCE—HER ENDURANCE FROM CONFIDENCE.

THE WAR TEMPORARILY RETARDED HER CONSTRUCTIVE EFFORTS, BUT THE POWER OF THE CONFIDENCE OF THE PEOPLES OF THE WORLD WILL RESTORE TO HER IN MORE BRILLIANT FORM THE LEADERSHIP SHE HAS JUSTLY EARNED AND PROUDLY HELD.

CONFIDENCE IS THE FOUNDATION OF OUR POSITION IN THE WORLD OF IRON AND STEEL—OUR PROGRESS DEPENDS ON IT.

WE HAVE BEEN SUCCESSFUL IN THE PAST—THE FUTURE IS BEFORE US. TO ADVANCE, WE MUST CONTINUE TO MERIT THE CONFIDENCE OF THE BUYERS OF STEEL AND IRON PRODUCTS OF EVERY DESCRIPTION IN CANADA, AND WE ARE DETERMINED TO ADVANCE.

The Canada Metal Co., Limited
HAMILTON MONTREAL **TORONTO** WINNIPEG VANCOUVER

The British Columbia Department of Industries have recently granted the loan of a considerable sum to the Canadian Abrasive Company, Limited, under the management of Mr. J. L. Near, to assist in financing the construction of a factory in the vicinity of Vancouver for the manufacture of abrasive papers.

J. B. Jardine, of Vancouver, has recently purchased a water-front site at Departure Bay, in the outskirts of Nanaimo, and is preparing to erect a large fish oil and fish meal plant there. The factory buildings and wharf will represent an outlay of about $20,000, and the necessary machinery to be installed will cost approximately half that amount.

Two more distribution depots for oxygen and dissolved acetylene have recently been opened by L'Air Liquide Society at Quebec and Ottawa.

The Matane Lumber and Development Railway has sold all its assets, real and personal, to the Hammermill Paper Company of Erie, Pa. The deal, which involves several millions of dollars, includes the acquisition of timber lands, mill site, river improvements, etc., lying on the rivers Matane and Cap Chat on the south shore of the St. Lawrence, comprising an area of 133,000 acres. The company will commence its fall and winter operations on the new property immediately. Their present intention is to use these lands merely as a source of pulpwood supply for their Erie mills.

The farmers of Saskatchewan have invested approximately $6,000,000 in new tractors this year according to estimates made by prominent implement dealers in Regina. It is stated that roughly two thousand new tractors have been turned over to purchasers in the province during the 1920 season at a cost averaging $3,000 each. As the cost of labor rises farmers are coming to depend more and more upon mechanical contrivances.

Great activity prevails in Medicine Hat industrially as well as argriculturally. The brick plants and the Dominion Glass Company are doing business in excess of 1919, while the flour mills expect increased flour shipping in view of the tremendous crop. The mills state that they have already sufficient orders on hand to keep the plants in operation until the end of the year.

Natural gas has been struck at Ponoka, Alberta, in a well drilled by the Provincial Department of Public Works at a depth of 2,600 feet. A pressure of 625 feet has been registered and prospects for a good flow are considered hopeful. If the pressure maintains itself the gas will be used for heating, lighting and power services at the provincial asylum there, entailing a saving of $30,000 annually.

Fire recently destroyed the plant of Hawboldt Gas Engines, Limited, at Chester, Nova Scotia. The estimated loss is between $30,000 and $40,000.

The warehouse of Doon Twines, Limited, at Kitchener, Ontario, was completely gutted by fire and the entire stock destroyed at a loss of $100,000.

Practical Service—The Result of a Well-Balanced Organization

From time to time we have brought to your attention examples of building construction which have been entrusted to our care, with results of which we are justly proud. Achievements of this kind require a guiding hand at every step of their development, so we have built up an organization carefully selected to ensure the carrying out of your plans perfectly in every detail.

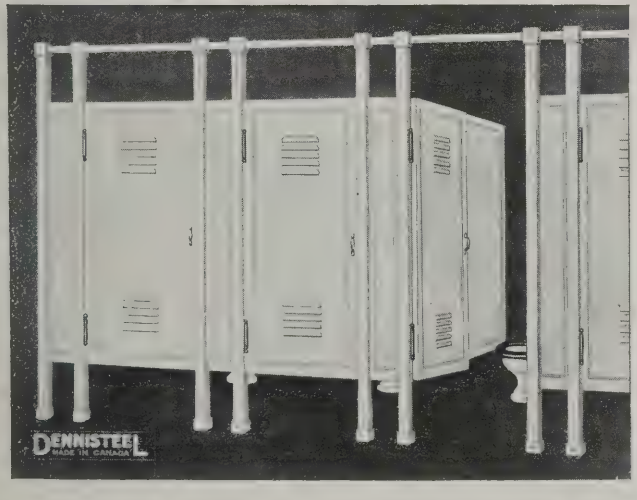
MANAGEMENT by practical men of long experience in all phases of the construction business, assisted by an engineering staff chosen for their special knowledge of building construction.

A Field Organization of superintendents and foremen, who are not only job executives of the highest order but have all proved their ability as mechanics in their individual trades.

A Purchasing Department, with close connections with producers direct with an established credit facilitating purchase of materials at rock bottom prices.

An Estimating Department, working under a carefully planned checking system, guaranteeing accurate quantities and by close co-operation with the special cost staff ensuring accurate unit costs on each individual contract.

Unity of purpose throughout to furnish the best possible building at the lowest possible price is the basis on which we have built an enviable reputation for "repeat" contracts.



We are interested in your construction problems, large or small, and the resources of our organization are at your disposal for their solution An interview does not commit you in any way.

INDUSTRIAL KITCHENS

The furnishing of equipment for Industrial Kitchens is a specialty of McCLARY'S. Every detail, and there are many, has been mastered by our experts; large or small, complicated or straightforward specifications, are handled with equal care.

During the past few years we have had a large experience in this class of work. Architects and buyers of this equipment have proved to their entire satisfaction that McCLARY'S activities are not solely confined to the manufacture of Good Stoves and Cooking Utensils.

The development of the Cafeteria or Cafe for industrial organizations has been very rapid of late. Employers of labor realize that this system of having pure, healthful food available for sale at reasonable prices, right within convenient reach, is very beneficial to the moral of their workmen.

It is not sufficient, however, to merely approve the establishment of this new departure: it is very essential that no risks should be taken in its satisfactory installation.

It is with perfect confidence that we, McCLARY'S, offer our services to any architect or buyer who desires to obtain specification, layouts and prices without obligating himself. Our experts are ready at any time to give their personal and courteous attention to any enquiry submitted.

Our nearest branch will deal promptly with a written request.

Trend of the Market for Clothing

By GEORGE H. DOUGLAS

Thornton & Douglas, Limited, Hamilton

I AM afraid that the press of the country has given a ver wrong impression to the public regarding the trend prices of clothing.

No one would welcome lower prices more than the cloth ing manufacturers, as present prices have necessarily had th effect of curtailing business.

It can easily be shown that the effect has been to cut th production of garments to less than one-half compared to pr war conditions. But the question naturally arises, how lon can this continue? People have been exhausting the reserve in their wardrobes and cannot much longer refrain from r plenishing. Under the circumstances it would seem impossibl that the clothing market will be overstocked, but rather tha a shortage is quite possible, when you consider the crop con ditions throughout the country, which are conceded to be no only one of the best crops, but the best distributed cro Canada has ever produced.

The false impression would appear to be occasioned by drop in the price of raw wool and cotton, but when you con sider the very small part of the cost of a man's suit this r presents, it will be observed that it can have but a slight in fluence on clothing prices. Further, all supplies and equip ment (excluding labor, which I will refer to later), such a buildings, plant and machinery, fuel, freight, taxes, etc., ar all costing more.

This brings us to a point where sound reasons must b sought to base arguments on.

The basic articles from which a suit of clothes is pro duced consist of about five to six pounds of raw wool un scoured, to produce three to three and one-half pounds in th fabric, some raw cotton and a small quantity of flax, all o which have very little value, and labor enters very largel into what value it has.

The sheep rancher employs labor; the raw wool is tran ported to the world's market by labor, on ships produced b labor, largely from timber in the forest and ore in the min which have very little value until labor enters into it; th wool is then converted into yarns by labor, on machine produced by labor, then woven into cloth by labor, on machi ery produced by labor, and so on until it is ready to b marketed in the form of wearing apparel.

Is this not the history of all articles of commerce? If s how can prices go down when wages are going up?

Prices of woollens in Great Britain for spring, 1921, whic were much the highest ever known, were in many instance quoted subject to further advances for labor, and since the labor has had substantial advances, and this is in the world market for woollens for men's clothing.

Every operation from the raw material to the finishe garment is receiving from two to three times, and in son instances much more, in payment than under old condition In other words, $5.00 is now paid in wages for shorter hour in any cases 20 per cent. and much less production p hour that formerly cost $2.00. It should, therefore, be evide that labor is the prime factor in to-day's cost. It will al be admitted that there has been some profiteering by man facturers and merchants, but there can be no difference b tween the worker who sells 50c. worth of labor for $1.00, a the merchant who sells 50c. worth of merchandise for $1.0 Both are enemies of the public, and the shortage in the mark has enabled both to take this advantage, but it will be o served that present methods will not create a surplus of pr ducts which alone will correct the abuse referred to.

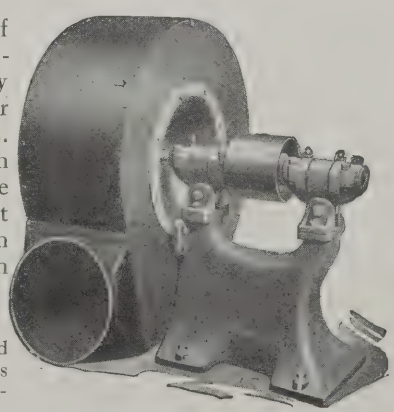
will keep your shop clean, remove sawdust, shavings, fumes, gas, or any loose materials, and disagreeable odors. Insurance rates can be reduced. Floors and machines covered with sawdust, chips, or shavings, increase the fire risk. Insurance companies reduce the premiums where adequate precautions have been taken to prevent fires.

BLAST WHEEL—



This wheel is so constructed that it will handle any kind of stringy material efficiently—such as sawdust, shavings, cotton lint. Will also handle gases, fumes, smoke, etc.

The Canadian Standard Planing Mill Exhausters have reversible housings, so that the outlet can be adjusted instantly to any angle desired. This eliminates necessity of crossed belts. Simplifies changes on alterations in piping or building.

The housing is of heavy rolled steel-plate securely bolted together with angle irons. Round cast iron outlet bolted to the housing. Blast Wheel mounted on heavy cast iron spider.

Every fan carefully tested by running test at speeds in excess of that required.

Write for Catalog 410-14

Canadian Blower & Forge Co.

KITCHENER, ONT.

Contracts for woollens and lining for fall, 1921, will be made in about two months' time, when it is anticipated some reductions in prices will obtain, but British manufacturers hold out little hope at present.

Some reductions are now being quoted in the United States market, but it should be remembered that it has been the highest market for some time, and it will be several months before woollens, now being quoted by manufacturers, will reach the consumer.

Canadian-made woollens are to-day the cheapest in the world, but, unfortunately, the production is only a small part of our requirements.

I cannot see, therefore, how any substantial relief, generally speaking, can reach the consumer for another year at least.

Extent of C. P. O. S. Services

Number of Ships, Tonnage and Ports Between Which Sailings are Provided

At the present time Canadian Pacific Ocean Services, Limited, are operating seven steamships between Montreal and Quebec and Liverpool (summer season) and West St. John and Liverpool (winter season), giving shippers the advantage of bi-weekly sailings. These are the Empress of France, 18,481 registered tonnage; Empress of Britain, 14,189 tons; Minnedosa, 14,000 tons; Melika, 13,967 tons; Metagama, 12,420 tons; Corsican, 11,419 tons, and Victorian, 10,635 tons.

Between the same Canadian ports and London, they are operating the Scotian, 10,322 tons and the Tunisian, 10,576 tons. On the Glasgow run, they have the Pretorian, 7,649 tons, and the Sicilian, 7,328 tons. Sailing to Antwerp, they have the Grampian, 10,955 tons and the Scandinavian, 12,099 tons, and to Havre, the Scotian, 10,322 tons, and the Tunisian 10,576 tons. All these ships give fortnightly sailings.

In addition the C.P.O.S. are operating eight cargo vessels which are inter-changeable in freight services, according as conditions require from time to time. These are at present supplying weekly services to London, fortnightly to Antwerp and monthly to Avonmouth, Glasgow, Rotterdam and Hamburg. The sailings to Rotterdam and Hamburg are the latest additions to the company's services.

As agents for the Norwegian American Line, the C.P.O.S. are operating a monthly service between Montreal (summer), St. John (winter), and Norwegian and other Scandinavian ports. So far they report that this service has not had the support expected in Canadian export trade, and the service has been maintained with full cargoes of grain and flour largely originating in the United States.

The company's Pacific service supplies fortnightly sailings between Vancouver and Yokohama, Kobe, Nagasaki, Shanghai, Hong Kong and Singapore. It is furnished by the S.S. Empress of Asia, 17,000 tons; Empress of Russia, 17,000 tons; Empress of Japan, 6,000 tons; Monteagle, 6,000 tons; Mattawa (freight only), 4,874 tons, and Methven (freight only) 4,852 tons.

In the $10,000 prize contest recently conducted by the manufacturers of the "Everready Daylo," hundreds of thousands of replies were received. They were sent in from all parts of Canada and the United States and from several foreign countries. It is expected that the judges, the art editors of *Life*, will require at least three months to select the 104 prize-winners.

Making Employees 100 Per Cent. Efficient*

By A. A. BUREAU

Manager Industrial Relations Department, Morris & Co.

ONE of the great problems to-day before the industrial committees of big industry is the finding of the exact place physical examinations should occupy in the selection of employees. In the past we have hired men upon the basis of education or skill. In this day, when physical examinations (army and industrial) are so common, we are beginning to realize that there is still another great factor in the hiring and placing of men. A man's mental alertness, soundness of judgment, or efficiency and skill in his trade depends, to a large extent, upon his physical condition. A man in poor health is like a dirty machine. He cannot make his body respond quickly in the face of impending danger. Also, he cannot do his best regardless of how good the working conditions may be. As to safety, an abnormal man is never 100 per cent. mentally or physically alert. As such, he decreases the safety of his fellow-workers. Accidents are costly misfortunes, both in human suffering and cold cash. As to efficiency, anything less than his best is a decrease in the production of that department. The loss in production caused by the physical health of one man, when multiplied by many such men, soon can make a marked difference in the total amount of production for the plant. Therefore, the physical condition of the employees is an important factor; first, in the reduction of accidents, and second, in the cost of production.

Physical Examination Department.

Looking upon physical examinations as one means of controlling the number of accidents and the cost of production, I believe that the place of the physical examination department shall be looked upon more and more as an absolutely essential part in any well regulated industrial organization. Also there will, as time goes on, be more emphasis laid upon the grading of workers as to their physical fitness to perform the work of the particular job for which they are hired. In industries where there are no physical examinations, they will be required, and in industries now conducting such, the work will be done with more care and precision.

Physical examinations as now conducted in army, civil, or industrial life, are to keep out the physically unfit from that particular organization. The army refused the imperfect man, the life insurance company rejects the poor risk, and the industrial organization turns down the man liable to be injured at his work. Then we have the just passable class in industry which may be in the unfit class of to-morrow. Our physical examinations accordingly, in the future, must take on a broader scope—in other words, if they are to serve the community and industry as a whole they must build up some form of reconstruction work to be followed among their employees.

In this brief introduction, we have seen the reasons why physical examinations have a place in industry, a glimpse of what their future must be, and a birds-eye view of their present status.

Now let us examine step by step how we provide for the safety of our employees in the elimination of the unfit and in our medical reconstruction.

The first step in the elimination of the unfit takes place in the employment office. It is the duty of the employment

*Address delivered before the Ninth Annual Safety Congress, Milwaukee, October 1st, 1920.

Steel for Permanence

The All Steel Elevated Water Tank is the most economical installation for Automatic Sprinkler systems for fire protection, general mill supply, or Municipal Water Works systems.

Its first cost is not excessive, the maintenance expense is very low, and there is no danger of leakage, falling ice, or possibility of the tank bursting or catching fire.

Hundreds of our All Steel Elevated Water Tanks now in service throughout Canada bear witness to these facts.

OUR PRODUCT IS MADE IN CANADA

manager to hire those he deems good risks of industry—that is, men who have the necessary strength and energy to safely perform the duties of the jobs open, and to pass up the run-down and physically unfit otherwise. This may seem a divergence from the subject, but it is a very important step and must not be overlooked. The doctor's office is not then made a weeding-out station. The doctor must ever stand as the friend of the plant workers. In fact, he must take the place of the employer, as the caretaker of his injured employees. In the olden days, in case of accident, the boss went personally and looked after his hired man. But the times and conditions have changed with the rise of big industry. In his examinations, the examining physician must stand as a reconstructionist, if confidence is to be placed upon his advice for the physical upbuilding of the one examined. If the doctor's office is seen as their true friend in the time of their physical disability, there can be no more powerful influence in the getting of the good will of the employees. Therefore, the doctors should be called upon to reject very few men, in fact, only in case the disabilities are hidden. The employment manager must be held strictly accountable for the class of men he hires. It makes a much better impression with labor to pass up a man than to have him rejected because he cannot come up to the company's set rule. Under no circumstances should the employment man be allowed to pass the buck to the doctor's office for the rejection of all the unfit.

Test for Fitness.

After the hiring of the applicant ultimately comes the physical test for fitness. The examinations may be conducted immediately and before the man goes to his job or after he has been on his job for a few days. We examine our men after they have gone to work. Several obvious reasons present themselves for this procedure. First, it is easier to induce the men to go to work. They do not have ever in their mind that immediately following the acceptance of the job they will have to be subjected to a physical examination—a thing ever repulsive to the workers. This way they will be given a chance to see if they like their job and want to stay with it. Our experience is that the men don't mind the physical examinations so much after they are hired. In fact, a refusal is a rare thing. These are usually among the ignorant whites.

Second, the examinations can be made more thoroughly and will be of greater benefit to the employees. Our big hiring day is Monday. The rest of the week is slow in comparison. Thus, if the doctor had to examine all of Monday's applicants on Monday, he could do nothing else but give them a very superficial examination. In very few cases could he actually take time to give advice. If the doctor has more time, he can advise each one personally. Also, he will have only as many as he can handle by calling the applicants from their work.

Third, examinations on which the doctor can spend time and give adequate counsel create loyalty to the company, and give the man a view that the company doctor is a real friend, not one who does just as little as possible because he is a company doctor.

The calling of the men up to the doctor's office is an ordinary matter of routine. First, the time office furnishes a list of the additions, transfers, and take-offs from the payroll to the examining physician's clerk. Then he makes up a list of the men required for examination. The record card of those transferred is automatically renumbered and refiled. The record cards of the take-offs are removed from the live file and placed in the dead file. The list of the unexamined is sent to the different foremen by a messenger boy

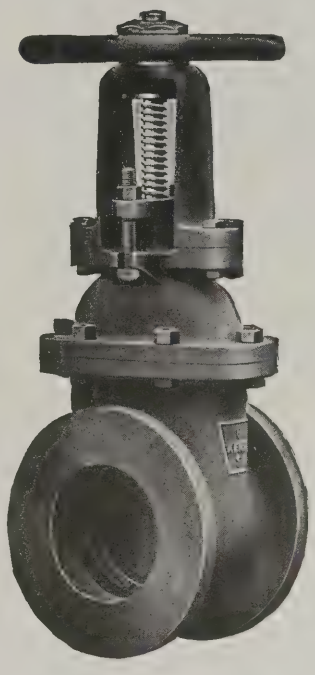
METHYLATED SPIRITS
(Denatured Alcohol)

CANADIAN INDUSTRIAL ALCOHOL COMPANY LIMITED

DURING the last session of parliament, the Inland Revenue Act was amended so that the sale of Methylated Spirits (denatured alcohol) is no longer controlled and carried on by the Department of Inland Revenue.

Our Distillery at Corbyville, Ontario,—the largest Industrial Alcohol plant in the British Empire—is fully equipped and thoroughly organized to serve manufacturers who use Methylated Spirits or Denatured Alcohol.

We will be pleased to place at your disposal the advice of our chemists in regard to the use of specially denatured alcohol. One of these formulas may prove more suitable in your business than that which you are now using.



We also manufacture Ethyl Alcohol, Cologne Spirits, Fusel Oil and Non-Potable Alcohol.

All orders received by us will be given the prompt and careful attention that only an organization such as ours can give.

who goes to each and notifies him of the men he is to send to the doctor's office that day. The foreman gets a duplicate copy of the list and puts his name on the original list to show that he has been duly notified, and he is thus held responsible for sending those men to the examining room that day as he can spare his men. With each man is returned an O.K. card to show the foreman that the man has been to the doctor's office, examined and accepted.

Method of Examination.

The examinations are conducted more or less on the army style. We have the applicant remove his clothing. Every irregularity is diagnosed and noted on his record card. The examinations are thorough in every respect. Then at the bottom of the card we note our opinion of the safety risk and fitness of the applicant.

During the month of July we made some rather broad studies of our physical examination findings, based upon the record cards of 855 men. It rather startled us at first to find so many defective men; however, in a study made by a life insurance company, it reported only a little over two per cent. of the men they examined were found perfect. Out of this 855, we found sixty-eight men, or 8 per cent. had some defect of the hand or arm, such as amputated fingers, stiff joints, rheumatism, cut tendons, etc. Thirty-three men, or approximately 4 per cent., has some defects of the feet, as bunions, deformed toes, amputations, etc. Fifty-eight men or about 7 per cent. possessed some varicose veins which, in most cases, are not now serious but will, in old age, be a very serious annoyance. Two hundred and sixty-two, or 30 per cent. were afflicted with flat feet. This includes from slight to extreme flat feet. One hundred and fourteen men or 13.4 per cent. had some form of organic heart disease. Seventy-seven, or 9 per cent., possessed a hernia, either umbilical, single or double inguinal hernia. Seventy-six men or 9 per cent., had piles. Nine men, or 1 per cent., were found to be blind in one eye. Taking 20/40 as a basis for poor vision, sixty-five were found to have poor vision in one eye, and ninety-seven, or 11 per cent., to have poor vision in both eyes. Also we found sixteen other defects of the eyes such as strabismus, cataracts, nystagmus, ulcers of the eye etc. Six men were found with some form of venereal diseases. In most of the cases, the defects were minor and did not affect the efficiency of the worker to any great extent. However, they make him liable to accidents.

Percentage of Defects.

In a more recent examination at our car shops of one hundred and eighty-two men, we found fifty-five defects, which made the men employed in a more or less risk to the company. Of this number of men we classed one hundred and forty-two men as good safety risks. Thirty-four men as fair safety risks—that is, they were passable, and six were classed as poor risks, or below the standard to be employed.

The causes for which we reject men are: First, contagious diseases of various sorts, such as venereal diseases, tuberculosis and skin rashes and eye diseases. Second, poor safety risks. This includes those who are more or less a safety risk to the plant, endangering their own well-being or that of their fellow employees. In this class are hernias, very poor vision, paralysis, fits, and the like. When possible, we place this class of men in positions that do not require the same energy or strength as the ordinary job. Third, the physically undesirable, those who should not work at some particular class of work. This includes the weak-lunged in the fertilizer or hair house, rheumatic people in the pork room, tripe room, freezers, where there are wet and cold

conditions. In most of these cases we try to find something else open in our plant where this individual may work without injury to his health.

Our physical reconstruction work may be divided into three different classes: First, medical advice (*a*) advice regarding simple medical treatment which they can do for themselves, and (*b*) advice as to the work which they can and cannot perform to their physical well-being. Second, medical and surgical aid. Third, advice and instruction as to free dispensaries.

Adivce Given.

For minor medical cases we often write a prescription. In many cases we recommend something that the man can buy at the drug store at a very small cost. This applies to skin rashes of a non-contagious nature, bronchitis, colds, etc.

In the case of bad varicose veins we either recommend that the man have an operation for the same or wear a rubber elastic stocking.

In the heart cases we give these men advice as to what kind of work they can do with safety to their health and also general advice such as to avoid running upstairs and the like.

Our venereal cases are simply directed to go to a good physician and get a permanent cure, or go to a government or city dispensary and get the proper medical treatment there; also to avoid quacks. In no case do we allow them in the food producing departments.

For hernias we advise operations. The young man we especially recommend an immediate operation, while he is young and can easily undergo the operation. In the case of an old man we recommend that he get a truss. In all cases, we require either an operation or the wearing of a truss before they come back to work.

Also, we find a lot of men who have not been vaccinated, especially among the colored. Here we require vaccination either by their own doctors or the examining physician.

In case of failing vision we lay strong emphasis upon their securing of the proper glasses for their eyes. If they haven't the money to purchase the same, we send them to a certain eye dispensary where they only have to pay for the lenses.

The amount of ignorance prevailing among the ordinary workman is appalling as to where he can get free medical attention without cost or expense to himself. In most cases, this free medical attention is far better than he could afford. In the large cities there are hundreds of free dispensaries for every kind of an ailment—dental, eye, operative, skin, lung, medical, etc.

Many workmen have serious defects often unsuspected by themselves. Many come in who have no idea as to the condition of their lungs, others as to their heart, etc. Most workmen do not realize the seriousness of having a hernia. We question them about it and advise the proper treatment, and they will come back invariably with the statement that it has never bothered them. Many would rather quit their job than buy and wear a truss. Many do not suspect at all that they have a hernia, in fact, good-sized hernia, until it is brought to their attention. One case especially, the old colored man, said to the doctor, 'I got a swelling and I'se been putting everything on it, salve and poultices, and it won't go away." What he had was a hernia.

Then there should be physical examinations of the old employees at intervals to reveal if there is an approaching disease. Many a disease, if caught at the beginning, can be forestalled or warded off. The great trouble is that most workmen allow the disease to get a great hold upon them before seeking proper medical service. In fact, statistics show that 650,000 workmen die every year from preventible diseases.

What the Mechanic Said

"You can always rely on Morrow Cap Screws, Set Screws, Engine Studs and Nuts," said a mechanic in a big Engine Building Plant. "Their threads are exact. It's a satisfaction to work with them."

The finding of the unsuspected defects is the greatest good that can be derived from a physical examination department. Only in this way can the man, his company, or the community be able to help him in maintaining his good health. If for no other reason, this aid to the individual employee will justify the existence of physical examinations in every industrial organization. Then the placing of men in jobs according to their strength and energy often saves the loss of life and limb. The saving of one life is worth the necessary expense of a whole department.

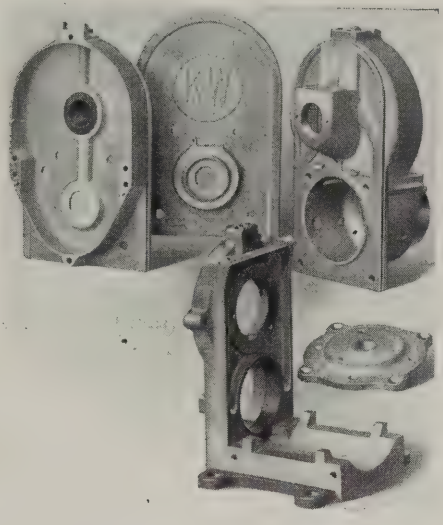
In conclusion, I wish to say that the hiring of men under a physical examination system is the only way of intelligently employing men. When the employer does not know the fitness of his men or the men do not know their own fitness, it is as though the blind hired the blind. Second, that physical examinations are not conducted to bar men from industry, but place them where the safety of their own well-being is not endangered. Third, that by the examination system only can the employer get at his men to carry on any kind of physical reconstruction work among his employees. Fourth, from the viewpoint of efficiency, physical examinations are essential. To industries where they do not place their men according to their physical fitness, weak help is paid for very heavily. Fifth and last, from the viewpoint of safety to the employees, physical examinations are not only absolutely essential, but should be required by the community for its own protection. No industry, because of its lack of oversight over its employees' physical condition, has a right to turn out men upon the community crippled and inefficient to be more or less a public charge.

Physical examinations pay from every point of view, safety, efficiency, humanitarian, and cold cash.

The Shortage of Alcohol

Advisory Council for Scientific and Industrial Research Issues Important Statement

At the last meeting of the Research Council, a summary of the situation with regard to the supply of industrial alcohol was authorized for publication. There is a shortage in Canada of alcohol for power and industrial purposes and this shortage threatens to be world-wide in extent. It has been found to be due to under-production, and in Europe to the scarcity of the raw material from which alcohol is made. In the United States it is already developing as a result of the operation of the Volstead Act, and the production does not now approach the consumption for industrial purposes, the remainder consumed being drawn from the stored supply which will within a year or two be exhausted.



The supply of alcohol in Canada, through the operation of prohibition acts of various Provinces, has in the past three years very considerably decreased. The wholesale price in Canada and the United States is in consequence double what it was in January last, and it is likely to go much higher.

In Great Britain methylated spirits is selling at more than five shillings a gallon, that is more than three times the price in 1914. This will operate seriously against certain industries which require denatured alcohol for manufacturing purposes, and a large number of such industries are in Canada.

The Research Council is of the opinion that the distilleries in Canada can be turned to the production of alcohol in order to meet, as far as possible, the demand at home and abroad. It is considered that plants now idle, if uesd for the purpose will give satisfactory returns for the next ten years at least.

and meet an urgent need in certain industries which otherwise may become acute.

A change in the regulations governing the denaturing of alcohol for industrial purposes has been made with a view to making industrial alcohol available to the arts and industries at a more reasonable price than the present. Circulars are being sent out by the Department of Inland Revenue, authorizing the manufacture and sale, without restrictions, of a new grade to be known as grade 2 benzol. The denaturants used in this are benzol, nitro-benzol, and pine oil. The cost of these denaturants will be very small as compared with the cost of methyl alcohol, which was formerly the only denaturant allowed to be used.

The cost of the denaturant was responsible in a large measure, it is stated, for the high cost of industrial alcohol, and therefore a committee composed of three members from the Department of Inland Revenue, with two from the Research Council, held several meetings to decide on the form of a new and cheaper denaturant to be allowed. This has now been set forth in the circulars which are being issued from the department.

While nine distilleries have been licensed for the manufacture of industrial alcohol, it is stated that only two have yet begun the work, but it is expected that within a short time several distilleries will be manufacturing industrial alcohol, which has been spoken of as the successor of gasoline as a motor fuel.

The operation of the Volstead Act in the United States has also reduced the output there, and it is stated here that United States distilleries are now producting only 66 per cent. of their needs, so that there is little hope for relief by importation, and the supply in Canada will be short until more distilleries are turned in to the new work.

Accepts New Position

John R. Davidson Leaves Hugh C. MacLean Co. to Join Western Retail Lumbermen's Association

John R. Davidson, who for the last few years has been managing editor of the Hugh C. MacLean Co., Ltd., Winnipeg publishers of *The Commercial*, *The Western Lumberman*, *The Western Canada Contractor*, and *The Western Canada Coal Review*, has resigned that position, and will on October 1st become affiliated with the Western Retail Lumbermen's Association, of Winnipeg, where wider scope presents itself for his long editorial experience. Trade journalism will not be entirely lost to Mr. Davidson, for included in his new work will be the management of the Association's new magazine *The Prairie Lumberman*, which is the house organ of the retail lumber dealers in Western Canada, being published monthly. Fred. H. Lamar is secretary of the Western Retail Lumbermen's Association, with offices at 406-9 Scott Block Winnipeg.

According to D. B. Dowling, Dominion geologist, the most extensive explorations for oil ever undertaken in the West save by the Imperial Oil Company, will be conducted next year by the Whitehall Oil Company of England. The company is composed of a group of British capitalists, of whom Lord Cowdray is the chief. A number of experts from the Dominion Geological Survey Branch have been loaned to the company and are making extensive surveys in the foothill area of Alberta and also up in the extreme north. A great deal of machinery and drilling equipment will be introduced next spring.

ROUND STEEL WELDED TANKS

Top End Open

Made any gauge iron from 20 G. to 5-32″ plate, welded throughout, making them like a one-piece tank, therefore cannot leak. Formerly these tanks were riveted and, as they were made of black iron, they could not be soldered and were therefore very liable to leak, in fact the lighter tanks could not be made leak-proof, but the new welding process has changed all this and we can now give you a tank that we can guarantee absolutely. We specialize on heavy tanks for manufacturers, finished round top with heavy angle steel if so desired.

SQUARE WELDED STEEL TANKS

Made any size or shape to suit. Being welded throughout they are just like one piece of tank, and there is no chance of leakage as with the riveted tank. We can supply these up to 10G or 1-8″ plate. We finish them around top with heavy angle steel and the larger ones with extra cross and upright braces. Can supply any necessary Pipe Fittings.

Also Air Pressure and Gasoline Tanks

Deaths Among Prominent Manufacturers

Henry B. Smith

President of the Dominion Sugar Company, Limited, Dies Suddenly at Chatham, Ontario

Henry B. Smith, president of the Dominion Sugar Company, Limited, and for years a leading lumberman, died at Chatham, Ontario, early in the morning of September 25th. Mr. Smith had come to Chatham to attend a directors' meeting, but was atacked by acute indigestion, which proved fatal. He was about seventy-two years of age.

John MacFarlane

Former President of the Canada Paper Company, Limited, Dies at the Age of Seventy-Nine

On Monday, September 27th, the death of John MacFarlane occurred at the residence of his son, D. H. MacFarlane, Westmount, Quebec. The late Mr. MacFarlane was for many years identified with the paper manufacturing industry in Canada, and, at the time of his retirement from active business in 1912, was president of the Canada Paper Company, Limited.

Mr. MacFarlane was born 79 years ago at Fort Erie, Ont. He was educated in Montreal and worked as a clerk in two or three paper firms, finally joining Angus and Logan of which the Canada Paper Company, Limited, is a development. In 1880 he opened a branch of that company in Toronto, where he lived for eighteen months. He became a partner in the firm and eventually president. He was at one time mayor of Westmount, and a school commissioner.

Three sons, Douglas, Arthur, and David H. MacFarlane survive, and two sisters, Mrs. C. G. Godwin, of Ste. Anne de Bellevue, and Mrs. F. B. Francis of New York. Mrs. John MacFarlane died in 1914.

W. T. Whitehead

Connected With Cotton Manufacturing Business for Many Years, Dies at Montreal

By the death of W. T. Whitehead, which occurred recently at his late home in Montreal, the cotton manufacturing business loses one of its leading members. Mr. Whitehead had been associated with textile factories throughout his business career. In 1899 he promoted the Colonial Dyeing and Bleaching plant and the Mount Royal Spinning Company, both of which are now owned and controlled by the Dominion Textile Company. He was also interested in the organization of the Wabasso Cotton Company at Three Rivers.

Mr. Whitehead was a member of several clubs, including the Mount Royal, St. James, Forest and Stream, Hunt Club and Montreal Jockey Club. In addition to his widow, he is survived by his son, T. Ross Whitehead, vice-president of Whitehead, Winans, Limited, of which firm he was president; by two younger sons, W. T. Whitehead, junior, and Robert Labatt Whitehead, and by a daughter, Mrs. Geo. Drysdale Drummond, of Montreal. Mr. Whitehead's eldest son, Capt. Ward Whitehead, was killed in April, 1915, while serving with the 13th Battalion in the second battle of Ypres. Mr. T. Ross Whitehead also saw active service with the Royal Flying Corps in France and Italy.

H. W. Welsh, former manager in Sherbrooke, Que., for the E. & T. Fairbanks Company, Limited, and latterly manager of the scale department of the Canadian Fairbanks-Morse Company, Limited, at Montreal, has been appointed manager of the MacKinnon Steel Company, Limited, at Sherbrooke

Some Points About Trade With the Orient

British Columbia Business Men, Recently in China, Discuss That Market From the Standpoint of Canadian Exporters, and Give Good Advice

INCREASING interest is being shown in the possibilities of extending Canada's trade with the Orient, a subject of particular moment to members of the C.M.A. resident in British Columbia. From time to time business men from the coast province venture across the Pacific and make a personal study of conditions in the Oriental market, giving on their return impressions of their trips. Recently two Vancouver men made the journey and gave out very interesting interviews to the press when they got back home. One of these was Robert Kelly, managing-director of Kelly Douglas & Co., Limited, and the other J. Fred Sanders.

Interviewed by the *Vancouver World*, Mr. Kelly had the following comments to make regarding the trade outlook with China:—

"Canada has as good an opportunity in the Orient as any country, and a far better reception is liable to be awarded the Canadian commercial man over there, than those of other nations, because Canada is essentially British and therefore enjoys in advance, so to speak, the confidence given by foreign nations and races to the British.

"I went over to the Orient with a view to making a preliminary survey of the situation, and with the idea of going after some of the trade that the Americans are getting away from us. It was certainly disappointing to see how comparatively little attention was being given to Oriental trade by Canadian exporters. Compared to the efforts which others are putting forth, notably the Americans, and even the Belgians and Italians, Canada's efforts in this direction are very small.

Huge Waiting Market

"But Canada has no greater opportunity in the field of foreign trade, than in China. There is a huge waiting market for certain lines of Canadian produce. When one considers that in China there are 500,000,000 consumers, or possible consumers of a tremendous amount of merchandise which we can supply, it is most amazing that no concerted effort has been made by Canadian business men to get a share of this trade."

Mr. Kelly found the Chinaman to be a shrewd trader, but a man of principle, and one whose word is as good as his bond. He found them largely interested in the possibilities of trade relation with Canada, but somewhat discouraged because in some instances their courteous inquiries mailed to Canadian houses had been treated with indifference, or ignored entirely.

In discussing what Canada should do to win her fair share of this trade, Mr. Kelly pointed out that, in China, business is done on a different system to that in general practice in Canada.

Should Visit China

"The first step which the Canadian exporter should take is to visit the country. He should familiarize himself with conditions over there, and adapt himself to those conditions. The Chinese like to do business in their own way, the way their fathers and forefathers for generations back have done business. For instance, there is no use in quoting prices on goods f.o.b. Montreal or Winnipeg. The Chinese want c. i. f. quotations on goods at Shanghai, or Hongkong, Canton

Pekin, or at some of their other great cities and ports. They feel that we can better quote that way, than they can order our way, buying at Montreal, Winnipeg or Vancouver, and leaving to the Chinese the business of figuring out shipping, customs, etc.

"Another important point to recognize is the fact that confidence is largely the basis of trade with the Chinese. If they know you, have done business with you in the past, have received courteous treatment and full value for their money, they will do business with you again, and so long as you treat them fairly, it will be very hard to win your trade away from them.

"Many exporters have learned this lesson all too late. The Chinese merchant cannot be treated with indifference, but must be considered carefully, and his trade built up by good, careful business administration.

Joint Trade Exhibits

"Another thing to consider is the advisability of a joint trade exhibit in some of the leading seaports and cities over there. If our Government would become energetic in looking after Canadian business in China, and if our manufacturers would better support the Government representative over there, and build up a reputation in China for high business probity and integrity, I see every reason to think that in China Canada would quickly build up a tremendous trade. But if we make no effort to win a share of this trade, we will not get it. Nothing doing, you know, is the result of doing nothing."

From Another Viewpoint

Mr. Sanders' comments were given in the course of an interview with John P. McConnell, appearing in the *Vancouver Sun*. Mr. Sanders had the advantage of a six months' stay in Shanghai.

The Chinese market, he declares, like all things Oriental must be understood. The methods, the merchants, their practices and their prejudices must be known to the trader who would win their confidence and a share of their trade. Confidence is, first and foremost, the preliminary requisite to trade with a Chinese merchant. But once that confidence is established the Chinese become steady and loyal customers. very difficult for a competitor to win away.

Their standard of commercial honor is universally high. A Chinese merchant's promise is as good as his written bond in most cases. His "can do" settles the matter. When he says "can do." it means he will do and further elucidation is unnecessary.

On the other hand he expects the same standard of business probity from those with whom he deals. Once he is deceived it is rare that his confidence can be regained.

A Shrewd Trader

Mr. Sanders says there is no shrewder trader in the world than the Chinese merchant. He is extremely conservative and shy of making new connections. That is one of the reasons why entry into the Chinese market is a delicate operation requiring tact, skill, and above all, an intimate knowledge of the Chinese point of view and the conditions under which he will trade.

Mr. Sanders went to Shanghai in the interests of the B.C. & Overseas Trading Company, Ltd., which he organized here for the purpose of developing trade in products of both countries.

In Shanghai he found that the Canadian manufacturers were giving very little support to the efforts of Dr. J. W. Ross, the Canadian trade commissioner, of whom Mr. Sanders speaks in very high terms; Dr. Ross has done a great deal

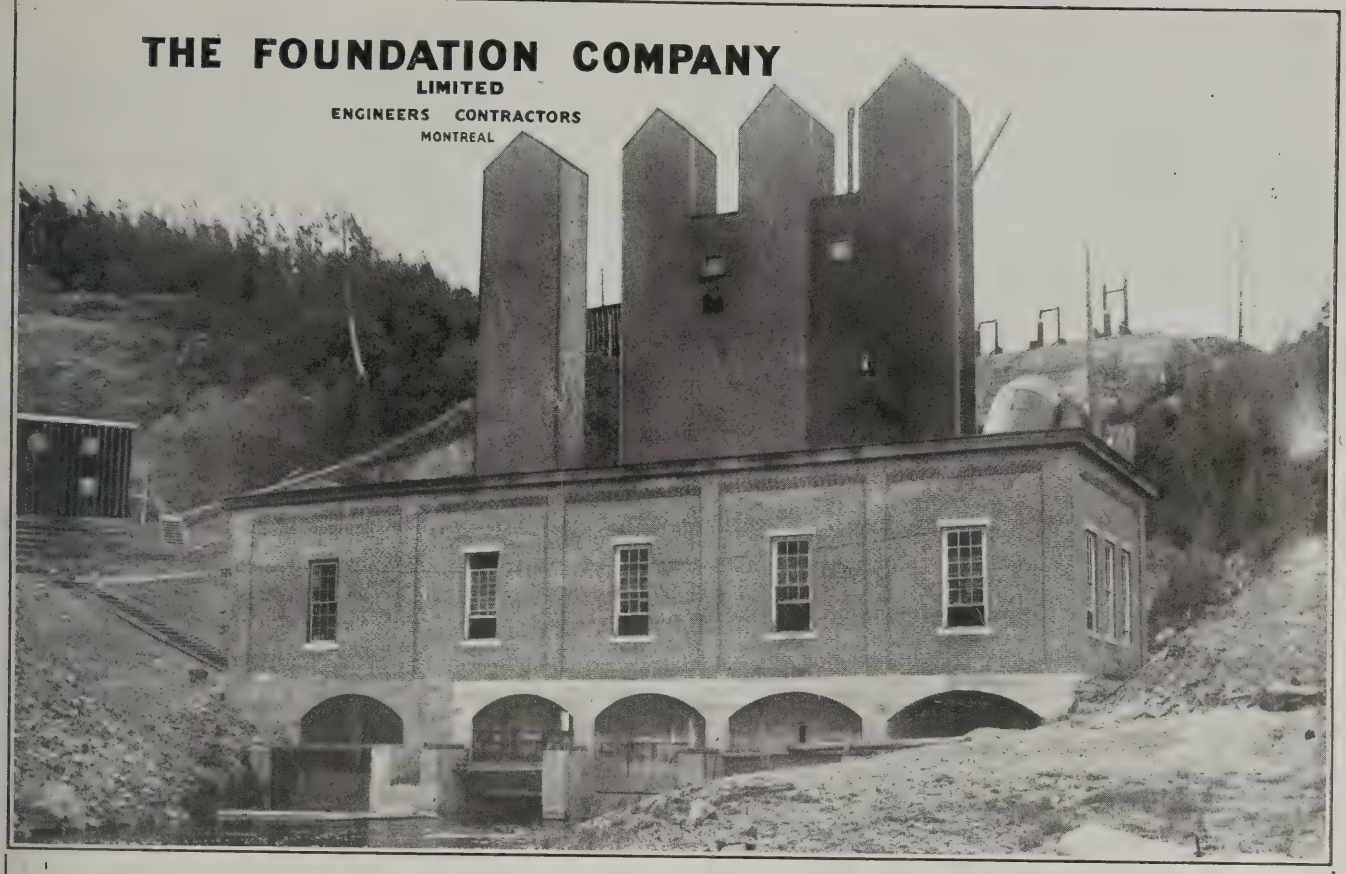
Sparling Service Experience
Counts in Building Construction

A NEW industrial building needs careful and deep consideration. There is much at stake. If you employ experts of mature experience, you avoid loss on your investment.

The possibility of mediocre, impractical plans or of faulty construction, can be eliminated by putting your contract in the hands of SPARLING SERVICE.

From conception to completion; one organization will be responsible throughout—thereby effecting economy, speedy erection and efficient construction.

The Sparling Staff consists of highly-trained and experienced architects and constructional engineers. A specialist is in charge of each department.



Place the proper solution of your building problem beyond doubt by consulting "Canada's Master Builders." Our advice places you under no obligation.

145 Spadina Avenue

towards furthering interest in Canadian goods but has had little or no co-operation from the manufacturers.

At present the trade is divided among the British, American, Belgian, French and Japanese. Italy is also well entrenched. But Canada is a cypher. The existence of Canada is unknown to many.

Many Inquiries

Yet in the short time he was there Mr. Sanders received inquiries for many lines of goods made in Canada, among them the following: Canned fruit, canned milk, canned vegetables, soap, baking powder, glass, boxes, paper, several lines of machinery, rubber hose, boots and shoes, leather, aspirin, flour, hardware, furniture fittings, asbestos, lumber products, galvanized iron, biscuits, chocolates, sugar, candy, stoves, hams, bacon, caustic soda, cheese, butter, brass beds, steel bars, pipes, sheet lead, sheet iron and ready-made houses.

Orders for all these lines are available whenever samples and prices are submitted and Mr. Sanders estimates that not less than $4,000,000 worth of business is in sight at this moment.

Permanent Exhibit

Several handicaps to the development of Canadian trade are mentioned by Mr. Sanders, besides lack of knowledge and the absence of sample exhibits. Too much carelessness has been shown in the past on filling orders. It is absolutely essential that shipments be fully up to sample. Nothing will more quickly undermine the confidence of a Chinese merchant than to find the goods shipped to him have fallen short of the samples from which he bought.

Another point is that quotations should be c.i.f. Shanghai, not f.o.b. at the Canadian factory. If the Canadian manufacturer will reflect that his facilities for figuring transportation costs, insurance, etc., to China are much better, as a rule, than those of a Chinese merchant to figure charges f.o.b. say Woodstock, Ont., the reasonableness of that condition will be manifest. Furthermore, it must be remembered that British and American manufacturers quote on that basis.

And again, Canadian manufacturers have made a bad impression in some quarters by failing to answer correspondence. The Chinese merchant is sensitive to slights of this sort, and even if the Canadian manufacturer is not interested in the market the courtesy of a reply to an enquiry is at least due to the writer of it.

Should Follow up Sales

Another way in which Canadian manufacturers have fallen down is their neglect to follow up initial shipments. There is considerable business to be had from merchants who have had shipments but have not been asked to repeat their orders. The Chinese merchant, like any other, must be drummed for trade until ordering becomes a habit.

Mr. Sanders points out that a permanent exhibit of goods is too expensive an undertaking for any one firm, and for that reason the Dominion manufacturers should follow the example of the British, who grouped a fund for the purpose. The results, however, were so good that after the exhibit was established it was immediately self-supporting.

Huge Market Awaiting

Speaking of the volume of the market available, Mr. Sanders points out that China's population is 500,000,000, and while there is some poverty, thrift and industry are the rule. The classes among whom Canadian goods could be sold would doubtless several times exceed in number those of Great

"Spend your dollar in Canada—and see it again"

When writing advertisers, please mention INDUSTRIAL CANADA.

Britain and the United States combined. The possibilities of such a market can hardly be estimated.

In China there is a quick response to advertising. Probably in no country in the world can a brand be more quickly popularized by advertising than in China. There are many large daily and weekly newspapers printed in both English and in the vernacular.

A Canadian Post Office

Canadian business in Shanghai, too, is handicapped by the postal facilities. Canada should have her own postoffice in Shanghai which would give her a very big advantage over other countries doing business there, owing to the fact that Canada possesses the fastest steamship lines operating between the Orient and this continent. The situation is this: Mail direct to Canada is 5 cents—to the United States 2 cents, and through the Chinese postoffice 10 cents, per letter. As the C.P.R. liners owing to their greater speed and fewer calls, make the trip in 11 to 12 days shorter time than the Japanese ships carrying the American mail, Mr. Sanders says Canada could practically monopolize the mail to Canada even at 3 cents, if a Canadian postoffice were established in Shanghai. As every American mail carries 900 to 1,000 sacks of mail, the Canadian postoffice could derive a handsome revenue besides demonstrating a big superiority over her competitors in Shanghai. The moral effect would doubtless reflect very advantageously upon her trade in that port.

In conclusion Mr. Sanders says that if Canada wants to trade in China her manufacturers must get busy and go after it. It's there to be had but it is not going to come and sit on the lap of people who wait for it to come to them. The European countries, the United States, and Japan have strong representation in the country now.

Advantage of Being British

Canada being British has an advantage over most other countries, for Great Britain has for long years been trading in China and the British have won the confidence of the Chinese as they do everywhere in foreign trade. The Chinese have confidence in British methods, British goods and British people. Canadian manufacturers have therefore a ready-made sentiment in their favor and all they have to do is to live up to the business standards established by the British in order to share in the trade.

No one can deny the importance of a foreign trade to this country. It is not only a patriotic duty which Canadian manufacturers owe their country, but it is a great economic necessity for the prosperity of the people of the country to develop a foreign trade. A finer opportunity for the development of a big foreign market cannot be found than that now offered in China.

The Thurston and Flavelle Company, who operate large saw mills at Port Moody, B.C., have recently taken over the management of the Brunette Saw Mills and will continue to operate them as heretofore, principally for supplying the Canadian market with fir, hemlock and spruce lumber, and box shooks. A certain quantity of lumber and box shooks will also be manufactured for export.

The lumber mill of the Continental Lumber Company, Limited, at River Charlo, New Brunswick, was destroyed by fire in the afternoon of Friday, September 24. Outbuildings of the mill and some large lumber piles in the yard were also burned.

Fred M. Beatty	Midland Woodworkers, Ltd.	Midland, Ont.
R. Scarfe	Scarfe & Co., Ltd.	Brantford, Ont.
W. I. Thomas	Royal Broom Co.	Ingersoll, Ont.

You Can Tell a File by its Teeth

Are they properly shaped? Are they absolutely uniform and evenly set? Are they of steel sufficiently hardened for the strenuous work they must do?

File efficiency depends largely on these points.

In Famous Five Files, you will find teeth that meet all these requirements.

They do a clean job, and they give long service before wear is apparent. They have been the standard for over fifty years.

Specify them when ordering.

The Famous Five are:

Kearney & Foot, Great Western American, Arcade, Globe

Book Reviews

Two Books of Reference

The Annual Financial Review, Canadian, 1920. Compiled by W. R. Houston, Toronto: Houston's Standard Publications. $8.00.

This comprehensive volume keeps pace with the steady growth of Canada's financial and industrial undertakings. There are published in the 1920 volume no fewer than 202 statements of industrial corporations, a striking increase over 1919 and previous years. To anyone who wishes to have complete information at hand regarding the organization, capitalization, financial position and stock market record of the principal Canadian manufacturing companies, this book of 840 pages is invaluable. In addition to industrials, the review deals with assurance companies, banks, loan and mortgage companies, light and power companies, mining, navigation, railway and telegraph companies and trust companies.

The style followed throughout is probably the best that could be adopted for a work of this kind and it would be difficult to find omissions of any importance. Very complete information is given as to capitalization in each case. Directors and officers are enumerated; transfer officers and auditors are named and the dividend record recorded. The balance sheet of the previous year is printed complete, together with the directors' report. Finally tables are appended giving the stock market record of the securities of the company. There is, of course, no comparison of statements covering a period of years, but all such information is available in the earlier volumes of the series.

Canadian manufacturers, who wish to keep posted on the financial position of the Dominion's industries or to have information at hand on this subject, will find the *Annual Financial Review* most serviceable.

The Canada Year Book, 1919. Published by authority of the Right Honorable Sir George E. Foster, G.C.M.G., M.P., Minister of Trade and Commerce, Ottawa. Dominion Bureau of Statistics.

The latest edition of the *Canada Year Book* continues to sustain its reputation for being a handy work of reference. Moreover, unlike many books of reference, it has much material that is interesting reading. The first seventy-three pages are devoted to a history of the war by Brigadier-General E. A. Cruickshank, who is director of the Militia Department's historical section. It is remarkable how much history has been condensed into that limited space.

The usual statistics are given, information on production, trade and commerce, transportation and finance occupying the greater part of the book. Of particular importance to manufacturers are those tables dealing with trade and commerce. Here the exports and imports of Canada are arranged in different categories and for different periods, so that almost any desired piece of information may be easily found.

Other sections are a chronological history of Canada from 1497 to 1919, a description of the country's geographical features, educational statistics and an account of Dominion legislation for the preceding year. The value of the book for purposes of reference is increased by a complete and accurate index.

To Attract New Industries

Canada's Possibilities; prepared by the Foreign Trade Department of The Royal Bank of Canada; Montreal, 1920.

In some sixty odd pages the Royal Bank of Canada presents a statement of this country's actual and potential attraction for manufacturers and business men of the United States. The booklet gives in clear and concise form the essential facts about our great resources in agricultural and forest products, minerals and water-power.

The preferential trade agreements which make Canada an advantageous place to locate an export branch of a factory are clearly stated. The financial position of the country is summarized. Information is given on the income, business profits, excise and luxury taxes. The form of government, banking facilities, labor, railroads and ports are all described. With the statistics which form the appendix the publication is an excellent advertisement for this country and should be useful in attracting United States branch factories to Canada. Another edition containing much the same material will be issued for circulation in the United Kingdom.

Buffalo Standard Heaters

Another Catalogue of Equipment Made by Canadian Blower & Forge Company, Limited

Catalogue number 460 of the Canadian Blower & Forge Company, Limited, of Kitchener, and the Buffalo Forge Company, deals with the types of Buffalo Standard Heaters. Like many publications of this company, it has been prepared for the use of architects and engineers. The information contained has been arranged in tables and graphs so that the solution of various heater problems is readily accessible. Tables for Vento cast-iron low-pressure heaters have also been added through the courtesy of the American Radiator Company.

Talks on Safety

R. B. Morley, General Manager of Ontario Safety League Speaks in Ottawa.

Before the Kiwanis Club of Ottawa on October 1st, R. B. Morley, general manager of the Ontario Safety League, delivered an address on "Accident Prevention." Mr. Morley stated that more than 1,300 violent deaths had occurred in Ontario during the past year, or an average of about 25 per week. He expressed the opinion that every accident was preventable and dwelt at length on the fact that loss of life or limbs was a serious blow to the community through the wiping out of assets or earning power on the part of the victim. Ottawa is to hold a safety week from October 10-16, with a Fire Prevention Day on October 9.

The Imperial Oil Company at Ioco, B.C., is making good progress with its townsite scheme for employees. Contracts have already been awarded for the construction of the first 90 homes, and work will commence on these at once. It is the intention of the company to erect at least 500 houses in the new town, each with ample garden allowance, and the employees will have the opportunity to become sole owners of the properties on long date terms of easy payments.

The Call of The Open

WHEN the days begin to have that unmistakable fall "tang"—when you shiver more than a trifle if you leave your coat home nights—when the leaves are turning brown quicker than you can watch them—right then you feel that impulse to climb into that old khaki suit, to pull on those old knee boots, and to fondle that fine little old rifle—

AND to get up north where the big fellows are—moose, deer, caribou and bear, at your choice according to locality. Why not? The backwoods of Ontario are calling you to a real fall hunte holiday.

AND it's so simple to get there. The Canadian Pacific takes you to all the best hunting country in Ontario. Ask any Canadian Pacific agent, or

Barrett Specification 20-Year Bonded Roof on Ste. Philomene School, Montreal, P.Q. Arch.: Vautrin & Bernier, Montreal. Gen'l Cont.: Ulric Boileau, Montreal. Roofer: J. E Hardy.

The Modern School and its Roof—

STE. PHILOMENE SCHOOL, at Rosemont, Montreal, which is shown in the accompanying illustration, was designed for convenience and safety, and built for economy and permanence.

It is a typical example of the splendid modern school buildings that are found to-day in all the larger Canadian cities. And, like many such buildings, it is covered with a Barrett Specification Roof, laid under the supervision of our inspectors and guaranteed against all repair expense for 20 years by a surety company bond.

This bond may be obtained on any Barrett Specification Roof of 50 squares or larger, in any city of 25,000 or more, and in smaller places where our inspection service is available.

Our only conditions are that the roofing contractor shall be approved by us and that The Barrett Specification, *revised April 15, 1920,* shall be strictly followed.

Important Notice

The Barrett Specification Type "AA" 20-Year Bonded Roof represents the most permanent roof-covering it is possible to construct, and while we bond it for 20 years only, we can name many roofs of this type that have been in service for more than forty years and are still in good condition.

Where the character of the building does not justify a roof of such extreme length of service, we recommend the Barrett Specification Type "A" Roof bonded for 10 years. Both roofs are built of the same high-grade materials, the only difference being in the quantity used.

Full details regarding the Bonded Roofs and copies of The Barrett Specification free on request.

Editorial Comment

A Call to French-Canadians

IT is matter for satisfaction to observe the firm stand that has been taken by the press and people of Quebec on the tariff question. Our French-Canadian fellow-citizens have long been noted for their industrious habits. French-Canadian artisans have played an important part in the development of New England industries, and now that important industries are springing up all through Quebec, they are doing their share to make these a success. In fact, Quebec is making such progress, with its abundant labor resources and its plentiful supply of power, that other parts of the Dominion must look to their laurels.

During the tour of the Tariff Commission through the West, the newspapers of Quebec devoted considerable space to reporting the hearings. In fact, their reports often outdid those of Ontario newspapers in the completeness with which they were prepared. And in their editorial pages, with but few exceptions, strong support was accorded to the protective principle. What, for instance, could be more outspoken than this appeal of *L'Evenement*:—

"Do not let us commit ourselves to an alliance that is opposed to nature, in line with the enemies of that wise policy followed by Sir Wilfrid Laurier himself, who, during the fifteen years that he was in office, persistently maintained a customs tariff greater than that which exists to-day." After pointing out that there are advocates of protection all over Canada, even among the farmers of the West, *L'Evenement* proceeds to say:—"Among the advocates of free trade the egoistical idea of wholly subordinating the welfare of the Dominion to the whims rather than to the well-recognized interests of the wheat growers appears in full force. It is not only free wheat that these speculators demand; they want a radical change in our economic system, imbued with a mercantile Americanism far more than with Canadian patriotism. They are tired of having to reckon with Toronto, Montreal, Quebec, St. John and Halifax, a share of their commercial transactions. The heart of these traffickers does not lie in this country, but in the wheat pit of Chicago. Not being attached to Canada, they have no regard for a policy which has been the cause of the growth of magnificent towns along the length of the great lines of transport across the country. They do not want to wait for the days to come when Winnipeg will be larger than Minneapolis and Montreal a busier city than Chicago."

The Late E. G. Henderson

IN the death of E. G. Henderson, President of the Canadian Salt Co., Limited, the Association loses one of its best-beloved members. Few men taking an active part in the work of the organization won for themselves a higher place in the esteem of their fellows than did he. A gentleman in the truest sense of the term, his presence in any gathering always lent an air of distinction to the company, while his conversation was invariably informed and enlightening. He made and held friends, and very widespread was the regret expressed at his demise.

Mr. Henderson rose to the Presidency of the Association several years ago, and filled the office with ability and devotion. His interest, however, did not die out when his term expired. Though living many miles from headquarters, he continued to be a regular attendant at executive council meetings, and it is perhaps safe to say that no member of council has had a better record, all conditions considered, for attendance than he. He was that unfortunately rare person, a man who could be depended upon.

It is gratifying to INDUSTRIAL CANADA to be able to publish in this issue several tributes to the memory of Mr. Henderson contributed by colleagues on the Executive Council. These all indicate how sincere was the sorrow felt when the news of his death was despatched

from Montreal, and how high a place he held in the estimation of his fellow members. He has left behind him, for the emulation of the membership, a model of what true service to the Association should be.

Our Adverse Trade Balance

THE Dominion of Canada Bureau of Information in New York, which is under the direction of Col. John A. Cooper, makes interesting use of United States trade returns in showing the extent of Canada's trade with the Republic. It may be news to some to know that Canada is now Uncle Sam's second best customer, a position previously held by France. For the eight months ending with August the Dominion bought $100,000,000 more goods from the United States than did France. Great Britain is, of course, the largest purchaser of American goods, but even at that Canada's purchases are equal to fifty per cent. of those of the Old Country, while we buy twice as much as all the countries of South America combined.

Canada continues to be a larger buyer than seller in American markets. In August this country bought goods to the value of $89,244,247, but only sold $59,503,588 worth. For the eight months ending August, United States purchases from Canada were $363,687,617, an increase over 1919 of nearly $70,000,000, but her sales to Canada amounted to $667,588,481, an increase of over $220,000,000. The trade balance is on the wrong side, and that in spite of tariff, adverse exchange and other obstacles. It is clearly a demonstration of what would happen to Canadian industry were the importation of American manufactured products to be facilitated by a reduction in the tariff.

Praise from British Expert

BELITTLERS of Canadian manufactured goods, who can conceive that no good thing can come out of a Canadian factory, will have to pause and take notice when they hear that no less an authority than Professor Alfred Barker, of Leeds University, one of the foremost textile experts in the world, credits Canadian woollen mills with averaging up to the best of the Yorkshire mills. It began to glimmer on the minds of the doubters during the latter years of the war that not only were Canadian textile mills turning out goods more cheaply, but they were actually making better goods than could be imported. More recently witnesses before the Tariff Commission bore testimony along the same lines.

It is encouraging to hear Professor Barker, after a close personal study of the Canadian textile industry, give such unqualified praise to its standing. With regard to woollens, he says:—"Some few Yorkshire mills are better; many very much worse. The machinery employed in Canada is frequently up-to-date. Labor was obviously considerably treated. From four to sixteen automatic looms were being followed by weaver according to the type of work being dealt wit Styles projected in Canada are often quite satisfactor but developed a cloth structure. The color skill whi plays such an important part in the Yorkshire a Scotch woollen trade is not markedly in evidenc This, however, would be one of the easiest difficulti to overcome if Canada seriously sets out to improv ment on the excellent start already made by h pioneer manufacturers."

Professor Barker looks forward to a great develo ment in the hosiery industry, in which Canadian ma ufacturers are pushing ahead with great enterpris As for the cotton industry, he declares that it is a m take to suppose that this industry is restricted Canada by climatic conditions; in fact, he says the is a greater difference between the valleys and hillto in Yorkshire as regards spinning atmosphere th there is between many Yorkshire and Canadian mil

Alberta Manufacturers Protest Legislation

IT was surely reasonable ground for the manufa turers of Alberta to take before the Committee Inquiry appointed to report on the Factories Act the Province when they urged that Alberta should n be called upon to make innovations at the possib expense of local industries. As was pointed out in t brief presented by Mr. C. A. Pratt, Chairman of t Medicine Hat Branch of the C.M.A.: "Fair conditio cannot be different in different Provinces in conne tion with the same industries and the industries in o Province are subject to direct competition by the i dustries in another Province, with the result that a Province that seeks to embody restrictions which a not imposed in competing Provinces, works a gre hardship not only on the manufacturers of the Pr ince, but on the workers as well by driving wo which would otherwise be done in that Province, other Provinces."

The manufacturers of Alberta are facing attem in the way of labor legislation, which they feel a going to be prejudicial to the interests of industry the Province. There is, for example, the effort to est lish minimum wage legislation for adult male worke the unusual provisions of the Factories Act with gard to shifts, and the regulations covering the e ployment of child labor, which are in advance of other Provinces. While not hostile to any propos making towards the betterment of industrial con tions, the Alberta manufacturers feel that it would e not only unfair, but prejudicial to their interests f they were required to take the lead in such matte especially when national labor conferences have l down the principle that progress should be unifo throughout the Dominion.

This point was brought out clearly by Mr. C. Robson, Chairman of the Edmonton Branch of

C.M.A., when he appeared before the Commission. He declared that "The Canadian National Conferences have been unanimous in recommending that all Provinces of Canada should proceed along similar lines and enact uniform legislation. . . . Labor legislation should not as a rule embody special features which have not commended themselves as the best practice to workers' associations and employers' associations as a whole, and particularly in a Province like Alberta, where industry is very gradually coming into its own. Employers should not be subject to restrictions which are not even asked for by organized workers in other provinces and countries."

More Overseas Visitors are Coming

OF recent months there has been quite a noticeable increase in the number of visitors to the Association offices from the overseas dominions and foreign countries. The Commercial Intelligence Department is becoming more widely known as a clearing house of information about Canada and its industries, and business men coming to the Dominion from other countries with the object of forming connections with Canadian manufacturing and commercial establishments are naturally gravitating towards this Department. It is gratifying to know that the work of the Department is proving of value, not only to the men who come from overseas seeking information, but to those Canadian companies with whom they are placed in touch.

The visitors are coming principally from South America and the West Indies, with a small number from Australia and New Zealand. It is significant that the South Americans are beginning to look to Canada as never before for their requirements in the way of machinery, flour, textiles and other manufactured goods. They all report that Canadian goods are wanted, and that a receptive market awaits our products. Let it be hoped that manufacturers will take advantage of the markets opening up for them, and will do nothing, either through neglect, indifference or carelessness, to hinder the growth of South American business.

Housing Conditions in Canada

IT is a disquieting picture that is painted by *Social Welfare*, the official organ of the Social Service Council of Canada, in its special housing edition of October 1. Gathered together in this number are a series of reports prepared by medical health officers and social service workers in the principal cities of the Dominion from Sydney to Vancouver. Their combined testimony goes to show that the housing shortage is reaching almost intolerable proportions, that there is apparently no relief in sight, and that serious results will accrue to the social and physical welfare of the nation if steps are not taken to remedy the unfavorable conditions.

The discouraging feature of the whole situation seems to lie in the futility of the remedies already suggested. We read of the failure of the Housing Commission in Montreal to achieve results, and of the lack of support accorded to the efforts of the Housing Commission in Toronto. Practically all schemes attempted so far to provide housing, other than by ordinary methods, seem to have failed. And the ordinary methods are being neglected because of the high cost of building.

Social Welfare, after painting the picture of slum conditions prevailing in our cities in lurid hues, declares that even revolution in its full physical significance would be justified in the light of such revelations. It appeals for toleration, understanding, sympathy and co-operation. At least one writer urges manufacturers to take a personal interest in the housing of their employees and by the creation of garden cities and the like to do something worth while towards the solution of the problem.

The Supply of Industrial Alcohol

A LETTER has been received from the Canadian Industrial Alcohol Company, Limited, Montreal, directing attention to the editorial appearing in the October number of INDUSTRIAL CANADA, headed, "The Shortage of Industrial Alcohol." The letter expressed surprise that we should have represented that there was a shortage of supply, and made the statement that the Canadian Industrial Alcohol Company had plenty of alcohol to fill requirements and were also in a position to give prospective buyers prompt and efficient service.

They submitted the following as the true situation concerning the supply of industrial alcohol in Canada:

"1. There is no shortage of industrial alcohol in Canada at the present time, and there hasn't been any shortage within the recollection of the management of this Company or its predecessor.

"2. While it was difficult to secure raw material during the war, and on occasions since the termination of the war, nevertheless we have always had sufficient alcohol on hand to take care of our customers' needs.

"3. The capacity of our distillery is approximately 500,000 imperial proof gallons per month, or 6,000,000 gallons per annum. The total consumption of alcohol in Canada for methylating and industrial purposes does not exceed 2,000,000 imperial proof gallons, so that our distillery alone can take care of the entire needs of the country for a year's time by operating to capacity for a period of only four months.

"4. While there has been an ample supply of newly made alcohol for industrial purposes, there has been a shortage of Canadian manufactured two-year-old alcohol for medicinal purposes since the fall of 1919. This shortage was caused by the restricted manufacture of alcohol during the war, when it was found necessary to conserve grain. The shortage still exists and, as a consequence, large quantities of such alcohol has been, and is now being, imported into this country, chiefly from the United States and Cuba. The law requires that alcohol manufactured in Canada for this purpose

must be aged for two years before being sold, but there is no such restriction on alcohol manufactured in any other country, when imported into Canada. As a result of this one-sided law the Canadian manufacturer of alcohol is prevented from selling in this country what any foreign manufacturer is permitted to sell. This strange anomaly was recognized by the Canadian Government during the last session of Parliament by amending the law so that the Governor-in-Council might at any time suspend the operation of this law. Although four months have elapsed since this amendment was passed no relief has so far been given the Canadian manufacturers in this respect by the Government, however, the matter is now under consideration, and it is expected that some action will be taken in the immediate future."

So far as INDUSTRIAL CANADA's editorial references to the supply of alcohol were concerned, it should be explained that they were based entirely on information issued by the Advisory Council for Scientific and Industrial Research, and were not the result of any personal investigation of the subject. We are glad, therefore, to give our readers the information supplied by the Canadian Industrial Alcohol Company, Limited, which throws a much more encouraging light on the situation.

The Power Shortage in Central Ontario

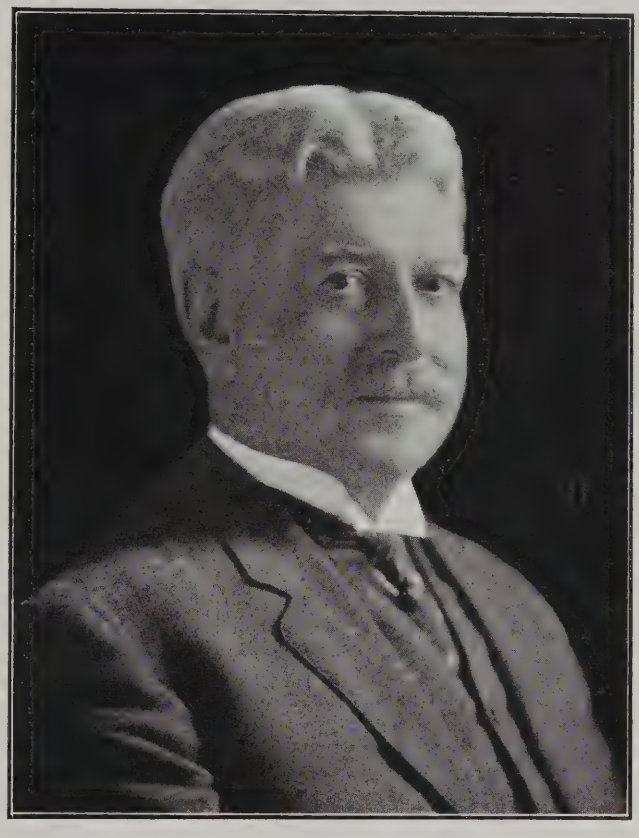
DURING the past month or two manufacturers in the Central Ontario District have been experiencing a serious shortage of power, which has had the effect of interrupting and delaying industrial operations to a most irritating extent. The trouble has extended to all points using power supplied from the Central Ontario or Trent Valley system of the Ontario Hydro-Electric Power Commission, and has been particularly apparent in the larger industrial centres like Peterborough, Belleville and Oshawa.

Correspondents of INDUSTRIAL CANADA in Peterborough and Belleville bear testimony to the seriousness of the situation. Writing from the former point, a prominent manufacturer says:—"Our industries are closed every fourth day, which, as you will appreciate, is a very decided handicap on some of them, particularly the milling companies—the Peterborough Cereal Co. and the Campbell Milling Co. The textile industries have also been hit hard, as well as the metal working shops." A Belleville manufacturer adds:—"Our local industries were entirely cut off from using power for over a week, and have not had their full supply of power for about a month. Companies in this district suffered some loss by reason of goods sold that could not be delivered for lack of power and a falling market, hence cancellations."

The basic cause of the trouble appears to have been the unprecedentedly low water in the Trent River basin. A heated controversy has arisen, however, between the Hydro-Electric Power Commission on the one hand and the officials of the Dominion Government on the other hand, as to the regulation of what water is coming down the river. The Hydro claims that water is being held back unnecessarily by the Government, and that if a normal flow was permitted there would be no power shortage. To this contention the Government officials reply that they are letting down as much as can safely be allowed in order to ensure a sufficient supply during the winter months. An hydraulic engineering specialist sent to report by the Government gives it as his opinion that the water supply has been judiciously handled, and that the storage has already been drawn upon in favor of power up to a point beyond which it was inadvisable to go.

The Peterborough Branch of the C.M.A. held several meetings during the course of the trouble, at which representatives of both the Dominion Government and the Hydro-Electric Power Commission were present. The situation was thoroughly discussed, but neither side seemed willing to agree that the other was right. Engineers of the Hydro Commission put in a plea that the Dominion Government should allow one-tenth of a foot per week drainage in addition to the present flow, which would then enable them to come back to par on power production. The Government, however, took the position that if they did this the lake storage would be lowered to such a point that the winter and spring would hardly be able to bring it back to normal, and there would be a more serious power shortage later on.

At one time the Government offered to let down the one-tenth of a foot per week, provided all the manufacturers and other power users signed a release to the Government for any damages that might ensue. This proposal was not favorably considered, but later on the offer was modified to cover only damages that might be experienced by the power users themselves. This was accepted, and a petition was signed and forwarded. A gradual improvement in the situation, however, has altered the outlook, and it may not be necessary to resort to this method of relieving the shortage.



With the merits or demerits of the respective contentions, it is not our place to deal. We are aware that power users in the affected area are inclined to blame the Hydro-Electric Power Commission for contracting to sell more power than they are able to deliver in times of drought such as have recently been experienced. Be this as it may, it would certainly appear to be the part of wisdom to make every possible allowance for a recurrence of such stringency. A conservative policy in this regard is most desirable in the interests of steady operation of industry.

Power troubles, however, are not confined to the Central Ontario District. They are province-wide and apparently conditions will be worse before the corner is turned. The Power Committee of the Ontario Division is taking action and has already circularized the membership in the province with a view to obtaining all possible data on the situation.

A Devoted Member of the Association who Left his Mark on its Work

AN APPRECIATION

WIDESPREAD regret was felt throughout the membership of the Association when news was flashed from Montreal that Ernest George Henderson, president and general manager of the Canadian Salt Co., Limited, Windsor and an ex-president of the C.M.A., had passed away. His death removes one of the most devoted members of the organization and a citizen of Canada who had few peers. The cause of his demise was pneumonia, following a preliminary operation previously at the Royal Victoria Hospital for the removal of a supposed growth at the base of the brain. The operation was regarded as successful and improvement was marked, but unfortunately pneumonia set in and despite all efforts to save his life, death ensued.

The late Ernest George Henderson

Born Sept. 14, 1858, Died Oct. 13, 1920

From the columns of the *Windsor Sun*, the following account of the late Mr. Henderson's career is extracted. He was born in Holywood, County Down, Ireland, on September 4, 1858, the fourth son of the late Rev. Henry Henderson and Jane Henderson. He was educated in Hillbrook School and College, Belfast. Later he became an articled pupil to the engineer of the Belfast and County Down Ry., continuing this work for four years before his appointment to the position of assistant engineer of the Ulster division of the Great Northern Railway of Ireland. In 1883 Mr. Henderson came to Canada and was engaged on surveys and construction work on the main line of the C. P. R., and on re-measurement of certain sections of that railway north of Lake Superior where disputes had arisen between the C. P. R., and some of the contractors. In 1888 he was appointed assistant engineer of the C. P. R. at Toronto and later resident engineer at London. Under Mr. Henderson's direction the C. P. R. line between Windsor and London was constructed. Mr. Henderson left the employ of the C. P. R. in 1893 to superintend the construction of the plant of the Windsor Salt Works which was organized about that time by Sir William Van Horne and his associates.

Mr. Henderson became, from the outset, general manager of the company and later was elevated to the presidency. Under his personal direction, the Canadian Salt Company, as the firm was called later, has become the greatest industry of its kind in Canada. With the salt plant in Windsor and the large chemical plant in Sandwich for the manufacture of caustic soda and bleaching soda by the electrolytical process (the only plant in Canada which does such work) the Canadian Salt Company has grown steadily—a lasting monument to the energy and ability of its president and general manager.

In spite of his heavy business responsibilities, Mr. Henderson found time to devote a great deal of attention to other interests. For many years he has been active in the affairs of the Canadian Manufacturers Association and served as president of that body in 1916. At the time of his death he was a member of the C. M. A. executive. He was for several years a member of the Windsor Board of Education and served as chairman and was at one time president of the Windsor Board of Trade and later a member of the executive of the Border Chamber of Commerce. As a member of the Essex Health Association, with the late Dr. Smith, former collector of customs, Mr. Henderson shared a large measure of the credit for the construction of the tuberculosis sanitarium at Union-on-the-Lake, destroyed by fire some months ago. Mr. Henderson was an Anglican and for more than twenty-five years sang in the choir of All Saints Church. He was also president of the choir. For the same length of time he was a delegate to the provincial and general synods of the church and a member of the executive committee. He was also a member of the committee named to compile a new hymn book and of the committee appointed for the revision of the prayer book. Only a few days ago Bishop Williams made the declaration that Mr. Henderson was of more value to the Anglican Church than any other man in Canada, bishops and rectors not excepted.

Mr. Henderson was intensely patriotic and devoted to the furtherance of every cause calculated to advance the interests of the British Empire. In the Sportsmen's Patriotic Association and the Soldiers' Aid he gave splendid service. The Children's Aid Society is another organization in which he was deeply interested. He was a delegate of the Chambers of Commerce of the British Empire held in Montreal. He was a member of the Canadian Society of Civil Engineers, the Institute of Civil Engineers of Ireland, the American Society of Mechanical Engineers and of several clubs. In politics he was a prominent Conservative.

Mr. Henderson had two sons, both of whom gave their services to the Empire. Lieut. Maurice Henderson, the younger,

was killed in action in 1916. Captain E. Brian Henderson, of the Royal Air Force, died of influenza in England in November, 1918. Captain Henderson's body was brought to Windsor for burial.

Mr. Henderson made a trip abroad in May of this year and on that occasion visited the grave of Lieut. Maurice Henderson in Belgium. He appeared, on returning, to be in his usual excellent health. About the middle of June, however, he was attacked with severe headaches and periods of dizziness. His condition was not considered serious and he continued at his office for some time. Later his illness became pronounced, ending eventually in his removal to the Montreal hospital.

Tributes from Former Associates:

The universal esteem in which Mr. Henderson was held is attested by the warm expressions of regard that have been received from former associates in the Executive Council of the Association.

President McKinnon

J. S. McKinnon, this year's president, writes: "The industrial life of Canada is poorer on account of the passing away of Mr. E. G. Henderson. He was a man of wise counsel and sound judgment and was a man among men. On different occasions I have seen him interject a word of wisdom and turn the subject of debate into proper channels when otherwise a complicated situation might have arisen. He had friends from the Atlantic to the Pacific who will miss him, and although his death will be greatly lamented, he left his imprint upon his day and generation, and his memory will be held in the highest respect and esteem."

Vice-President Fisher

W. S. Fisher, first vice-president, writes, "It is many years since I first met Mr. Henderson in connection with the work of the Canadian Manufacturers Association, in which he took such a keen interest. I always admired him for his out-spoken frankness as well as his uniform courtesy and kindness of heart and his passing out will be a great loss to our Association. My sincere sympathy goes out to his family circle in the great loss which they have sustained."

Vice-President Shaw

J. R. Shaw, second vice-president, says: "I was unaware of the fact that Mr. Henderson had been seriously ill so that the press announcement of his death in Montreal was a distinct shock to me. How we shall miss him in the Executive of the C. M. A.! His courage, his transparent honesty of purpose, his energy, his vision, his optimism, his ability, his loyalty were an inspiration to all those who came in touch with him.

"The late Mr. Henderson was an Irish gentleman with all that this implies; a captain of industry, a leader of men; a stout and vigorous churchman, and the father of gallant sons who died for their country in the late war. His memory will long be cherished by his friends who were legion, among whom I am glad to say I was numbered."

Ex-President Howard

T. P. Howard, ex-president of the Association, expresses his feelings in the following way: "'He has left his mark.' I know of no more appropriate epitaph to the late E. G. Henderson than this. Past President Henderson was, as every business man in Canada who came in contact with him knew him, the personification of commercial courtesy, courage and comradeship. Of his efforts on behalf of the Association little need be said. There he has doubtless left his mark more strongly imprinted than anywhere else, unless it be upon the hearts of his many friends

"During his regime of office the roots of the Association sank deep and strong into the soul of our commercial life. As a past president, I may say, I felt the strong influence of his work whilst I was in office. The end has come as it must to us all. The roll will be called hereafter and he will be missing, but his spirit in the Association lives on and our supreme tribute in very truth, I think, must be, 'He left his mark; he was a man.'"

Other Prominent Members.

S. R. Parsons, British-America Oil Co., Limited, an ex-president of the Association, sends the following tribute: "In the passing of Mr. Henderson Canada has lost one of her greatest industrial leaders and the Canadian Manufacturers Association a fearless and ardent champion. Well educated, refined, clear-headed, wise in counsel, strong in execution, fair in judgment, broad-minded in his views and relationships, with a high sense of honor and responsibility, he stood out as a prominent figure among the business men of Canada. He left his impress upon his generation and the world was enriched by his contribution towards its development and betterment. His splendid personality leaves a blank that will not soon be filled."

P. W. Ellis, another ex-president of the Association and active for many years in its affairs, writes: "I was greatly shocked to learn of the death of our comrade, Mr. E. G. Henderson, who until so very recently, appeared to us all, strong, healthy and vigorous as always. The death of no member of our organization could be more deeply mourned than that of our dear friend, an earnest worker, fearless debater, most considerate to those who held different views, who made a deep study of all matters of importance coming before our organization, always active, a Canadian through and through. Many of us will remember his splendid address at the annual meeting held in Hamilton, upon our duty to the Empire and the duty of our young people to respond to the call to arms, and to think that address was followed by the loss of his two boys was touching in the extreme.

"We will all carry with us the most pleasant memories of his loyalty to our organization and the spirit of camaraderie that was always present with him. Our hearts go out to his family at this trying moment."

Hon. E. J. Davis, Davis Leather Co., Limited, Newmarket, for many years a member of the Executive Council, writes: "I was shocked a day or two since to notice in the public press the death of E. G. Henderson, Esq., of Windsor, to most of us, I think, quite unexpected. He was still in the prime of life with comparatively a number of years of usefulness before him. He was a personal friend and colleague of mine for many years in connection with the Canadian Manufacturers Association. A man of broad business experience, conscientious and straightforward in all his methods, he inspired the utmost confidence in those with whom he was associated."

J. F. Ellis, ex-treasurer and a veteran member of the Association, says: "I considered Mr. Henderson one of the outstanding ex-presidents of our Association. His keen judgment and thorough appreciation of his position as president was a very valuable asset to the C. M. A. From my many interviews with him and active participation in the work of the Association, I found him an extremely lovable man whose advice and judgment had very great weight in every department of the Association's work. I feel that I have lost a personal friend in the death of Mr. Henderson."

J. H. Sherrard, another past president of the Association, writes: "The death of Mr. Henderson is a very great loss to our Association, and will be keenly felt by every member who has had the good fortune to know him personally. A gentleman of the old school; a man of high honor, splendid courage, excellent judgment and very fine courtesy."

Synopsis of Proceedings before the Tariff Commission in Western Canada

THE OCTOBER HEARINGS

Based on the Official Report

In the October issue the report of the hearings held by the Special Committee of the Dominion Cabinet appointed to hear representations in regard to the Canadian customs tariff was brought down to the end of September. In this issue we complete the report as far as the hearings in Western Canada are concerned. Our report is a condensation of the official stenographic report of the proceedings, and brings out the chief points made by the various witnesses.

LEAVING Nelson, B.C., where the fruit growers and local industries of that portion of British Columbia placed their views before the Commission, the Commissioners proceeded to Trail and there inspected the plant of the Consolidated Mining & Smelting Co., Limited. A session was then held in order to hear representation of officers of the company and members of the local Board of Trade.

TRAIL

October 1.—J. J. Warren, president of the Consolidated Mining & Smelting Co., Limited, appeared on behalf of his own industry. Mr. Warren dealt first with lead. The company's plant, he stated, had a capacity of 100 tons per day of refined pig lead, which is just about the quantity consumed in Canada in normal times. Prior to the war there was a duty of 15 per cent. This was supplemented until 1919 by the 7½ per cent. war tax. The U. S. tariff was 25 per. cent. In 1919, the 15 per cent. duty, plus the war tax, was removed and a specific duty of one cent per pound was imposed. The immediate reason for the change was competition from Mexico, which rendered an ad valorem duty useless. At present the Canadian lead producer was seriously menaced by Spanish, Belgian and German lead brought in from Great Britain.

Canada needed as much protection as the United States where lead plants are larger and costs are lower. The real difficulty was the exchange situation. Unless there was more protection or an embargo, Canadian producers would not be able to compete. A conference was suggested between the company's officials and representatives of the lead metal trades before definite proposals should be submitted.

Consumption of Copper

The normal consumption of copper in Canada in the form of ingots and wire rods was about 18,000 tons per annum. Of this about 6,000 tons are in form of ingots and 12,000 tons wire rods. While war was on, the company was induced by the British Government to install a copper refinery with capacity of twenty tons per day. This was never, and could not be, operated at a profit, because of small capacity. To supply Canadian consumers at a reasonable price it was found necessary to increase capacity to between sixty and seventy tons a day. Contracts were entered into with the Canada Copper Corporation under which railway and power lines were built and smelter enlarged.

Tariff on Copper

Prior to 1919 there was no tariff on refined copper, but the war tax of 7½ per cent. applied. At the 1919 session a duty of 1½ cents a pound was imposed. No duty, however, was collectable on wire rods imported by manufacturers who drew them to wire in their own plants. Unless an adequate duty was imposed, it would not be possible for the company to produce wire rods and supply the Canadian demand because of the limited capacity of the plant as compared with U. S. plants. There were five wire mills in Canada, consuming 12,000 tons of rods. The tariff of 1½ cents per pound should be imposed on both ingot copper and wire rods but, in view of the cancellation of the 7½ per cent. war tax, the duties on fabrication of copper should be revised and it was therefore suggested that a conference should be held.

The normal consumption of zinc was about 10,000 tons per annum. The capacity of the company's zinc plant was in excess of 25,000 tons per annum. The plant was established on the request of the Imperial authorities to provide high grade zinc for munition purposes. At the close of the war, capacity was 15,000 tons but, to get costs down, it was increased to 25,000 tons. The company had therefore to sell in the open markets about 15,000 tons. Its advantage lay in the grade of its product, though this amounted to very little in practice. As a large part of world consumption was in sheet form, the company proposed to put in a zinc rolling mill and asked for adequate protection to be afforded on the production of zinc in this form. In view of all the circumstances, the company felt that a bounty should be voted it in respect of foreign business. Foreign exchange was also a detrimental factor and some further measure of protection should be extended on that account. A limited embargo was also suggested.

Increase in Freights

The recent increase in freight rates operated very disadvantageously against the company. In regard to British and European competition the increase was, to the extent of the increase, a direct contribution from the company to the railways, because no corresponding increase in selling prices could be made. The company was also under a handicap as regards rates from New York and St. Louis. The difference in rates in favor of American shippers was now over ½ cent per pound.

The company, said Mr. Warren, was the only Canadian producer of refined lead, refined zinc and refined copper. It also produced refined gold, and silver, bluestone, fluorspar and both sulphuric and hydro-fluo-silicic acids. It employed directly between 2,000 and 2,500 men and indirectly as many more. It owned several mines and mining claims and a power and light company. The company's ore reserves justified the expenditure of large additional sums of capital, provided the domestic market could be protected on a reasonable basis.

Fluorspar Industry

Mr. Warren concluded with a short memorandum on fluorspar. The company had spent $250,000 in developing a large deposit under the 7½ per cent. war tax. Now there was no protection. At least the same duty as was applicable in the United States should be granted them.

At the conclusion of his address, Mr.

Warren was questioned at some length by Sir Henry Drayton on various phases of the company's business, including the effect of freight rates.

Influence of Smelter

Noble Binns, president of the Trail Board of Trade, asked leave to present a memorandum prepared by the Board. This was read by T. A. Robley, secretary. It showed how serious would be the setback to Southern British Columbia were anything done to injure the business of the Consolidated Company. While only from 2,000 to 2,500 men were employed directly at present, the people dependent upon the successful operation of the company were nearly 20,000. The future development of the mineral resources of British Columbia was largely bound up with the industry.

The memorandum referred to the fact that the company did not earn excessive profits during the war, but that there was an actual impairment of the profit and loss balance. It pointed out that the industry had been somewhat dependent upon Government encouragement; that entirely new processes had been evolved, and that it was highly important that it should be developed and carried out indefinitely.

The memorandum concluded with a brief sketch of the history of the industry. While in the aggregate the plant was not a large one, no less than five separate metals were being produced, and the natural development was to enlarge the production of each until the operations might approximate in size to the highly protected United States plants.

Workmen's Views

Alexander Balfour, a member of the Smelter Co-operative Committee, backed up Mr. Warren's request for protection, claiming that it would not be fair to the men, who had not been paid standard wages during the war, and who had regarded that as their contribution, if any action was taken by the Government that would be detrimental to the industry.

J. A. McKinnon, member of the Trail Board of Trade, spoke as a working man and miner, claiming that the entire country depended on the successful operation of the industry, and the successful operation depended entirely on whatever protection the Government gave. The shutting down of the industry would paralyze the country.

"I am a Canadian, and proud of the fact," said Mr. McKinnon, "and I believe if Canada seizes the opportunity to protect industry, no matter what industry it is, there is no reason to prevent us becoming one of the greatest countries in the world."

Lorne Campbell, representing the Rossland Board of Trade, showed how dependent Rossland, with its gold and copper mines, was on Trail. He also referred to cheap power, which was a great advantage in treating low-grade ore, and explained how important it was from the standpoint of lead production that zinc production should be encouraged. The Slocan mines were all shut down because they had turned zincy. Encourage the zinc industry and the Slocan country would soon come back.

CALGARY

October 4.—The Commission met in the Council Chamber, City Hall, at 10 a.m. George Lane presented a statement on behalf of the Western cattle industry. Its purport was to show, by means of tabulated figures, that the Canadian cattle industry suffered losses amounting to millions of dollars annually through not being able to get into the United States prior to 1913, and that since then, with an open market, Canadian range cattle have repeatedly established new price records in the United States markets. On being questioned, Mr. Lane admitted that he had not been bothering about other export markets, and now the American market was going off.

Price of Cloth

William H. Berkinshaw, director and manager of the W. R. Brock Co., corroborated the evidence presented by Mr. Stone of Vancouver with regard to the prices of Canadian textiles in comparison with imported textiles. He showed that imported woollens from Huddersfield, with about 40 per cent. cotton, cost $4.76 f.o.b. Calgary, while all wool goods from the Paton Mills, Sherbrooke, cost $4.10 f.o.b. Calgary.

William Georgeson, Tuxedo Coffee and Spice Mills, Limited, presented a brief on behalf of the Calgary Branch, C.M.A. It showed that in 1900 the city had 10 manufacturing establishments; in 1915, 69; in 1918, 228, and to-day, approximately 240. In 1905, the investment was $2,000,000; to-day it is over $30,000,000. In 1900 there were 307 factory employees; in 1918, 4,225. In 1900 the output was valued at a little over $500,000; in 1918 it was over $31,000,000. There were in the Calgary district valuable deposits of coal, iron, clays, glass sands, talc, phosphates and other economic minerals. With increased population, the development of these resources would be warranted.

The brief dealt with the free trade argument, showing that, if universal free trade was adopted, manufacturing would be done in the cheapest markets. Tariff for revenue only had been tried in Canada from 1873 to 1879, and had proved to be a failure. Protection had at least given Germany a commanding position in many lines.

Calgary Metal Trades

R. P. Costello, Union Iron & Foundry Co., Limited, presented a statement on behalf of the metal trades, including five companies. These companies have a capitalization of $258,425; they employ 210 persons, and in August had a payroll of $29,845. Eight hundred and forty people are dependent on the industry. The territory served extended west to Golden, B.C.; south to the border; north to Edmonton, and east to Manitoba. The continued existence of the firms was necessary not only for the preservation of the capital invested, but also that the needs of the people might be expeditiously and economically served.

Cost of Tractor Gears

F. L. Irving answered a series of questions by Sir Henry Drayton relative to the cost of master gears for tractors made in Calgary and imported. This went to show that the Calgary manufacturers saved the farmer money on his parts. Mr. Irving further showed how steel shafting and mild steel could be bought cheaper from Redcliff, Alta., than from St. Paul.

In the absence of R. J. Hutchings, Mr. Georgeson presented a brief on behalf of the manufacturers of saddlery, harness and accessories. The remarks referred to the Calgary Saddlery Co. and the Great West Saddlery Co. Employees numbered 195; with dependents, 780 persons were connected with the industry. Thirty years ago 50 per cent. of the saddles and harness used in Western Canada came from the U.S. To-day, over 95 per cent. of these commodities are made in Canada. This was due to the protection given by the tariff. Prices in Alberta were no higher than for competing products from the United States laid down without duty. Should the tariff be removed, they would at once confront the competition of the larger American houses, with whom they could not compete.

Advocated Free Trade

R. J. Deachman, editor of the *Westerner*, appeared as a straight advocate of free trade. Taking the case of the Ford car, Mr. Deachman laid down the proposition that while an industry might be established by virtue of the protective tariff, the cost of establishing that in

lustry might be so great that the country vould be better off without it. The Cana- lian Ford industry, he stated, had made mmense profits. This year it produced 0,000 cars, of which 45,000 were sold in Canada. These cars cost Canadian pur- hasers $7,425,000 more than they would ave paid had there been no duty and hey had bought American cars. Mr. Deachman figured that, in order to pay he excess price, it would take 15,000 eople working all the time, and turning n their money to the Ford Co., in order o pay that excess price.

Attacks Shoe Industry

Mr. Deachman next singled out the oe manufacturing industry, pointing it that for every dollar of capital in- sted in 1900, $1.68 of goods were pro- iced, whereas in 1918 only $1.40 of oods were produced. This he attributed watered stock. He also referred to e fact that the number of employees tween 1900 and 1918 had only increased from 200 to 300 people, which he con- ded was not a very good example of at protection can do in building up industry.

With regard to wages, the witness xt made the proposition that in the oe industry, between 1900 and 1917, e workman was able to buy back out 4 per cent. less of the product he oduced. This he claimed was largely e to the fact that under a protective iff industries were becoming more ly consolidated, and were able to minate labor. He admitted that there e other factors.

n the subject of dumping, Mr. Deach- n thought that the American manu- facturer would not go far in this direc- because it would react on his own rket. His evidence in this connection as questioned by Sir Henry Drayton. Mr Deachman further dealt with some statements in Mr. Findley's brief on the agricultural implement industry, and wet through the manufacturer's state- ment, making out various statements for general comment. Cross-examined by Sir Henry Drayton, he exhibited much ignor- ance as to actual business experience.

Stockman's Views

V F. Stevens spoke for the Stock Brers' Protective Association, which represents the larger operators in the live stock business in Alberta. The membership consists of 210 stockmen, holding an average of 490 head of cattle and 105 head of horses. He presented a resolution passed last July asking for the free movement of cattle and sheep be- tween Canada and the United States.

George H. Ross, lawyer, Calgary, con- tended that Governments in Canada were hurting the country by the imposi- tion of a protective tariff; that protection does not help to develop any of our natural resources; that the tariff is of no benefit to the workingman.

Vindicates Industry

S. Roy Weaver, in charge of the Inves- tigation Department of the Canadian Reconstruction Association, presented a statement in reply to Mr. Deachman's criticism of the boot and shoe industry, claiming that protection had been vital to the industry; that the latter had made substantial progress under a pro- tective tariff, and that the interests of thousands of workers and their depend- ents were closely related to the welfare of the industry.

H. W. Wood, president of the United Farmers of Alberta, next presented a statement. His first proposition was that each industry should be recognized strictly according to its relative import- ance to the whole. His second, that nations must trade. From these he de- duced that when a nation attempted to force development along unnatural lines it was at conflict with nature. Canada, he claimed, was being developed un- naturally, because agriculture was being neglected and industrialism forced. He gave figures to show that manufactured production was increasing more rapidly than agricultural production, and quoted Mr. Findley to show that his company was depending more on foreign than on domestic trade for profits. He con- troverted the statement that the farmers were trying to drive the implement makers out of Canada.

Effect of War

Mr. Wood was interrogated by Sir Henry, and admitted that the production of manufactured goods in 1917 was greatly stimulated because of the war, and was not the result of protection. He further admitted that he had no in- formation about a combination of manufac- turers, but was arguing along general lines.

W. J. Elliot made a statement with re- gard to the live stock industry of the Province. He stated the difficulties that were being encountered through drought, severe winter weather, and low prices. When asked by Sir Henry Drayton for suggestions as to what might be done, he said that perhaps the tariff might have some bearing on the situation, though he admitted that they were not buying anything.

Mrs. Sears of Nanton told of the un- certainties of farming in the Macleod district, and cited the case of a home- steader near Nanton, giving figures about his investment in land, machinery, etc. Another farmer's figures were given, showing a net loss for three years of $14,392. Fully one-third, and perhaps more, of the farmers in the district have had almost nothing in three years.

L. M. Gaetz, Red Deer, gave figures covering farming operations in his dis- trict with a view to showing how unre- munerative farming was.

R. S. Law, Claresholm, referred to the income tax, and said that in 1918 and 1919 the farmers in his district had no returns to make. He thought they should not be required to pay a tax in an abnormally good year without having some chance to recuperate during a bad one.

Lawrence Peterson, Lethbridge, told of the erratic climatic conditions in the Lethbridge district, which he thought an argument in favor of spreading the in- come tax over three years. He argued, with regard to the tariff, that because removing the duty on tractors had stimulated farming operations, the same result might be expected to follow the removal of the duty on other commodi- ties.

Coal Mining Industry

October 5.—W. F. McNeill, Secretary of the Western Canada Coal Operators' Association, on behalf of the coal oper- ators of Alberta, stated that the coal operators opposed, on national grounds, any reduction of tariff on imported coal. At the end of 1919 there were 276 coal mines in operation in Alberta, em- ploying 12,027 persons. They represented an investment of $27,397,275. Colliery workers and their dependents numbered in excess of 50,000. The value of coal produced in 1918 was $20,537,287. The annual food bill of the mine employees and their dependents was in the neigh- borhood of $9,000,000. During the winter months, farmers and homesteaders con- stituted 35 to 50 per cent. of the em- ployees of the domestic or lignite mines. Many men would have to abandon their farms were it not for winter employment in the mines.

Coal Consumption

The annual coal consumption in Western Canada is 9,000,000 tons of all grades. The mines now in operation are capable of producing 12,000,000 tons per year with the present development, equip- ment and plant. Pennsylvania coal to the amount of between 2,400,000 and 2,900,000 tons annually is being imported into Manitoba, representing an annual payment to United States interests of more than $20,000,000. The railways have gradually displaced American coal with Alberta coal on the prairies. Every- thing is being done to increase the mar- ket for Alberta fuel.

The development of Alberta coal de- posits has had far-reaching consequences.

Besides giving employment to the farmers, it has provided them with cheap fuel, and has laid the foundation for industrial development.

Jesse Gouge, Drumheller, a mine operator, took some exception to the memorandum of the Western Canada Coal Operators' Association, claiming that it did not voice the opinion of all the operators. He objected to classing the present tariff on coal as protective, contending it was for revenue only. He further thought that by asking for protection the miners might prejudice their market in the United States.

R. A. Pringle, K.C., on behalf of the textile industry, answered certain propaganda that had been appearing in the Western press.

James Weir, M.L.A., disclaimed the contention that the formers were out-and-out free traders.

EDMONTON.

October 6.—C. G. Robson, Chairman Edmonton Branch, C.M.A., presented a statement. The present industrial development of Alberta amounted to 1,584 establishments, with a capital of $60,000,000, employing 15,000 hands. Reference was made to the Industrial Congresses of 1919 and 1920, showing the interest that was being taken in the development of the province. Figures were supplied as to the coal resources; statistics were given to show the extension of mixed farming. It was contended that a protective tariff was necessary to secure the full development of manufacturing to which the natural opportunities and resources of Alberta will contribute.

The Biscuit Industry.

Harvey Shaw, North-West Biscuit Co., Limited, was in the biscuit business in the United States prior to 1912. He was then convinced it was impossible to get any volume of business in Canada and accordingly established a Canadian plant at Edmonton. He employs 140 people, with agency and selling staffs bringing the total up to 200. Flour is made in their own mill and they use Canadian sugar. Sales in 1919 exceeded $1,000,000 and are increasing. The plant is being extended. No consideration was given to the tariff in fixing prices, and prices were quoted to prove this. The effect of reducing the tariff was explained.

Andrew Rafu, Bon Accord, a director of the United Farmers of Alberta, presented some evidence with regard to the cost of agricultural implements.

W. T. Lucas, Lougheed, contended that farming in Alberta was an unprofitable business. Asked as to how it might be helped, he said he would lower the tariff, but had no evidence to show that prices of implements were higher in Canada than in the United States.

Defended Textile Industry.

C. A. Graham, Great Western Garment Co., Limited, explained why he thought adequate protection desirable. The company started in 1911 with only 11 employees; it has now a staff of 325. Estimated turnover in 1920 was $2,100,000. He defended protection for the Canadian textile industry.

P. Baker, Ponoka, told of the high cost of farming and attributed heavy overhead expenses to the tariff.

Harry Bell, Namao, gave a number of figures covering his farming operations and also his views on the income tax.

Rice Sheppard, secretary-treasurer, United Farmers of Alberta, presented a lengthy brief in which he argued the unfairness of the tariff on farmers with large families. Its unfairness to returned men who had to buy implements at high prices, and the poverty and backwardness of the country as a result of the tariff. The tariff had kept the standard of the workers and farmers down.

Minister of Agriculture.

Hon. Duncan Marshall, Minister of Agriculture for Alberta, spoke as a private farmer and contended that the elements of protection should be gradually eliminated from the tariff. He referred to the great possibilities of agricultural export and believed that production would be stimulated by taking all possible burdens off the back of the farmer. The opportunity to buy in the cheapest market was what was wanted. Protection was no good to the farmer.

SASKATOON.

October 8.—A. I. Turnbull appeared on behalf of the manufacturers of Saskatoon. He regretted the apparent ill-feeling with which manufacturers were regarded. It was, he said, a period of specialization and farmers were no longer independent like their grandfathers. What was required was a better understanding by each group of the problems and difficulties of the other. It was our duty as a nation to extend along all lines. As manufacturers, they approved of what had been done in the way of railroad building, cold storage, experimental farms, etc., for the farming community. Mr. Turnbull then repeated the manufacturers' tariff policy.

In 1905, he said the Province of Saskatchewan had only 55 factories employing five hands or over; in 1918 there were 1,422 establishments. Output increased from $2,500,000 to over $50,000,000. The number of employees increased from 1,576 to 8,188. In Saskatoon in 1905, there were only three establishments; in 1918, 119. The number of employees rose from 36 to 1,230. The value of output increased from $130,800 to $7,620,799. These industries were an important factor in the life of Saskatoon. They required a continuation of protection for their future growth.

Sheaf Loaders and Threshers.

P. S. Houghton, Jackson Machine Limited, explained that his company was making sheaf loaders and threshers. It was organized in 1915 and has an authorized capital of $300,000, of which $100,000 is paid. The greater number of its stockholders are farmers. In 1917 it marketed seven machines; in 1918, 25; in 1919, 67, and this year about 130. It employs about 25 hands the year round. Mr. Houghton thought a non-political permanent tariff commission would be the best way to deal with the tariff question.

C. H. Richardson, manager of the Western Corrugated Culvert Co., Limited, stated that his company had a capital of $100,000 and employed 50 hands. It commenced in 1910 in a very small way and increased from year to year. Protection on culverts was 30 per cent. and on scrapers 27½ per cent. They imported their galvanized sheets, paying a duty of 12½ per cent. Under the present protective tariff, importations from the United States were very heavy, but under free trade the American culvert manufacturers would have no difficulty whatever in cutting seriously into this trade.

J. B. Musselman, central secretary of the Saskatchewan Grain Growers' Association, presented a statement on behalf of the directors. He explained that the Association was the oldest of the western farmers' organizations and for many years it has been in pecuniary measure the mouth-piece of the farmers of the province. Its 40,000 members were all loyal to the best interests of Canada. They believed that the fiscal policy for which they were contending was fairer to all legitimate and reasonably indigenous industries than that in operation.

Farmers Are Loyal.

The most ardent devotee of law and order had nothing to fear from the organized farmers. They were not wreckers. The farmers' leaders were striving to rouse the farmers more fully to their duties as citizens. They felt that the greater the proportion of the

national revenue raised by direct taxation the greater would be the interest of the masses of the people in matters of Government.

Agriculture Chief Industry.

In Saskatchewan grain-raising was and for some considerable time must remain the chief industry. The province would succeed or fail in proportion as wheat-raising was made profitable or otherwise. They were not opposed in its entirety to the principle of national assistance to industries vital to the national well-being, but they held that the indiscriminate application of the principle was unwarranted.

William Hordorn, Dundurn, gave personal experiences as a farmer.

John Kirkpatrick, Nutana, spoke of the increasing difficulty of getting settlers established on the land.

John Evans, Nutana, discussed what he termed the injustice of the tariff.

Murdo Cameron, supported the statement put before the Commission by Mr. Musselman.

Wiljames Thomson made a statement with regard to the cattle industry.

REGINA.

October 11.—Hon. W. F. A. Turgeon, Attorney-General of Saskatchewan, spoke on behalf of the Government and Legislature of the province and claimed that, as a result of investigation and reflection, the present customs tariff had been found to be oppressive to the agricultural communities of the province. He traced the history of tariff resolutions in the Legislature and also dealt with certain findings of the Board of Commerce.

Gordon Love, Dominion Fire Brick & Clay Products, Limited, spoke on behalf of his company, which was organized in 1912 and reorganized in 1916. They employed on an average fifty-five hands. They had made no profits. Under existing conditions there was practically free trade in the fire brick business. He asked for continued adequate protection on face brick and the establishment of a strong protective tariff to guard the fire brick and refractory industry in its infancy.

Want Protection Continued.

Thomas A. Wilson made a statement on behalf of the Western Manufacturing Co. Limited, which commenced business in 1904. Their staff ranged between 60 and 85 men. They manufactured doors, sashes, mouldings, frames, fixtures, show cases, etc. Protection was about 25 per cent. In only three years since 1904 had they paid a dividend. He asked for a continuance of protection.

Hon. George Langley spoke on behalf of the Saskatchewan Co-operative Elevator Co., with 23,000 farmer shareholders. He backed up the platform of the Canadian Council of Agriculture.

Mr. Musselman tendered certain information on the comparative prices of binder twine.

J. A. Mahay, M.P., President Saskatchewan Grain Growers' Association, appeared on behalf of that organization.

From Small Beginning.

W. J. Orchard referred to the origin of the Massey-Harris Co., and said that a man who started in a little blacksmith shop and was able to amass millions, must in some way have had an unfair advantage.

C. J. Watson, manager of the Great West Saddlery Co., presented a statement which contained much excellent information about the agricultural production of the province, and an argument in favor of protection.

William L. Ramsay, Bladworth, a western farmer of sixteen years' standing, said that the views hitherto advanced were those of class leaders. He wanted a national view. Free trade was an ideal policy for an ideal world, but the first to accept such a policy would be the first to fall. Our home market was our best market and the security of Canada's trade lay in protection.

R. M. Johnson, member of the Executive of the Saskatchewan Grain Growers' Association, gave his experiences in farming.

Walter Shaw, President Walter W. Shaw Co., Limited, Moose Jaw, argued in favor of protection.

A. G. Hawkes, one of the first men to start the farmers' organization in Saskatchewan, gave his experiences.

BRANDON.

October 13.—J. L. Brown, President United Farmers' of Manitoba, presented a statement enumerating reasons why there should not only be no increase in the protective tariff, but why, in their judgment, there should be a very material reduction in customs duties. He was followed by Mrs. J. S. Wood, President United Farm Women of Manitoba, who pictured some of the privations endured by farmers, and by Miss Mabel Finch, secretary of the same organization, who spoke along the same lines, claiming that the tariff struck at the root of home life. Miss Finch later admitted that in all her calculations she had simply added the duty to American prices.

Mrs. James Elliott, a director of the United Farm Women of Manitoba, advanced a number of figures in an effort to show how the tariff burdened the people.

C. S. Watkins, a retired farmer, who had been in the country since 1887, thought that the tariff should be substantially lowered. He gave figures showing the result of his farming operations.

C. H. Burnell gave some experiences in which he claimed the tariff affected the farmer seriously.

Roderick McKenzie, vice-president, Canadian Council of Agriculture, spoke on behalf of that body, presenting an argument for reduced customs duties.

John M. Allan, living five miles north of Brandon, gave some figures to show how small were farmers' profits.

W. R. Wood, Secretary United Farmers of Manitoba, read a statement in which he attempted to controvert some of the arguments of the C.M.A.

A. F. Campbell made a statement asking for reduced duties on linoleum.

A. R. McDiarmid, on behalf of McDiarmid & Clark Co., Limited, incorporated in 1912 and manufacturing frames, mouldings and detail millwork, asked for a continuance of protection.

P. M. Ames, Managing-director Manitoba Engines, Limited, also asked for a continuance of the present tariff, as did H. L. Singleton, Brandon Heating & Plumbing, Limited.

WINNIPEG.

October 14.—T. R. Deacon presented a statement on behalf of the Manitoba Bridge & Iron Works, Limited, the Manitoba Rolling Mills Co., Limited, and the Manitoba Steel & Iron Co., Limited, giving detailed information about these companies.

F. A. Gemmel, Selkirk, submitted the experience of the town as an exemplification of the benefit of industrial development. He stated that development along industrial lines operated greatly to the advantage of the country.

Criticized C.M.A.

Norman Lambert, Secretary Canadian Council of Agriculture, dealt with the argument of the C.M.A. and criticized some of its points.

C. Rice-Jones, General Manager United Grain Growers, Limited, appeared on behalf of that organization and explained its operations. He also spoke on behalf of the United Grain Growers Saw Mills, Limited.

Hon. T. C. Norris, Premier of Manitoba, presented a resolution passed by the Legislature of the province at its last session, dealing with the tariff.

(*Concluded on page* 92.)

An Analysis of the Income Tax as a Means of Raising National Revenue

AN EXHAUSTIVE ARGUMENT

In the accompanying brief, which was presented to the Tariff Commission at Winnipeg on October 14th by Mr. E. Parnell, a complete answer is given to the claim of the Council of Agriculture that the Income Tax, if thoroughly and forcefully applied, could be made to yield $200,000,000 at present rates. The experience of such other countries as New Zealand, Australia, Great Britain and the United States is given, and the conclusion is arrived at that Canada's showing, as regards the collection of the Income Tax, is most favorable. It is further borne out that income taxation is largely a tax on the industrial population and that agriculturists escape all but a very small part of the burden. In fact income taxation cannot successfully be applied to rural communities.

OFFICERS and other representatives of the Canadian Council of Agriculture, and its component organizations, have been advocating income taxation as the principal means of providing national revenue to compensate for the loss which the Federal Treasury would incur under the so-called "New National Policy." In the memorandum to the Tariff Committee at Winnipeg, on September 14th, the Council expressed the opinion that:—

"It is not unfair to say that the income tax, if thoroughly and forcefully applied in this country, ought to yield a revenue of at least $200,000,000 per annum at the present time."

In attempting to review that statement in the light of the income tax experience of other countries, and the short experience of Canada itself, we do not wish to be understood as attacking or even criticizing any group or element in the Dominion. We believe that the agriculturists of Canada are no more unwilling to pay their rightful share of taxes than is any other class, or group. We accept, too, without reserve, the assurance that the farmers and their spokesmen are sincere in regarding the income tax as a fair and reasonable means of compensating for the loss of customs revenue, which would result from the tariff changes which they propose. But we believe as well that, before any important alteration be made in our present fiscal system, the requirements of the Treasury ought to be assured. It is right and proper, therefore, that the statement of the responsible heads of the Canadian Council of Agriculture, as to the revenue possibilities of the Federal income tax in Canada, be subjected to the test of practical experience and that the incidence of the revenue system proposed be considered with the utmost care. Canada's present financial situation does not justify experimentation and in the national interest the claims of those who advocate change ought to be analyzed thoroughly to see whether such claims be true and economically sound. To remove any misunderstanding, permit me to point out that the Council of Agriculture has frankly recognized that "the rate of income taxes (i.e. in Canada) compares favorably with that of other countries of a character similar to Canada." This considerably narrows the field of inquiry, inasmuch as the claim is made that, with the present rates of taxation of income efficiently applied, a yield of $200,000,000 annually could be secured immediately.

The Council's estimate of the possible yield of the income tax in Canada appears to be based on war-time collections in New Zealand. The yield of the New Zealand levy is multiplied by the numerical ratio between the populations of Canada and the sister dominion and the amount is set down as a reasonable expectation of what similar taxation ought to produce in Canada.

An Exclusive Levy

Unlike Canada, New Zealand has a single and exclusive levy by the Dominion Government on all incomes derived from sources other than the use or produce of land. There are no provincial levies and local revenues are raised by land taxation, supplemented to a minor extent by fees, licenses, etc. Income is taxed once, and only once, whereas in Canada there are, in addition to the Federal levy, income taxes already imposed by two of the Provincial Governments, and, in a number of cases, heavy income taxes as well by municipal authorities. To take only three instances, residents of Toronto pay an income tax to the municipality and also a tax to the Federal Treasury on the same income. People in British Columbia are assessed on their income by both the Ottawa and the Victoria administrations. Edmonton citizens pay a tax on their income to the Dominion, another tax on the same income to the municipality, and the Provincial Government is reported to be about to bring down an income tax law, so that their earnings may be levied upon three times each year by three several governments. All the provinces of the Dominion collect corporation taxes of varying severity. Moreover, the municipal business tax, in operation in Toronto, and somewhat similar taxes elsewhere, under different names, on business interests are nothing more or less than taxes on income. Direct income taxation in New Zealand is the exclusive prerogative of the Dominion Parliament. In Canada, every income is liable to assessment by the Dominion Government, by the Provincial administration, and by the municipal authorities. The Canadian Council of Agriculture is on sound ground in urging that there should be the least possible over-lapping in taxation and that as equitable a division as possible ought to be made in the field of taxation between the Dominion, the provinces, and the municipalities. But we must face conditions as we find them, and the fact is that the provinces jealously regard any resort to direct taxation by the Federal Government as an encroachment upon the rightful and traditional taxation sphere of the provinces. This attitude was plainly indicated in a speech by Sir Lomer Gouin, then Premier of the Province of Quebec, in Quebec City, on January 21, 1920. He said:—

"I would not like to go too far back, but I think that on this question of taxation, one who is in public life should never forget the spirit which actuated the Fathers of our Constitution when, in 1867, they went into that pact which gave us the Canadian Confederation. It was thought at that time that indirect taxation should be left to the Federal Government and direct taxation given to the Provincial Governments.

"It is not that I have the intention of quarreling with the Federal authorities because, having to face grave needs as they had, they have been forced to impose temporary direct taxation, but I think that for those who like their province and love their country, now that we are coming back to normal conditions, the principles which we find at the basis of the British North American Act

should be respected if we want to keep our Confederation on a solid and growing one."

But aside from the fact of over-lapping of taxation in this country, whereas there is no such duplication of levies in New Zealand, the New Zealand Act is unlike the Canadian legislation, inasmuch as the New Zealand income tax is practically the only levy on income from sources other than land. In Canada, there are several such Federal taxes which ought to be combined before attempting to compare the taxation burden assessed against incomes in Canada with that in other countries. In addition to the income tax proper, there is the Business Profits War Tax. Business income, if assessable for the higher levy of the Business Profits War Tax, pays under that heading, and the collections reported on account of income tax represent principally payments on personal incomes. Then there are in Canada, special Federal taxes on banks, insurance companies, and trust and loan companies. These levies in effect are only special divisions of the Canadian Federal taxation of income. Direct income taxation by the Dominion Government in the fiscal year 1919-1920, was as follows:—

Income Tax (largely on personal income)	$20,264,242
Business Profits War Tax	44,145,184
Taxes on banks, insurance companies and trust and loan companies	2,083,170
Total	$66,492,596

Propriety of This Grouping

The propriety of so grouping the collections under the Income War Tax Act, 1917, and amendments; the Business Profits War Tax Act, 1916, and the Special War Revenue Act, 1915, in order to arrive at the amount of Federal Taxation of incomes in Canada, cannot be challenged. Section 3 (*a*) of the Business Profits War Tax Act, 1916, provides for deduction of the amount of tax payable under Part One of the Special War Revenue Act, 1915, and Section 4, Subsection (5) of the Income War Tax Act, 1917, provided for deductions of amounts payable under the Special War Revenue Act, 1915, and the Business Profits War Tax Act, 1916.

For 1918-1919, the first year in which income tax was collected by the Federal Government in Canada, Dominion taxation of income was as follows:

Income tax (principally on personal incomes)	$9,349,720
Business Profits War Tax	32,970,062
Tax on banks	1,099,764
Tax on trust and loan companies	323,340
Tax on insurance companies	546,114
Total	$43,289,000

For 1920-1921, official estimates, as shown in the last budget speech of the Minister of Finance, are approximately as follows:

Income tax	$35,000,000
Business Profits War Tax	40,000,000
Taxes on banks, trust and loan companies, and insurance companies	2,100,000
Total	$77,100,000

New Zealand Taxation

Income tax collections in New Zealand for the fiscal year 1919-1920 amounted to £6,369,765 ($30,999,523 at parity of $4.86⅔ to the pound sterling). New Zealand's population is about one-seventh that of Canada, and it has been suggested that this country ought, under efficient administration of the income tax, to collect a revenue proportionately larger. It has already been explained that the New Zealand tax is an exclusive levy on income, whereas, in Canada, Federal taxation of income must be limited by consideration of the taxes imposed by the provincial and municipal governments. Nor is this the only difference. New Zealand is a comparatively centralized community, long established, prosperous, and with relatively much more accumulated wealth than is found in Canada. Moreover, taxation in New Zealand is not limited as is the case in Canada by proximity to a great wealthy country of the same language and customs, and continually offering opportunities and rewards for immigration. Not only is the United States a competitor with this country for Canadian human resources, but the Republic, to a very large extent, now controls the capital so urgently needed for the development of the Dominion. The chairman of the Tariff Committee, as Minister of Finance, recognized in his last budget speech the limitation upon Canadian taxation which is imposed by our relationship to the United States, but he ventured a small increase in the Canadian income tax rates over those in force south of the international boundary. He said: "That our measure of taxation must, in view of our geographical situation, have regard to United States legislation, is a principle that has found general acceptance. I do not desire to question it. But revenue is urgently required and a difference of 5 per cent. in those individual and corporation taxes will not deter immigration and the investment of outside capital so essential to our national development and growth."

Gradual Improvements

The New Zealand income tax has been in force continuously since 1892, and in a comparatively small, settled country of less than 104,000 square miles, with a population of about 12.5 to the square mile, as compared with only 2.36 in Canada, twenty-seven years' operation has enabled such improvement of administrative machinery as to increase collections and follow up attempted evasion. For many years, the New Zealand tax did not yield a large revenue. Ten years after the Act was first operative the collections under the Income Tax were less than $1,000,000, and in 1901-02, customs and excise duties were still responsible for 73.6 per cent. of the taxation revenue of that Dominion. In Canada, on the other hand, the Federal income tax is an entirely new levy, operated only under war conditions, encroaching on a revenue source already tapped by provincial and municipal governments, and operated under the peculiar difficulties of enforcement which obtain in Canada by reason of geographical and other conditions. It ought also to be kept in mind that the high yield of the New Zealand income tax was accounted for in very large measure by a special war tax superimposed upon the normal rates. Imports into New Zealand were greatly curtailed by war conditions, involving a reduction in customs revenue at a time when the financial needs of the country were largely increased. The income tax, long established, and with administrative machinery already at hand, together with the land tax, offered the most readily available means of augmenting the revenue of the State. But a continuance of the war-time rates indefinitely under peace conditions has not been seriously proposed. One of the most forceful of all the arguments which have been advanced in justification of the income tax is that it provides a ready means of securing a large increase in State revenues in time of emergency. It is the most elastic revenue element. But high rates which may be desirable under emergency conditions may be entirely too burdensome as a normal peace levy. The United States, for example, with large wealth, accumulated before 1914 and between 1914 and the time that country entered the war, was able by means of direct income taxation to levy a large emergency revenue. But the Excess Profits Tax Act (the levy on the income of corporations) has been admitted by Treasury officials and other experts to be unsuited to peace conditions and already the rates have been substantially reduced from the war-time maximum.

There is another side to the comparison between taxation systems of New Zealand and Canada which is of interest. When in 1891 New Zealand abandoned the Property Assessment Act, under which a general property tax has been levied, and substituted therefor the Land and Income Assessment Act, it

was frankly recognized that an income tax was almost impossible of effective, equitable application to rural communities. The same lesson had been learned years before by some of the Commonwealths in Switzerland, and Prof. Seligman, in his "Essays on Taxation," states that the New Zealand Government followed the example of the Swiss cantons and instituted a land tax to supplement the levy on income. The land tax, in New Zealand, is a capital tax, assessed on the gross saleable value of the land, less the value of all improvements made upon it. This valuation, both for purposes of Federal and local taxation, is made by the Federal Government. An owner is allowed an exemption of £500 on land, the nominal value of which does not exceed £1,500, but the exemption diminishes on holdings of greater value, and when the value is above £6,000 no exemption is allowed. With a super-tax, the present rate ranges from 6¼ to 23 mills on the dollar of assessed capital value. It must be remembered that this tax is in addition to the local rates of land taxation. For the year ended March 31, 1920, the land tax yielded £1,557,903, or $7,581,795 at par of exchange. Those who claim that the Dominion Government should be collecting $200,000,000 annually by income taxation have failed to point out that, under the New Zealand system on which they base their argument, this country would collect an annual land tax of more than $53,000,000 and that, as in New Zealand, the larger part of this levy would have to be borne by the agriculturists. Moreover, in New Zealand, the income from mortgages on land is now assessed under the Income Tax Act, and, of course, the tendency is that this burden, too, will be shifted in large measure to the farmers.

Australia

Australia, also is sometimes cited as an example for Canada in income tax administration. Indeed, the comparison with Australia is fairer than with New Zealand, inasmuch as the Australian States, like several of the Canadian Provinces, collect income taxes as well as the Federal Government. The latest issue of the Official Year Book of the Commonwealth of Australia, gives financial statistics only to the end of the fiscal year 1917-1918. In that year, the combined income tax and war profits tax revenues amounted to $39,252,207 as compared with $27,360,157 in 1916-1917, and $19,439,505 in 1915-1916, these figures all being obtained by conversion of the Australian official returns on the basis of $4.86⅔ to the pound sterling. In Canada business profits were taxed to the extent of $12,506,517 by the Dominion Government in 1916-1917, and $21,271,084 in 1917-1918, but no general income tax collection was made before 1918-1919. The Commonwealth authorities in Australia, even with the close example of New Zealand, were reluctant to resort to income taxation, but were forced to do so early in the war by the very serious shrinkage in imports and the consequent decline of customs revenue. In this connection, Sir Frederick Young, M.P., in evidence before the British Royal Commission on the Income Tax, on May 8th, 1919, said:

"In Australia the Federal tax (i.e. on income) is entirely a war tax. Until the war happened the Federal Parliament deliberately kept out of the income tax sphere, leaving that to the States as a field for taxation, but the imperious necessities of the war altered that and the Federal tax was brought in to help to meet the war bill."

Comparison of Revenues

The first general income tax collection in Australia was in 1915-1916. We are, then, in a position to compare the income tax revenues of The Federal Governments of Canada and Australia for the first three years of operation in each country:

	Australia.	Canada.
First year of general income tax collection	$19,439,505	$43,289,000
Second year	27,360,157	66,492,596
Third year	39,252,207	*77,100,000

*Estimated.

Australia's population is approximately five-eighths that of Canada, and Australia's national wealth and income are probably even higher relatively than the ratio of the populations of the two countries, but the above table proves that, even on the basis of population, income tax collections have been proportionately higher—and by a considerable amount—in Canada than in Australia.

Like New Zealand, but unlike Canada as yet, Australia for some years has been collecting a Federal tax on the unimproved value of land as ascertained by the Government. The yield in 1917-1918 was equivalent to $10,335,724. To this ought to be added the land taxes of the several states amounting to $4,935,685, making a total of $15,271,409. Moreover, although Australia is more highly urbanized than is Canada, the Official Year Book for the Commonwealth shows that slightly more than sixty per cent. of the land tax is assessed on lands in the country, and a little under forty per cent. on lands in towns and cities. In addition, agriculturists deriving income from land mortgages or from stocks or other non-land sources are liable under the Australian income tax law.

Turning to a consideration of the experience of Great Britain, we find that a tax somewhat similar to the income tax was levied in 1798, and the British income tax became operative the following year. The income tax was regarded as essentially a war measure. Evasion of the tax was prevalent and for years the yield was disappointing. In 1816, when the income levy was abandoned, the return was only £14,689,710. The tax was not revived until Sir Robert Peel's Act of 1842. In 1874, Mr. Gladstone, in a manifesto to his constituents, proposed the complete abandonment of the income tax. In 1913-1914, the yield of the British income tax, after 72 years continuous operation was £43,901,763, or about the same amount as the Canadian Council of Agriculture proposes should now be assessed annually upon the people of Canada.

British Income Tax

The British income tax as applied to agriculture is essentially a land tax. Schedule A relates to the ownership of lands and buildings, and schedule B to the occupation of lands. A revaluation of all lands and buildings in the United Kingdom is made under normal conditions every fifth year. Owners of land and buildings are required to pay income tax on the annual value of such property subject to a small deduction for repairs and in addition farmers have to pay income tax on double the annual value of the lands they occupy. The Act provides that if farmers keep books and can prove that their gross income, less only the limited allowances, were less than twice the annual value of the land which they occupy, they can elect to be assessed under schedule B in the same way as manufacturers or tradesmen. Up to 1915 British farmers were assessed on only one half of the annual value of the land occupied by them, but the assessment was raised several years ago to the full annual value and again in 1918, to twice the annual value. For 1918-1919, the British tax on the ownership and operation of lands under schedules A and B was more than $269,000,000, and a very considerable part of this amount was paid by the farmers. But even yet it is claimed that British agriculturists are not paying their fair proportion of taxation. The Association of British Chambers of Commerce, in representations to the Royal Commission on the Income Tax on June 18, 1919, described the present under assessment of farmers as "intolerable" and urged that between £5,000,000 and £10,000,000 additional taxes should be levied annually upon the British farmer, and seriously proposed that the assessment on farmers be raised from two to five times the annual value of the lands occupied.

The income tax experience of the United States is illuminating also. A Federal

tax on the income of corporations was imposed under the Payne-Aldrich tariff law of 1909, but it was not until 1913 that general income taxation was adopted. For 1913-1914 the combined yield in the United States of the corporation excise tax, corporation income tax, and individual income tax was $71,381,275. Relating the yields from income taxation in Canada and the United States for the first three years' collections in each country, we get the following comparison:

	United States.	Canada.
First year of general income taxation	$71,381,275	$43,289,000
Second year ...	80,201,759	66,492,596
Third year	124,937,253	*77,100,000

*Estimated.

The above showing is highly favorable to the Dominion, when it is remembered that the United States' population is at least twelve times as great as that of Canada, and the wealth of the United States from twelve to twenty times as great as that of the Dominion

Returns Disappointing

The initial year of income tax collection in the United States brought collections below the estimates of Treasury officials and were admittedly disappointing. For the year ended June 30, 1914, New York State, with only ten per cent. of the population of the United States, contributed forty-four per cent. of the entire income tax receipts, while New York city alone paid twenty-eight per cent.

The unfairness of the income tax in the United States in falling almost entirely upon the industrial communities is indicated by the statement in the new International Year Book in reference to the 1915-1916 collections under the personal income tax that "students of the income tax returns pointed out that residents in and about New York city paid one-half of the total tax" and that seventy per cent. of the tax was paid by residents of six states—New York, Pennsylvania, Illinois, Massachusetts, New Jersey and Ohio.

An official compilation by the United States Treasury Department of returns for the year 1916 showed that farmers, stock-raisers, orchardists, and other agriculturists, paid only 1.04 per cent. of the entire personal income tax. Analysis of the 1917 personal income tax returns by occupational groups was omitted from the Treasury Department reports, but the later show that less than one per cent. of the total tax on companies was borne by those engaged in agriculture and related industries.

Canadian experience fully bears out the statement that income taxation is largely a tax on the industrial population and that the agriculturists escape all but a very small part of the burden. This is not a reflection on the honesty of the farmers. But comparatively few farmers keep books, and unlike the people in cities, they do not consider "house and keep" as part of the revenue derived from their farming operations. Then, too, in the newer districts particularly, a substantial part of returns from agriculture is represented by the enhancement in land values and such increase is not reached by the income tax. It is undoubtedly true that some farmers are most conscientious in making out their income tax returns, but there are many others who do not make proper returns. Answering questions put on the order paper by Sir Herbert Ames, Sir Thomas White stated in the Canadian Parliament on May 5, 1919, that the aggregate assessment under the Income War Tax Act of 1917 of all persons giving their vocations as farmers or stock-raisers, was $417,349, out of a total assessment, aside from the Business War Profits Act, of $10,031,094. Even these amounts, however, were not all paid during the fiscal year 1918-1919, as the Public Accounts show income tax collections during that year of $9,349,719. Assuming that the proportion of collections to assessment apply about equally to all classes, the farmers would have paid an aggregate of only $389,011, while the balance of the income tax must have been paid by the non-agricultural population. The proportion paid by the farmers is still less when one considers that agriculturists are expressly exempt from the Business War Profits Tax, and that the burden of direct Federal war taxation borne by the non-agricultural population during the fiscal years 1915-1919 was $83,379,099, as compared with $389,011 paid by the agriculturists.

Agriculturists' Profit

Again, a Government return, published in the Canadian *Hansard* on May 10, 1920, showed that for the fiscal years 1918-1919, and 1919-1920, income tax collections in the counties of Leeds, Frontenac, Lennox and Addington, Prince Edward, Northumberland and Peterborough, totalled $426,251, of which $421,957 was paid by urban dwellers and only $4,294 by those in the rural districts. The census of 1911 reported the rural population of these counties at 105,109, while the urban population was only 47,135. In other words, the urban population, although less than one-third of the whole paid 99 per cent. of the tax.

Mr. W. F. Cockshutt, M.P., speaking in the Canadian Parliament on May 28, 1920, gave figures which apparently were official. He said: "In Ontario, with 183,000 farmers, I am told that there were only 314 who made returns . . . . . I am told further, by the Commissioner of Taxation, that in the City of Toronto, which is stated to contain a large body of defaulters, there was more income tax paid in one particular year than by the three western provinces of Canada added together."

At several hearings of the present Tariff Committee, the chairman has given interesting information relative to the income tax collections in Canada. At Calgary, on October 4th, he told a witness that only 1,277 farmers in the Province of Alberta paid income tax last year. The population of that province is officially estimated at 587,770, and is predominantly agricultural.

Few Farmers Pay

At Regina, on October 11th, the Minister of Finance stated that only 2,277 out of the 120,000 farmers in Saskatchewan were income tax payers. In all Canada there are only 6,490 farmers who are paying any Federal income tax. For every farmer who pays income tax to the Dominion, there are 16 non-agricultural income tax payers. Last year, out of $18,085,977 paid in income tax, exclusive of back payments, only $400,000 —slightly more than two per cent.—was contributed by farmers. If we consider the total collections last year on account of Federal taxation of incomes amounting to $66,492,596, the agriculturists, who represent one-half of the entire population, paid only $400,000, or about three-fifths of one per cent. of the total. In fairness to the Canadian Council of Agriculture, it ought to be said that the Council did not have these figures at the time they incorporated in their platform a demand that the income tax be employed as a substitute for the tariff as a means of raising national revenue.

Nor can this record be justified on the ground that the agriculturists of Canada are not able to pay a larger proportion. Mr. R. H. Coats, Dominion Statistician, in an article in the *Monetary Times*, January 3, 1919, estimated the entire national wealth of Canada at $16,000,000,000, and the agricultural wealth at $6,830,145,000. He also valued the gross production of Canada in 1917 at $4,425,788,125, and of this $1,621,028,000 was accounted for by agriculture. This means that at the present time, so far as direct Federal taxation is concerned, the agricultural wealth, representing between 40 and 50 per cent. of the whole, is making practically no contribution, while the non-agricultural wealth is paying a substantial tax.

From another angle, one may well question whether the incidence of income taxation in Canada is equitable, except

when such levy is supplementary to other taxation. Official records show that there were only 99,768 income tax payers in Canada out of a population officially estimated at almost 9,000,000. Moreover, 6,699 taxpayers paid no less than 82.15 per cent. of the taxes, while the other 93,069 taxpayers contributed only 17.85 per cent. Surely by attempting to give to income taxation the place of first importance in our revenue system, there is serious danger of placing in the hands of voters, who contribute nothing to the expenses of government, control over national policies and national expenditures.

Where the Burden Falls

The burden of taxation upon the non-agricultural population of Canada is now about as heavy as can be imposed without endangering a collapse of the entire structure. The Minister of Finance in his last budget speech admitted that it would be hard to find any argument which would justify the continuance of the Business Profits War Tax under normal conditions. The estimated yield of that tax this year is $4,000,000 less than the return for 1919-1920. This element in our revenue system cannot be continued indefinitely. With the Business Profits War Tax withdrawn, corporations would still be taxed under the Income Tax Act, but the readjustment of prices and other developments consequent upon a return to more stable conditions threaten seriously to curtail the revenue from this source.

Yield Must Increase

Federal income taxation under all headings yielded, as has been shown, $66,492,596 last year. To treble that amount immediately, or within a year or two, without any increase in rates, in the face of falling prices and more or less uncertainty in business of all kinds, is the task set by the Canadian Council of Agriculture. To state the proposition suffices to show how impossible it is of realization. For the current fiscal year the estimated yield from these sources is slightly more than $77,000,000, but to increase such revenue by 123,000,000 annually under present conditions, by improvement in administrative machinery alone, cannot reasonably be expected. Nor does the income tax experience of other countries, as reviewed above, support the contention that the income tax in Canada could be made to yield $200,000,000 annually at the present time. The Secretary of the Canadian Council of Agriculture has recently put forward the request that the income tax be levied, not on the income of an especially good year, but on a three years' average, following the principle in force in Great Britain. If adopted, such change would tend still further to reduce the revenue which could be derived under normal conditions by taxation of incomes.

Where Income Tax Fails

Students of taxation generally have recognized that income taxation cannot successfully be applied to rural communities and that it must be supplemented by some compensating levy on the rural population, if all are to contribute to public revenues in proportion to their ability to pay. In fact the income tax is favorably regarded now, as in the past, mainly as a tax supplementing other means of raising revenue.

In this connection the Assessment and Taxation Commission of the Province of Manitoba has collected valuable evidence. The Commission was appointed on July 26, 1918, and included representatives of the Grain Growers as well as of other interests. In a report, dated December 27, 1919, and signed without reserve by Mr. Peter Wright for the agriculturists of Manitoba, as well as by the other members of the Commission, the statement is made frankly that the income tax "is primarily an urban tax, the rural communities contributing only a small percentage of the yield." The report adds: "This is in accordance with general experience, and with the views of the leading authorities who are agreed that income tax administration is least effective in purely agricultural communities." The opinion is also expressed that, in any taxation system which aims at distributing the burden in proportion to ability to pay, "it will always be necessary, however, to supplement income by other criteria of faculty."

Experience of Wisconsin

Mr. Thomas E. Lyons, a member of the Wisconsin Tax Commission, is quoted as follows, in part:

"Experience thus far has shown that the principal yield of the income tax comes from the centres of business and population. It is, therefore, primarily an urban tax. Milwaukee City alone contributes over 40 per cent. of the taxable income assessed, and fifteen counties, containing the principal cities, furnish 75 per cent. of the total for the State. Less than one-half of one per cent. of the population in strictly rural districts is subject to the tax, and the yield is comparatively insignificant. . . . ."

The special Commission of the State of Nebraska on Revenue and Taxation has reported that the income tax is an essential aid in bringing about an equitable apportionment of the tax burden "among peoples well advanced industrially."

The State Tax Commission of Nort Dakota, in a recent report, favored land tax, supplemented by an income ta as a means of raising State or Provi cial revenue. The Commission added "Public financiers have never been abl to apply an income tax to land with an thing like satisfactory results. It ha been attempted time and again, but wit indifferent success."

Professor T. S. Adams, of Yale Unive sity, is quoted as stating: "The incom tax yields little or no revenue in rur or farming districts, and for that reaso I would not recommend it to farmin communities; but for thickly-settle manufacturing and urban communitie it is bound to spread and in the end supplant the relatively unjust and unfa tax on personal property."

The Manitoba Commission

The Manitoba Commission commen that Professor Adams' statement "seen to be the prevailing opinion ever where." It points out that in the i come tax provisions of Ontario, the i come of farmers derived from the pr duce of their farms is express exempted from taxation under the i come tax law. Presumably the referen is to the assessment legislation of O tario. The Commission adds: "We ha carefully and fully considered this f ture and recommend that the provisio of any general income law that may enacted in this Province be confin wholly and exclusively to urban co munities."

In view of this evidence, issued un authority of a representative commiss and accepted by the delegates of Grain Growers on that Commission, a demand for increased levies under Canadian income tax law, without at same time advocacy of a supplement measure of taxation upon the rural po lation, would be viewed by the people the cities and towns, as a demand discriminatory class taxation.

Great Britain, Australia, New Zeal and certain other countries where come taxes are in force, collect from farmers what is in fact a land tax. the basis of the New Zealand return Federal land tax of not less than $ 000,000 ought to be imposed in Can if a thorough-going system of di taxation is to be adopted, and on Australian basis, not less than $30,0 000 of this would have to be paid agriculturists, in addition to a tax their income derived from sources o than the use and produce of land. a land tax would mean on the aver a direct Federal levy of more thar cents per acre for every acre of f lands, or a tax of between $40 and per year on every farm in Canada, ir

dition to all taxes already paid. If capitalized, the tax would reduce the value of the average farm by from $500 to $1,000. On the larger farms the tax would, of course, be much larger than the average for all Canada.

Opposition to Land Tax

There appears to be widespread opposition, however, on the part of agriculturists in Canada to imposition of a Federal land tax. Sir Lomer Gouin, speaking for the Government of the Province of Quebec, last January, said:

"I was speaking this afternoon in the House of Assembly on a question which was raised by some of our members in favor of an increase of our employees' salaries. I was telling my colleagues that if they were to increase our expenditure they must find some new revenue, and I thought it was apropos to tell them that the last tax they should think of was the land tax. I beg permission to repeat to you, gentlemen of Canada, that such a tax imposed by Ottawa would be disastrous to our country. The day that you will tax the land, Sir, you will discourage our farmers, you will ruin the provincial administrations and soon afterwards, believe me, we shall have to prepare for a change in the destinies of our country."

Hon. Duncan Marshall, Minister of Agriculture, for Alberta, when asked at Edmonton by the Chairman of the Tariff Committee whether he would favor a direct Federal land tax, replied: "I would not. I am opposed to a direct land tax by the Federal Government." Such appears to be the preponderating sentiment in the agricultural communities.

Direct Taxation Proposed

The Canadian Council of Agriculture is of the opinion that a substantial saving in the cost of collecting revenue would result from substitution of direct taxation for the present fiscal policy. The cost of collection of Canadian customs revenue was 2.51 per cent. in 1917-918, and 3.13 per cent. in 1918-1919. The ost of collecting the British income tax n 1918-1919 was close to $15,000,000, or pproximately 1 per cent. The tax on ncomes under £250 costs no less than ½ per cent. to assess and collect. The ritish income tax is administered by housands of officials in a great organizaon developed by several generations' xperience. At the head is the Chancelr of Exchequer, and, answerable to him e Board of Inland Revenue. Then come 5 bodies of General Commissioners, ith a total of 5,600 General Commisoners. Of surveyors, assistant surveys and inspectors there are some 1,225. hen come 4,500 assessors and about 00 collectors. Besides the officials entioned there are Special Commissions, Additional Commissioners, Departental Commissioners, and a separate income tax organization for Ireland, besides a great number of clerks. If British experience teaches anything, it is that income tax administration means a large and expensive organization—and even with such organization and a century's experience, it is officially admitted that £60,000,000 annually is lost through evasion, while Sir Leo Chiozza Money estimates that evasion of income tax (and super-tax) keeps as much as £100,000,000 from the Treasury annually. With administrative problems far more difficult than those in the United Kingdom, with a tremendous area and sparse population to cover, and with a much smaller revenue to be collected here, Canada's income tax expenses under a thorough system cannot be expected to be much under 3 per cent. Moreover, it must be recognized that a collection of $200,000,000 by direct taxation of incomes, would not make possible the entire abandonment of tariff revenue. But even if this country went on a free trade basis, customs organization still would have to be maintained practically in its entirety. No doubt some reduction in staff would result, but the saving would be much smaller than the Canadian Council of Agriculture appears to contemplate.

Objections

Then, too, if income taxation were elevated to the foremost place in the Canadian revenue system, there is reason to believe that it would prove disappointing to those who look to direct taxation to correct injustices in the present system and provide an ideal revenue source. Wherever the income tax has been employed it has been accompanied by evils at least as flagrant as those found under almost any other revenue system. The income tax has been in force in the United Kingdom, except for periods, from 1779, and yet in 1905, Mr. Stoodley, one of the secretaries to the Board of Inland Revenue, admitted that the Department was in possession of evidence "showing that grossly insufficient returns, or no returns at all, were made over long periods of years with impunity, the probability of detection being slight until some event occurred to bring the facts to light, such as the death of the taxpayer, the conversion of a private business into a limited company, or a claim being made for compensation for disturbance based on the profits." The minutes of evidence before the British Royal Commission on the Income Tax, 1919, are replete with grievances of inequitable incidence. Salaried workers complain that they suffer by reason of evasion of the tax by those who are better able to escape their rightful contribution. Industrial interests protest that the agriculturists are not taxed in proportion to their ability to pay. There has been widespread dissatisfaction that large numbers of artisans, earning good incomes, pay no tax. The fact that foreign producers, paying no income tax to the British Government, are able under the present fiscal policy of the United Kingdom to profit by the British market, in competition with British producers who are taxed upon their entire earnings, has caused much irritation. Direct taxation in Great Britain—and there it has found its highest development—is far from free of anomalies and imperfections. After reading the evidence before the Royal Commission, one may well question whether, from considerations alone of the efficiency in revenue collection, approximate equity in distribution of the burden of taxation, and the mildness of incidence (especially in view of the fact that in many cases import customs duties are absorbed wholly or in part by the exporter) the customs tariff is not preferable to the income tax as a means of collecting a large part of the national revenue. The income tax, supplementing the customs tariff, provides a well-rounded fiscal system which supplies revenue on a basis as equitable as has yet been devised. The income tax has much in its favor as a supplementary tax, and is especially useful in time of emergency, by reason of its elasticity, but as a main revenue resource, under normal conditions, it fails to satisfy the recognized canons of equity in taxation. Speaking from wide experience, Mr. D. M. Kerly, Chairman of the Board of Reference set up in connection with the British Excess Profits duty, who was also a member of the Royal Commission on the Income Tax, 1919, recently made this significant statement:

"We have had several witnesses here who have told us that the income tax is a very excellent tax, and some have suggested that it should be the only tax. Each of the witnesses I have in mind represented large bodies of persons who would pay no tax at all, and therefore, their statement came to this, that the Income Tax was an excellent tax for other people to pay."

C.C. of A.'s Proposals

The Canadian Council of Agriculture in its official platform proposes that direct taxation be imposed—

"(*a*) By a direct tax on unimproved land values, including all national resources."

The possibilities of such a tax have been analyzed above. It is of the greatest importance, that the agriculturists realize that the larger part of such levy

(*Continued on page* 140.)

Reply to the Arguments Advanced for the Reduction of the Tariff

Statement Presented by the Canadian Manufacturers Association to the Tariff Commission at Winnipeg on October 14th, 1920

AT the opening session of the Tariff Commission at Winnipeg on September 14, the Canadian Manufacturers Association presented a general statement advocating the maintenance of the present fiscal policy of Canada. It is respectfully submitted that while the policy advocated has been opposed, the facts contained in this statement have not been refuted.

During the sessions of the Commission following the Winnipeg sitting, those who advocate a reduction of the Canadian Customs Tariff have used general lines of argument.

In the first place, statements have been made describing the hardships suffered by farmers in the Prairie Provinces, which are doubtless accurate in regard to those farmers who are operating in the dry belts, or who have had a succession of crop failures due to climatic conditions, but it can scarcely be claimed that the experiences of these particular farmers are representative of Canadian agriculture, the prosperity of which, we believe, compares favorable with that of the best agricultural countries in the world.

In the second place, the necessity of bringing under cultivation the vast area of arable vacant lands has been repeatedly urged. With this view, all classes of people in Canada will surely agree, because the importance of such action is self-evident. However, a similar problem confronts other partially settled countries, such as Australia, Argentine Republic, and Brazil, all of which maintain customs tariffs higher than that of Canada. These countries maintain such tariffs in the belief that it is necessary to assure the larger proportion of the home market to home producers in order to encourage well-balanced national development..

The charge that Canadian manufacturers take advantage of the Customs tariff to enhance the prices of their goods to consumers, which has been circulated for a number of years, has been repeated at various sittings of this Commission. These charges, as usual, have been made in general terms and have not been supported by proof in any case. Having been given the opportunity afforded by the sessions of this Commission to produce definite proof in support of vague allegations, we think that it is reasonable to suggest that such allegations should not be made in future unless supported by the name of the company, name of the article, and full information in regard to comparative prices, and specific dates of transactions. While those who have made these charges have contented themselves with general statements; on the other hand, at the various sessions of this Commission, information has been produced by manufacturers, supplemented by comparative prices, to show that their prices at Canadian points are considerably lower than United States delivered prices; and moreover many cases were filed showing where the Canadian prices at Canadian points are lower than the United States prices for the same class of goods in corresponding United States territory. It has been demonstrated that these Canadian manufacturers have been able to sell at such prices because the Customs tariff assures them a substantial proportion of the home market, and thus makes it possible for them to produce in large quantities. Conversely, it was shown that if the tariff were removed, and the Canadian home market largely flooded with goods from other countries, while Canadian goods were practically excluded from these other countries by existing tariffs, Canadian manufacturers would have their quantity production decreases, and their operating costs per unit consequently increased until they would find it impossible in many cases to continue operations.

In this brief, which was read by J. R. K. Bristol, Manager of the Tariff Department, C.M.A., an answer is given to the contention that manufacturers make use of the Tariff to enhance the prices of goods to consumers, and that manufacturers are the only class who are protected by the Canadian Customs Tariff.

It has been inferred at these hearings that the manufacturers are the only class who are protected by the Canadian Customs Tariff. In reply we refer to the following items of the tariff which show that duties are imposed on many farm products; consequently the farmers who produce these products are protected from the unfair competition of the farmers in other countries:

Tariff Item.		British Preferential.	Intermediate tariff.	General tariff.
4	Horses, over one year old, valued at $50 or less per head, each	$10 00	$12 50	$12 50
5	Animals, living n.o.p. (i.e. other than live hogs and animals for improvement of stock)	15%	22½%	25%
6	Live hogs, per lb. . .	1c	1¼c	1½c
9	Poultry and game other than canned. .	12½%	17½%	20%
16	Eggs, per doz.	2c	2½c	3c
18	Butter, per lb.	3c	4c	4c
35	Hops, per lb.	4c	6c	7c
47	Beans, n.o.p., per bus.	15c	22½c	25c
48	Peas, n.o.p., per bus.	10c	12½c.	15c
49	Buckwheat, per bus.	10c	12½c	15c
52	Barley, n.o.p., per bus.	10c	12½c	15c
54	Indian corn for purposes of distillation, per bus.	7½c	7½c	7½c
56	Oats, per bus.	7c	9c	10c
58	Rye, per bus.	7c	9c	10c
60a	Wheat, when imported from a country which imposes a customs duty on wheat grown in Canada, per bus...	8c	12c	12c
69	Hay and straw, per ton	$1 65	$1 75	$2 00
70	Flax seed, per bus..	7½c	10c	10c
71	Seed of timothy and clover	5%	10%	10%
71a	Field and garden seeds not specified as free, valued at not less than $5 per pound, in packages, weighing not less than one ounce each	5%	10%	10%

Tobacco—Canadian growers are protected by the amount of excise duty payable.

Besides, being protected in the home market on most of their farm products

Canadian agriculturists can import certain commodities such as binder twine, light tractors, cream separators, etc., free of duty and the duties on farm machinery and supplies in general are the lowest in the Canadian tariff schedules.

We beg to deprecate the assumption that certain Saskatchewan newspapers have made to the effect that the tariff problem aligns the manufacturers on one side in opposition to the farmers on the other. During these sessions of the Tariff Commission, in addition to the manufacturers, fishermen, lumbermen, coal operators, wholesale merchants, farmers' organizations, and others have appeared and declared their support of the policy of protection. In British Columbia, the British Columbia Fruit Growers' Association declared in favor of the present tariff on their products; the British Columbia Seed Producers' Association asked that certain articles in the free list produced by them be protected; the Fraser Valley Milk Producers' Association asked that their present protection be maintained, and the United Farmers of British Columbia endorsed the resolution of the British Columbia Fruit Growers' Association asking for the maintenance of the tariff on fruit, that is, in British Columbia. Practically all the farmers of the province, through their respective organizations, asked for tariff protection.

Throughout the hearings, the official representatives of certain of the farmers' organizations seemed anxious to avoid the charge that they are free traders. It is not alleged that the farmers of Canada are all free traders, or that the majority of them are free traders; in fact, the history of the last forty years indicates that the majority of farmers have consistently supported the policy of adequate protection for home industry, including farming; but we wish to show from an analysis of the official platform of the Canadian Council of Agriculture drafted and issued at Winnipeg on November 29, 1918, how far the tariff policy enunciated in that platform goes in the direction of free trade. The preamble to the definite tariff demands of the platform reads as follows:

"Therefore be it resolved that the Canadian Council of Agriculture, representing the organized farmers of Canada, urges that, as a means of remedying these evils and bringing about much-needed social and economic reforms our tariff laws should be amended as follows:"

(a) "By an immediate and substantial all-round reduction of the Customs tariff."

It should be noted that the reduction requested is to be "immediate" and "substantial" and "all-round." What is meant by these terms in percentages? Taken literally, the clause advocates a long step towards free trade.

The second demand reads as follows:

(b) "By reducing the Customs duty on goods imported from Great Britain to one-half the rates charged under the general tariff, and that further gradual, uniform reductions be made in the remaining tariff on British imports that will ensure complete Free Trade between Great Britain and Canada in five years."

Here is a definite demand for complete free trade between the United Kingdom and Canada, and is the second step towards complete free trade. During the fiscal year ending March 31st, 1919, the duty collected on goods imported from the United Kingdom amounted to $11,164,989. Owing to the war, imports from the United Kingdom fell away after 1914 from the high water mark reached in 1913, when the duty collected on United Kingdom goods rose to $27,158,162. Consequently, as imports from the United Kingdom are rapidly increasing, free trade would eliminate a considerable portion of the revenue of the Dominion Government.

The third demand reads as follows:

(c) "By endeavoring to secure unrestricted reciprocal trade in natural products with the United States along the lines of the Reciprocity Agreement of 1911."

"Unrestricted reciprocal trade" in these products would constitute the third step in the direction of free trade.

The fourth demand reads as follows:

(d) "By placing all foodstuffs on the free list."

It is difficult to determine exactly what is included under the term "foodstuffs," but it is submitted that the following list may be taken as fairly accurate:

Arrowroot.
Biscuits, unsweetened.
Biscuits, sweetened.
Butter.
Beef, fresh.
Beef, salted in barrels.
Bacon and hams cured.
Baking powder.
Barley.
Pearl barley.
Beans.
Buckwheat.
Buckwheat flour.
Brand and mill feed.
Chicory, green.
Chicory, roasted.
Coffee, green, n.o.p.
" green, imported dried.
" extract.
" roasted, not imported dried.
" other.
" condensed with milk.
Cocoa, beans, not roasted, crushed or ground.
Cocoa shells and nibs.
Cocoa paste, unsweetened in blocks.
Cocoa paste, sweetened.
Confectionery, not containing cocoa or chocolate.
Other confectionery.
Cereal food in packages.
Cereal foods, n.o.p.
Corn for distillation.
Corn meal.
Cheese.
Cocoa butter.
Cider, raw.
Cider, clarified.
Corn, canned.
Eggs.
Fruits, preserved in brandy, etc.
Fruits, canned.
Fruits, dried—apples, currants, dates, figs, prunes and others.
Fruits—all kinds, including apples, apricots, pears, quinces, blackberries, gooseberries, raspberries, strawberries, cherries, cranberries, currants, grapes, lemons and limes, melons, peaches, plums, fresh tomatoes, raisins, etc.
Fish.
Gelatine.
Grain, damaged.
Glucose, and grape sugar.
Ginger and spice, unground.
Ginger and spice, ground.
Ginger preserved.
Hops.
Hominy.
Honey.
Hay.
Jellies and jams.
Lime juice, crude, containing more than 25 per cent. proof spirits.
Lime juice, refined only.
Lard.
Lard compound.
Liquoria.
Mustard, ground.
Mustard, French liquid.
Molasses, testing under 35 but not under 20 degrees.
Molasses, over 56 degrees.
Molasses in original packages, produce of foreign countries.
Macaroni and vermicelli.
Malt.
Malt flour.
Malt extract and grain molasses.
Milk food.
Milk and cream, fresh.
Milk, condensed.
Mutton, fresh.
Pork, fresh.
Pork in brine.
Other meats, fresh.
Other meats, salted.
Meats, dried.
Meats, canned.
Meat extracts.
Nutmegs, unground.
Nutmegs, ground.
Nuts of all kinds.
Oats.
Oatmeal.
Olives, in brine, in bulk.
Olives, bottled.
Pickles, bottled.
Pickles, in bulk.
Potatoes.
Potatoes, sweet.
Peas.
Sugar cane, shredded.
Sugar, not above 16 Dutch standard.
Sugar, above 16 Dutch standard.
Syrup and molasses, n.o.p.
Rice.
Rice and sago flour.
Rye.
Rye flour.
Sago and tapioca.
Starch, corn, farina, etc.
Sausage casings.
Straw.
Sauces and catsup, bottled.
Sauces and catsup, in bulk.
Sauces (soy).
Canned tomatoes.
Tapioca flour.
Tea, all kinds.
Vegetables.
Vinegar.
Yeast cakes.
Yeast.
Other bread stuffs.

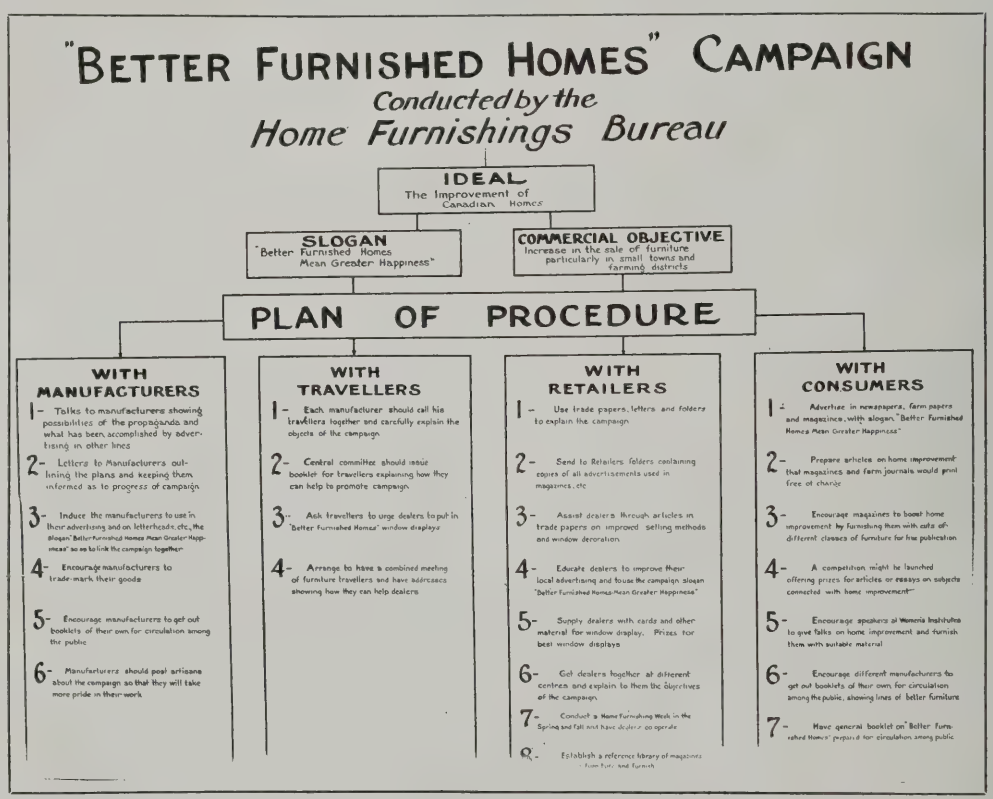
The Better Furnished Homes Campaign



The Plan of the Home Furnishings Bureau—Improving Canadian Homes by Advertising—Increasing the Sale of Furniture by Raising the Public Taste

By J. L. CHARLESWORTH

GREATER happiness! The person or persons who are honestly trying to bring that about are deserving of more than passing interest. The ideal of the Home Furnishings Bureau definitely puts it in this class. "Better furnished homes mean greater happiness," declares its slogan, and as a consequence the ideal is the improvement of Canadian homes.

What is the Home Furnishings Bureau and how can it carry out its plans? are natural questions to ask. The answer to the second is advertising, details of which will be given below. For the first question one must turn back the calendar some six months. The problem of furniture manufacturers has always been the securing of popular appreciation for good work. Every home owner wants his house to be a thing of beauty, but not everyone knows how to make it so. To Mr. Cawkell, secretary of the Furniture Manufacturers Association came the idea that the educational influence of group advertising might do a great deal of good in this direction. The James Fisher Company, Limited, were called into consultation and they drew up the plan of procedure that is shown on this page. The scheme was then presented to a number of furniture manufacturers, and a committee was appointed to look after the details. On this committee are G. W. Gibbard, of the Gibbard Furniture Company, Limited, Napanee, Ont., who is chairman; J. H. Baetz, of Baetz Bros. Furniture Company, Limited, Kitchener, Ont.; W. J. Anderson, of the Stratford Chair Company, Limited, Stratford, Ont.; George Hughes, of the Gold Medal Furniture Manufacturing Company, Limited, Toronto; A. A. Schreiter, of the De Luxe Upholstering Company, Kitchener, Ont., and W. Cawkell, secretary of the Furniture Manufacturers Association. Their deliberations led to the establishment of the Home Furnishings Bureau, with T. Lyle Blogg as manager.

With the organization completed the plan of campaign remained to be worked out in detail. The diagram of this plan is reproduced here. It will be seen that for the purposes of the movement, four lines of endeavour were to be considered; work with manufacturers, travellers and retailers, whose co-operation was essential to the success of the plan; with consumers, because they are the ultimate judges of everything.

Disposition of the Home Furnishings Bureau's Advertising Forces

Manufacturers are seeing the possibilities of group advertising. In the case of furniture a general demand must be created before it is any use advertising a particular line. This general demand can be more strongly influenced by a co-operative campaign than by individuals, if only for the reason that the funds are greater. The furniture manufacturers have been shown what similar advertising in other lines has accomplished and their support of the present movement has been secured.

Travellers are a force that can be used effectively. The traveller from the very nature of his profession must be a persuasive talker and a friend of the retailer. Continually on the move from place to place, he picks up a number of good ideas about methods of selling. These he passes on to the retailer, who is glad to receive the suggestions of wider experience. When the traveller explains to the dealer what the "Better - Furnished Homes" campaign is, the latter is likely to co-operate readily with the Bureau.

Letters and folders explaining the campaign and showing copies of advertisements to be used are going out to retailers. Articles inserted in trade papers to show what improvements can be made in selling methods and window decoration, and a supply of material for window display, with prizes offered for the best efforts, are developments under consideration.

To make sure that all three classes manufacturers, travellers and retailers will work together for the achievement of the Home Furnishings Bureau's ideal meetings are being called at various centres. Here the audiences are addressed by a speaker, who shows what part they can and should play in the

campaign, and the benefits they will derive from it. In addition a reference library of books and magazines dealing with furniture and decoration is being established, so that dealers may consult authorities on matters affecting their business.

That, briefly, is the disposition of the advertising forces which are being brought to bear on the ultimate consumer. In this case every adult in Canada may be looked upon as a possible consumer, for everyone dreams more or less of having a home of his own. But, in the main, the people whom it is necessary to reach are those who already have homes, and might be induced to furnish them more artistically.

Reaching the Farmer

In the cities, where ideas are more quickly disseminated, and examples of well-furnished homes are more numerous, the need for missionary work, while it exists, is not so pressing as in the rural districts. It is on the farms and in the smaller towns of Canada, that one sees the imperative necessity for education in decorative art. That is why the advertising of the Home Furnishings Bureau is being distributed among eleven farm papers and seventy-four Ontario weeklies as well as about 50 daily papers. These go to the rural districts of the Dominion where the need of properly furnished houses is most urgent.

"How ya gonna keep 'em down on the farm?" inquires a once popular song. The dainty lyric expresses a real problem, though probably few who have sung and jazzed to the tune have taken it very seriously. The only possible solution is to make the farm as attractive as the city, and art, like charity, begins at home.

Victorian Horrors

Do you remember the typical Canadian drawing-room of a few years ago, A room hermetically sealed except when "company" called, or weddings and funerals occurred. Here reposed in somnity and gloom the best furniture, covered with good, durable, shiny, slippery horsehair. The walls made some pretence at gaiety, for flowered paper covered them, and they supported crayon portraits of the heads of the house. In one corner stood a "what-not" containing seashells, souvenir spoons, old Christmas cards—all the rubbish that people collect and hate to throw away. The black walnut centre table, with the family Bible and the photograph album, completed the picture. The officials of the Spanish Inquisition might have been able to design a better torture chamber, though it is doubtful. Any comparison between them and the inventors of the Canadian parlor must nevertheless be in favor of the former; the Inquisitors at least had imagination.

Luckily in the cities we have done away with this kind of room. It is, unfortunately, still to be found in many farm houses. Remember that it is the best room in the house, too good to be used except on state occasions. Can it be wondered that there is difficulty in getting people to go on the farms or to stay if the accident of birth places them there? The problem of rural depopulation is to a large extent the problem of house furnishing.

For this reason the advertisements are designed to carry a special message to the farmers. One of these tells the too-familiar story of the prosperous farmer who invests his profits in barns and machinery instead of in his home. The children leave the farm as a matter of

A Specimen of the Advertising being used to establish the idea of "Better Furnished Homes

course. The reason is found on the father's death when an inventory of the estate is made. The household effects are valued at only five hundred dollars.

Another medium that can be used is the Women's Institute. This society frequently forms the social centre of a rural district and members attend the meetings to hear a lecture on some subject connected with their daily lives. It is hoped that some speakers may be induced to choose home improvement as a subject. The Home Furnishings Bureau will be prepared to supply material for such a lecture.

As a supplement to the work of the Bureau, individual manufacturers are being induced to send out booklets showing better lines of furniture. Retailers will receive suggestions calculated to improve their local advertising. They will be asked to run their own advertisements next to the general advertisement, so that the reader will notice where he can buy furniture at the same time as he is learning about its importance. Above all, retailers and manufacturers are being encouraged to use the campaign slogan, "Better Furnished Homes Mean Greater Happiness." This links them all together in support of the movement.

The Advertisements

One must admit that the organization is almost flawless; the advertisements are visible proof of this. One has been reproduced here, not because it is the best of the series, but because it is typical of several outstanding feaures of the campaign. The design is striking; a frame of carved wood suggesting a mirror, the lines of which carry the eye up to the picture of a charmingly furnished bedroom. Below this is the caption in lettering calculated to be effective without unnecessary obtrusiveness. It is imperative—"Make your home worthy of your own good circumstances." The reader whose attention has first been caught by the pictured room mentally compares it with some room in his own house. The importance of furniture may not have occurred to him before. He reads the argument, and comes to the same conclusion that is stated in italics at the bottom—"Better Furnished Homes Mean Greater Happiness."

Another advertisement of the series approaches the subject from a similar angle, but the appeal is to the desire for national rather than individual happiness. The caption here reads, "Let the homes of Canada reflect the nation's prosperity." When one comes to think of it, what better symbol of prosperity than a well-furnished home can be found? No civilization is worthy of the name unless the people who possess it are living under conditions that make for happiness. Where there are a few mansions and thousands of hovels trouble is bound to come.

Prosperity Justifies Comfort

In Canada, where there are neither the great fortunes nor the great poverty that characterize some European countries, there is not the unrest that is prevalent there. Canadians can always look forward to owning their own houses, and should be willing to make them beautiful. To quote from the advertisement, "the individual earnings of Canadians are greater than those of almost any other race. We are living in prosperous times, and in a country with a glorious future. The new era commencing with the close of the war is proving to be the most progressive and prosperous in the history of the Dominion, and Canadians can well afford to brighten up their homes with better furniture."

The Home Furnishings Bureau is not an ephemeral organization; as its ideal is the improvement of Canadian homes there will always be work for it to do. At present its activities are confined to showing the part furniture plays in an attractive home. Later it will turn people's attention to other details, rugs, curtains, lighting fixtures, etc. The point at issue is the elevation of taste and that cannot be accomplished in a day.

One particular feature in the campaign is the Home Furnishing Week. Throughout the year the objects of the Bureau will be kept before the public eye by advertisements inserted in various papers two or three times a month. In Spring and Fall, when people are housecleaning and redecorating, the Bureau will have a week of intensive advertising. Manufacturers will also run special advertisements and retailers will co-operate with window displays. The success of the Home Furnishing Week will be a gauge for the value of the whole campaign.

Compare Shoe Manufacturers

It is natural to compare this advertising with that of the Shoe Manufacturers' Association. In the latter case the purpose was not to create a demand for shoes, but to get justice for Canadian-made footwear. In the "Better Furnished Homes" campaign, the first thing to be done is to create a demand for furniture of better quality. When this is done it will be time to emphasize the merits of Canadian-made furniture.

The advertising of such an article as furniture must be continuous since most people think of it as a luxury. With the shoe manufacturers all that was required was to bring their case before the public. If necessary it can be done again a no advantage is lost in the interval. the Home Furnishings Bureau were drop its advertising for a few months would have to cover the same grou again when it resumed operations. campaign is a process of education. T of the shoe manufacturers is the pres tation of a few simple facts.

Group Advertising

Both campaigns are illustrative of value of group advertising. The prov that two of a trade can never agree longer holds good. All manufacturers the same article have a great deal in c mon. The matters they wish to br under the limelight may not all be same, but there are sure to be eno to make a common cause. It is m efficient to give publicity to those mat through combining forces. The

T. Lyle Blogg

Manager of the Home Furnishings Bu

dividual manufacturer saves his ve tising space for the facts that he w he to emphasize about his own part ia product. The general advertising ok after the more general ideas.

The advertising of a group can ea over a greater area than that a individual and is proportionately mo effective. If each manufacturer w e paddle his own canoe and adver e the same papers that they use as a ou he would get little better result tha would be gained from the insertio of single advertisement. The expe e them all would be multiplied t th number of advertisers.

Again, group advertising is a igna benefit to the small manufacturer hos business will not justify a large ppr priation for publicity campaigns. Nov

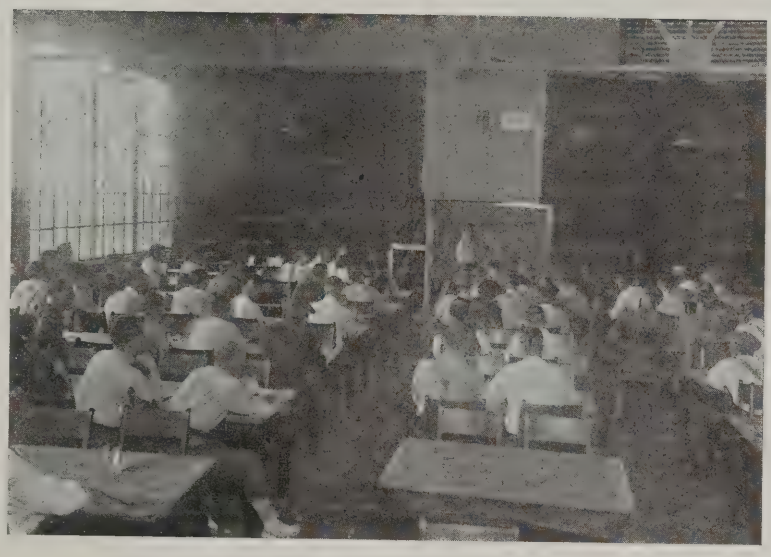
This School Goes Right into the Factory and It's a Success, too

By LYMAN B. JACKES



AM I prepared to go down amongst the nployees of my factory or op and ask them ques-ons relative to finance, ysics, mathematics or e nature and source of e raw materials they e working into finished oducts?

That is the question to ep on the horizon of the ion when considering s "School" which comes ht into a Canadian fac-y and during its short eer of six months has tified its continuation.

The subject of education always a difficult topic consideration to the ker forced from school ing the most receptive iod of life; however, the germ of er things is there. Judging entirely n the overflow of workers applying admittance to various night schools, s quite safe to presume that a great entage of Canadian factory workers ld develop symptoms of the learn-fever if they could be bitten by a -work.

ght schools fill a great need in the of any community but they have two ivantages. The machinery for keep-interest alive between employer and oyed, is defective and the time re-d for attendance cuts deeply into worker's out-of-business hours and to his already strained budget of ses. Then, too, there is the feeling ncertainty. The attending workman that he is taking all the risk with defective lines of approach to the rities in the factory who might cnize his efforts to improve his .

school which is to be described serious attempt to overcome the s of the above. The management he curriculum. The teachers are known to them and the school is n Company time and the scholars o attend; but there is nothing com-y about it. The idea has de-d from the theory that future ives often lie latent in the lower of the factory organization, and fairer, better and cheaper to de-

The School in Action
One section of the 175 workmen listening to a scientific lecture

velop them than train in new men from the outside.

In designing the course of study two objects were considered over and above enlightening the students on their specific work in the factory. Sufficient geography and economics were introduced to give a satisfactory idea of the sources and nature of the raw materials used; and an amount of science, mathematics and economics worked in. These latter topics were utilized as a means of making the scholars think, for a mind trained to grasp the essentials of a problem and study it from an analytical standpoint is useful in any branch of business. Besides that, a little occular demonstration with some improvised apparatus helped to throw a vast amount of light on the physical principles underlying much of the technical procedure in the plant.

That phase of the work which might be directed to bettering the relations between employed and capital has been considered an intangible asset. It is a subject which cannot be computed in cold detailed facts. But if after trying the experiment for six months it is found that men have learned the intelligent use of reference works for compounding facts for or against any argument; have learned to look on the standard encyclopedias as friends instead of fearsome storehouses of dryness and drought; have developed a liking for good wholesome literature; have seen something of the intricacies of commerce and finance and travelled in far distant lands to witness the screen activities of their fellow-men toiling to produce the raw material all about them in the factory; then their outlook on life must be affected.

In detail it might be mentioned that the school in question is held in the factory of the Goodyear Tire and Rubber Company of Canada, Limited, at New Toronto. The idea took definite development about seven months ago when a young chap, who had just graduated from university, was entrusted with the application of the experiment. His chief qualifications were not enclosed in his academic parchment, but involved in the fact that he had knocked about amongst the British Tommies in the mid-Orient during the late war and had seen, first hand, the effect of interesting education applied as a cure to that boresome disease "Fedupitis."

The first intention was to apply the experiment to certain prospects amongst the non-executive element of the factory. Suspicion, lack of interest and perhaps a tinge of ridicule faced any extension in other directions. Within a few weeks, however, this all melted away and topics involving industrial history, evolution of progress and current events were soon keenly attended by those holding responsible positions in the factory system.

It is an astonishing thing the attitude of the working man to anything that smacks of a university. He finds it difficult to separate that word from association with highbrows, snobbery and a class of recluse who have no connection with the ranks of labor excepting when the aforesaid want money. Once the university man will forget all about the balance of trade between a six-hundred-dollar-a-year professor and a ten-dollar-a-day mechanic, and come forward and seek a meeting with the son of toil, he will

make two interesting discoveries. He will find that the ranks of labor are keenly interested in education and he will receive an insight into the boundless storehouse of latent thought and brain energy which could be developed to the untold gain of the nation. A visit to a class when the unrest of to-day is being studied in the light of history would be ample justification for the above statements.

When the main section of the school was started some difficulty was experienced in knowing just where to start regarding the curriculum. A test examination showed that only a small percentage of workmen have retained the smattering of fractions and decimals that they had received at public school; large numbers on the other hand had not attended school for a sufficient time to become familiar with these topics. Here then was a starting point and it threatened to be a long, tedious obstacle until the men demonstrated their willingness and intention of studying systematically at home if a suitable text-book could be provided. The ordinary treatise on the

EXAMINATION PAPER

1. Draw a section of the rubber tree and name the various parts.
2. What is the average percentage of rubber in latex?
3. What is the operating principle of a Bristol recording thermometer? Name at least two advantages it possesses over the ordinary mercury type of thermometer.
4. If a barometer standing at 29 inches was placed in a vacuum chamber and a vacuum of 28 inches created in the chamber; what would be the effect on the barometer? Calculate its probable reading.
5. Rubber grows in a belt 15 degrees north and south of the equator. How wide is this belt in miles?
6. Between what temperature is rubber air dried?

A typical Examination Paper set after three months' study ; 175 men tried the paper. Average marks: 58 per cent.

topic did not meet the requirements. They were replete with examples but famished for information on how to do the examples. The difficulty was overcome by the publication of a special book that was printed on the Company's mimeograph. The order was reversed as the most detailed instructions were included and after a few hours study the men had acquired a first-hand working knowledge of decimals and fractions. Meetings of three or four hours total duration served to clear up any points in doubt and the class was ready to handle problems in percentage, mensuration and proportion that dealt somewhat directly with the routine of the Goodyear Tire factory.

The mathematical book was followed by a publication dealing with the procedure in the factory. This was compounded by experts in the many phases dealt with by the book and was somewhat technical. It was meant to act as a skeleton for a series of lectures. This study had not progressed far when it was found necessary to introduce elementary chemistry and physics to the curriculum, in order that the workmen students might grasp the fundamental principles of applied science in the factory. Before this little course had been completed the men had a splendid idea of the nature of vacuum production and measurement, compressed air, temperature control and recording, a smattering of electricity and the nature of chemical combinations. The technical studies pertaining to the factory were interspersed with a few lectures on economics and finance. Special effort was made to clear the air regarding the period of reconstruction through which Canada is now passing. This gave the men an insight to the money conditions now in existence and broadened their minds on the subject.

Progressive and encouraging, as was the work amongst the workmen of the plant, it did not surpass the interest taken by the foremen and minor executives once the rough edges had been brushed away and the purpose of the work thoroughly understood. The studies for this section of the pay-roll were necessarily varied, and after some experimental work the course was lined up with a view of leading to a study of labor turnover. An effort was made to reconstruct history and drag from its members the dry dust of dates and persons. These were replaced by a snappy discourse of events in their relation one to another, with social evolution as a backbone to work from. To witness a group of forty or fifty busy factory executives listening intently to a talk from a young university graduate, on the evolution of industry; and then hear the intelligent questions that are brought up in the after discussion, is proof positive

EXAMINATION PAPER

1. What is meant by the term "Bullion"?
2. Name three factors which cause a foreign country to set a discount on Canadian money at the present time.
3. If a stock with a par value of $20 a share, and paying 8 per cent., may be purchased at the present time for 60 per cent. of its face value; what rate of interest will an investor receive if he makes a purchase of this stock?
4. Name one common cause of mill rolls breaking.
5. What is mineral rubber, and where is it obtained?
6. What effect has moisture in compounding materials?
7. What is the meaning of the word "Tensile"?
8. Think back over the historical talks that have been given and name three great gifts that have been made to progress and industry by working men.

A paper set after five months' study; t same group of men passed this witl an average mark of 75 per cent.

that some educational institution in C ada is not doing its full duty to the r payers. It is also rather a complim to the organizer of the work, to hav deputation of workmen stop him in passageway of the factory and broach subject of a club, to meet one nigh week, possibly in the Y.M.C.A., in wh the talks could be extended with encroaching on the Company's time.

"When I consider the atmosphere which we started just six months a the director of the work stated, "it as one of the greatest compliments th have had thrown at me."

New Electrical Device

Two bulletins just issued by the Ha Hubbell Company of Canada, Limited, are descriptive of two new devices which they are placing on the market. These are the Toggle Flush Switch and the Toggle Snap Switch. The bulletins are numbered 16-12 and 16-18, and are for insertion in the company's catalogue number 16.

What can be done with a factory school. The examinations were more complex as the studies continued.

The Motor Truck as Solution of Industry's Transportation Problem

By ELTON JOHNSON

[N making a survey of his plant and office, in rder to re-assure himself nat he is using an up-to-ate, efficient and econo-ical system in every de-artment, the manufac-irer of to-day must give very considerable share his attention to his ansportation methods.

Probably no item of the anufacturer's costs is ore neglected and at the me time has such pos-ibilities of scientific or-nization as the hauling his raw materials and ished products. In the erage business to-day, transportation insufficiently organized with the result t operating costs are higher than they ed be.

Every manufacturing concern that es any considerable amount of hauling, ther by railway, steamship, horse and agon, or motor truck, should have a ffic manager who should give at least t of his time to co-ordinating all the sting modes of hauling in use by his mpany, to organizing delivery on the st economical basis and to supervising th purchase and maintenance of the mechanical equipment in use.

or thousands of manufacturers in Canada the motor truck has solved their transportation problems. The development of the use of commercial motor vehicles since the war, in all branches of agriculture and industry, has brought about little short of a revolution in our exting modes of transportation. The ne five years, which will undoubtedly see a stupendous growth in motor truck transportation, will produce radical changes not only in the methods of hauling in use to-day but even in the actual distribution of industry.

In Ontario, to-day, there are over 12,000 motor trucks in use. Nine hundred of these are owned by farmers, while the remaining thousands are operated by business men and manufacturers. In the United States, where the growth of this new agency has been more rapid, there are close on to a million motor trucks in operation. Manufacturers of every conceivable commodity are using trucks for bringing in their raw products, for yard work and for the delivery of their finished products. In most cases, co-ordination is accomplished with railway and steamship, but in some instances, the truck has replaced the railway where delivery distances are less than 100 miles.

Facilitating Lumbering Operations

With the great increase in the use of motor vehicles in all branches of industry, a revolution in transportation methods is taking place. Canadian manufacturers are already seized of the value of the motor truck both as a means of handling raw materials and delivering the finished product, and the number of trucks in commercial use is rapidly increasing. In this article some experiences in the use of trucks are given and suggestions are made as to the services in which they can be used to advantage.

It was the war which taught United States and Canada not only the advisability, but the necessity, of transporting freight by means of motor trucks. During the congestion of the railways in the Republic during 1917 and 1918, the manufacturers turned to the commercial car as a solution. Day and night during the war, powerful trucks carried war needs from camp to camp, and from manufacturing cities to the sea coast.

When peace came, the idea of truck transportation remained and automobile concerns began to turn a great share of their attention to the truck end of their business. To-day there are 215 truck-makers—and they are all hard pressed to fill orders. The growth of this new movement has been so rapid that we scarcely realize to-day that a new era of transportation has already arrived.

The motor truck, in the manufacturing field, is becoming more and more an adjunct to production. In Canada, to-day, it is discharging many functions. Its service begins when a building from which will issue production is being erected. It hauls away the dirt from the excavations, brings in materials for construction, delivers the raw material and finally completes its record by carrying finished articles to the point of delivery.

Canadian manufacturers are using the motor truck in the matter of delivery in two ways—first, as an auxiliary agent to the railroad and steamship, and secondly as a definite replacement of all other methods of hauling.

A study of the results achieved by the motor transportation system in use by Telfer Brothers, Limited, biscuit manufacturers, Toronto, will be useful as an example of what firms may achieve in economy, speed and satisfaction by the use of motor trucks.

This manufacturing concern is operating two trucks, both of two-ton capacity, for round trips between these Ontario cities and towns:— Hamilton (40 miles); Welland (85 miles); St. Catharines (72 miles); Niagara Falls (85 miles); Brantford (65 miles), and Guelph (70 miles). Such has been the success attending the introduction of truck delivery, that plans have been completed to extend the scope of their truck delivery to Port Hope, Belleville, Kingston, Lindsay and Peterborough.

Telfers have found that truck delivery is definitely more economical than freight shipping. They estimate that the cost of shipping 100 pounds of biscuits to their wholesalers in Hamilton and bringing back the empty packages is 76 cents. The cost of making the same shipments by motor trucks is exactly one-half, or

36 cents. This sum includes not only the cost of gasoline, oil and the driver's wages, but also the daily depreciation on trucks and tires, the interest on the investment, insurance and labor used in loading.

In estimating the cost of freight delivery, the actual freight rates must not alone be considered. Besides these, and the delivery charges, both in Hamilton and Toronto, the extra cost of labor and material in securely packing and crating the biscuits and the cost of freighting back the empty packages must be reckoned with.

If speed is a consideration in distribution, there is no question but that the truck can deliver goods to a point 100 miles away more quickly than the freight car, which averages only 30 miles a day to the truck's 100. If speed is no consideration; if the products to be shipped are light and bulky and the delivery distance is considerable, it is equally certain that the freight car is the only sensible carrying agent.

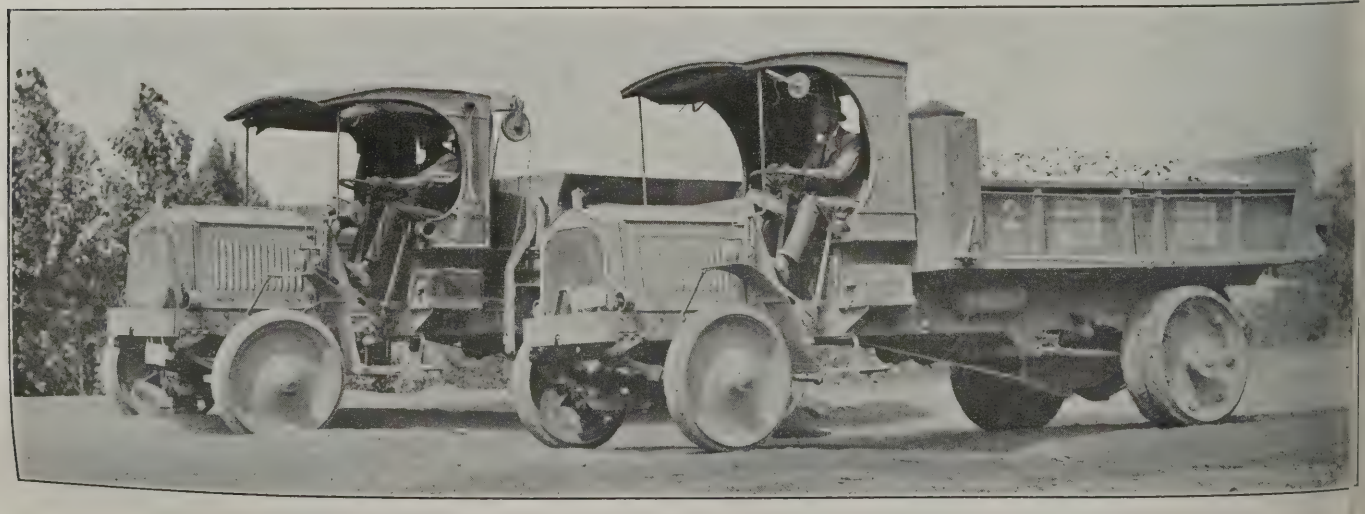
The motor truck is an expense every moment it is on the road, and the manufacturer who decides upon trucks as his delivery agent, must in some way, arrange that his cars bring back return loads. If it is not possible to bring back empty packages or crates, it might be practical to make arrangements with firms in the city of delivery to bring back some of their products or to bring in loads of necessary raw materials.

Three hundred miles has often been taken as the limit for an efficient, economical motor truck route, but the Goodyear Tire and Rubber Company is operating a continuous service between Akron, Ohio, and Boston, a distance of 800 miles. A fleet of motor trucks make the round trip in from 6 to 9 days. Each truck is manned by two drivers, one of whom sleeps while the other drives.

With the present poor condition of roads in Canada, it is only possible for the motor truck to compete with the railroads in delivery distances of less than 100 miles and with less than carload lots. "Compete" is not the right word, however, as the motor truck is merely taking away from the railroad, that shipping which is least profitable. Carrying less than carload lots a distance of less than 100 miles is seldom profitable for the steam line and involves costly congestion at the terminals when the whole facility of the road should be turned in that direction where it will always be supreme, namely, the hauling of full carload lots any considerable distance.

Advocates of highway traffic in Canada are in no sense attempting to organize a system of transportation which will be a rival to the existing systems—the railway and merchant marine. They are aspiring to supplement these existing methods in a transportation trinity which will result in increased production throughout Canada. They are interested in arranging a satisfactory relation between all three traffic factors, assigning to each its proper share of this country's hauling. It is in local communication, not in national, that the highways offer an infinite possibility of development. It is a development which should be of the greatest interest to every Canadian manufacturer to-day from a definite business standpoint.

Trucks are built in such a variety of sizes, weights and designs of body, that there is a truck suitable for the needs of every type of manufacturer. That there are only 12,000 motor trucks in use in Ontario shows that many thousands of manufacturers are not yet using this new agency to any considerable extent.



Glass manufacturers, for example, are using trucks to haul both raw material and finished product. Soap is being hauled in trucks, which, on account of cleverly painted bodies, serve also as excellent advertising mediums. The weight of pianos is not too great for the powerfully-constructed truck, and even machinery weighing several tons is being hauled considerable distances by motor.

The chief factor which is holding back increased development of this new transportation agency is the lack of suitable highways in Canada. The proposed highway system for Ontario and the large appropriations for good roads by both the Federal and Provincial Governments should do much to make highway hauling popular with manufacturers. The ideal type of roadbed to stand the strain of heavy duty trucks has not yet been discovered nor has the proper relation between main highways and auxiliary roads been found. Manufacturers everywhere are among the foremost advocates for good roads.

There is no one more interested in motor truck transportation than the Hon. F. C. Biggs, Minister of Public Works in the Ontario Cabinet. He is a strong believer in the possibilities of great development in this movement and is not forgetting the truck factor in his plan for a widespread good roads system in Ontario. He stated that he realized that many of the main roads in his system must be built to stand the strain of heavy duty trucks, and stated that his engineers were working out the problem of construction now. He declared, moreover, that he didn't know what his department would have done this summer and fall without the help of twenty Government-owned trucks.

Heavy Canadian winters are responsible to some extent for the delay on the part of manufacturers in using truc

Two Trucks Used by a Toronto Firm for Delivering Building Materials

News and Views of the Association

There will be found each month in this department a record of the various activities of the Canadian Manufacturers Association during the preceding month. The information is supplied to INDUSTRIAL CANADA officially, and all members of the Association are urged to acquire the habit of reading and checking over the contents of the department carefully in order to keep themselves posted on the work of the Association

Kitchener and Waterloo Branch Meeting

A GENERAL meeting of the Kitchener and Waterloo Branch of the Association was held in Kitchener on Friday, October 8th, 1920. The meeting was well attended and proved to be very interesting.

The nominating committee selected at the last previous general meeting for the purpose of recommending the personnel of the Executive Committee of the Branch, proposed that it consist of Chairman of the Branch, J. H. Baetz; Vice-Chairman, H. M. Snyder; W. E. Woelfle, T. Valentine, W. H. Moore, G. Schlee, J. A. Martin, A. R. Kaufman, G. H. C. Lang, Geo. S. Ahrens, O. Kinzie, F. S. Hodgins. This report was unanimously approved.

An interesting discussion followed, and in view of the fact that the Committee of the Cabinet enquiring into the effect of the Canadian Customs Tariff upon the general welfare of the country was then on tour, those present thought that the industrial and agricultural growth of the County of Waterloo might be well taken as an excellent illustration of the beneficent result of a sound national fiscal policy, and it is quite probable that an interesting story may be developed.

Ontario Power Committee Seeks Information

AT a meeting of the Power Committee of the Ontario Division held on October 25th, attention was drawn to the recent request of the Ontario Hydro-Electric Power Commission to users of power to reduce their consumption by 25 per cent. The secretary was instructed to ascertain from the membership whether such restrictions could be effected without serious inconvenience. Accordingly a circular was issued asking for specific information as to the number of h. p. contracted for, the number of h. p. actually delivered and any experience of shortage of power that members might have had. To enable the committee to act, an intelligent understanding of the present situation was necessary, and members were urged to be good enough to answer the questions as fully as possible so that the committee might be fortified by the facts.

Tariff Committee Discussed Tariff Inquiry

A MEETING of the Tariff Committee was held at the head office on October 22, with G. W. Watts, Canadian General Electric Co., Limited, in the chair. The principal business before the committee was the receipt of a report from the manager of the Tariff Department on the hearings of the Tariff Commission in Western Canada. These hearings had been attended by the manager and in his report he summed up results to the present time. The committee also spent some time in discussing the new ruling regarding the valuing of imports in the currency of the country of export. Both matters were made the subject of a report to the Executive Council at its meetings in Montreal.

Legislation Committee Holds Its First Meeting

ON October 22, the Legislation Committee held its first regular meeting for the year, 1920-21, at the head office. C. J. McFarlane, Canadian General Electric Co., Limited, Toronto, the chairman, presided. The first item of business was the addition of new members in order to make the committee as widely representative as possible of the membership of the Association. It was decided to ask the divisional secretaries to make nominations in their respective divisions so that there would be representatives on the committee from each capital city in Canada. Meanwhile a number of new members were added. (See page 138).

The Board of Commerce case was discussed at some length and it was decided to empower the Legal Department to employ such counsel as they deemed necessary to present the argument of the Association before the Privy Council. It was felt that there was no ground for any further declaration of policy at the present time.

It was reported to the committee that the appeal in the company test cases would be heard at the November sittings of the Privy Council in London. The Association is not directly interested in the case, it being carried on by a group of federally incorporated companies for whom F. W. Wegenast is acting as counsel. However the outcome will be watched with interest.

A report was presented to the committee reviewing the progress of minimum wage legislation in the various provinces and bringing information down to date.

Activities of the Montreal Branch in October

THE Dominion Executive Council held its monthly meeting in Montreal on Thursday, October 28th. This was much appreciated, for it makes the members of the Division feel that they are more or less on the Association map when the Dominion Council itinerary brings the meeting to this city. Quebec City is looking forward to a meeting in the near future.

Mr. Louis Loranger, the recently appointed travelling secretary for the Quebec Division, has been carrying the Association gospel into the cities of Quebec and Three Rivers since he took up the work and has been very successful in securing new members.

The Montreal Branch is busily engaged in preparing its case for presentation to the Railway Commission when it meets here on November 10th to hear local evidence touching upon the application of the Bell Telephone Company for the adoption of the measured service system. Messrs. F. W. Stewart, the chairman of the branch; B. W. Coghlin, vice-chairman, and Michael Hirsch have been named a committee to prepare a brief of the Branch and considerable specific evidence has been gathered in this matter for presentation.

The Montreal Branch is lending its support to other commercial organizations in the city in an effort to secure the assistance of the Federal Government in the construction of a second bridge from the Island of Montreal to the South Shore. The outlook is at the present time that this effort will bear fruit as the city is now presenting a united front in the matter.

The quarterly dinner of the branch will be held on November 16th. For this occasion two speakers have been secured, Roger W. Babson of Babson's Statistical Organizations of New York and J. N. Barss of the Shawbridge Boys' Farm and Training School. Mr Babson, who has addressed the branch on a former occasion, will speak on "The Outlook For 1921," and Mr. Barss will address the branch on "The Stuff of Which Men Are Made." A special effort will be made to secure a bumper attendance at this meeting. —R. W. Gould.

Another Section Formed on the Coast

NEWS has been received from the Secretary of the British Columbia Division which may be taken as an indication of the ever-growing appreciation of the services and facilities which the Association is providing for manufacturers of that province.

The brick and tile manufacturers have formed themselves into a Clay Products Manufacturers Section, such section to consist of those manufacturers engaged in this industry in the Vancouver Island district. By thus getting together and considering non-competitive problems of common interest to them all, we predict that much good wil result to the clay products industry in the Vancouver Island district.

Manufacturers Give Fifty-Three Scholarships

AT a meeting of the Education Committee of the Toronto Branch, C.M.A., of which George Brigden, Brigdens Limited, is chairman, it was reported that, for the session of 1920-21, fifty-three scholarships of $25 each were being donated to the Central Technical School by the manufacturers of Toronto. This is the largest total in the history of the scheme and shows how keenly alive the manufacturers are to the importance of encouraging technical education. The C.M.A. scholarships are awarded by competitive examination and give the student a three-year industrial course at the school. This year for the first time two students have decided to take the course in optometry.

Trade Commissioner Speaks on Industries Fair

CAPTAIN EVAN J. EDWARDS, H. M. Senior Trade Commissioner for Canada and Newfoundland, left Montreal recently for a tour of the West, during which he will address boards of trade and other interested bodies on the subject of the British Industries Fair. Starting at Winnipeg, Captain Edwards was scheduled to speak at Regina, Saskatoon, Edmonton, Calgary, Victoria and Vancouver. After his return to Montreal, he wil speak before a number of trade bodies in Eastern Canada.

As already noted in INDUSTRIAL CANADA the British Industries Fair will be held in London and Birmingham from February 21 to March 4, 1921, and in Glasgow the week following. Though held in different cities, it is all one Fair and is so arranged that any one may take in all three. In some cases this is necessary as in no instance are the same goods exhibited at two of the Fairs. For the most part, however, care is taken to see that industries are so grouped that travelling will not be necessary.

Some Recent Visitors to Association Office

SEVERAL interesting visitors have recently called at the head office of the Association in search of information and advice. Officials of the Commercial Intelligence Department have received them and done all in their power to assist them in obtaining their object. From the register of the Department, the following names are taken as indicating the widespread nature of the services rendered.

G. J. M. Simons, foreign editor of the *Telegraaf*, *Courant* and *Maandag Ochtenblad* of Amsterdam, Holland, called in the interests of Holland's International Industries. Fair to be held in Utrecht, September 6 to 16, 1921. Mr. Simons hopes to see a number of Canadian manufacturers interested in the Fair, for it will be open to all foreign manufacturers and their products. He will keep the Commercial Intelligence Department posted on developments.

G. V. M. Heriot, of Heriot Bros., Buenos Aires, Argentina, import and export agents, wanted information as to Canadian manufacturers who would be interested in selling their goods in the Argentine. He reports a strong desire on the part of people in his country t get Canadian goods, purchases hither having been largely confined to Gre Britain and the United States. M Heriot left a subscription for INDUSTRIA CANADA and the *Canadian Trade Inde* as an indication of his interest.

Wm. A. Cloutman, an Englishman wh has lived for eleven years in Chile, visite the office recently in company with T. Douglas, Amherst, N.S. Messrs. Clou man and Douglas have formed the Trad of Canada, Limited, with the object promoting trade between Canada a Chile. Mr. Cloutman says that very litt Canadian goods are at present being i ported into Chile, but he has hopes developing business between the t countries.

R. J. Laird, Laird Agency Co., mach ery merchants and agents, Auckla N.Z., came with a letter of introduct from the Canadian Trade Commissio in New Zealand. The Department able to put him in touch with seve manufacturers in whose products he interested.

J. Menzies, West Indian Age Georgetown, British Guiana, wanted nections with flour mills, hosiery, un wear and wall paper manufacturers was furnished with lists.

Arthur M. Holmes, Wellington, N was particularly interested in pa goods and was placed in touch manufacturers of these lines.

Richard Whichello, of R. Whichell Co., Rio de Janeiro, Brazil, was loo for connections with machinery m facturers.

Guillermo E. Rohda, Rohda & Guayaquil, Ecuador, a chocolate pla visited Canada in order to find a ma for chocolate. He had previously so Great Britain but was feeling ou larger markets. He was put in t with Canadian chocolate manufactu

Alberta Manufacturers and Factories Act

APPEARING before the Commit Inquiry appointed by the Go ment of Alberta to inquire into the ing of the Factories Act, C. A. chairman of the Medicine Hat Br C.M.A., presented the following m andum on behalf of the manufactur the province:—

The manufacturers of Alberta wi the first place, to call attention t fact that two national conferences been held at Ottawa dealing with legislation at which a number of

mendations were made which were concurred in unanimously by workers, employers and representatives of the Provincial Governments, and wish to also call attention to the fact that one International Labor Conference has been held in which Canada participated at which unanimous recommendations for labor legislation were made.

The outstanding conclusion arrived at by all these conferences was that labor legislation in different countries as well as in the different provinces of any particular country should conform to certain well recognized international standards, and that a general uniformity should be aimed at in the main provisions.

Uniform Legislation.

The Canadian National Conferences have both been unanimous in recommending that all the provinces of Canada proceed along similar lines and enact uniform legislation. The reasons for this are very apparent. Fair conditions cannot be different in different provinces in connection with the same industries, and the industries in one province are subject to direct competition by the industries in another province, with the result that any province that seeks to embody restrictions which are not imposed in competing provinces, works a great hardship not only on the manufacturers of the province but on the workers as well by driving work, which would otherwise be done in that province, to other provinces.

Best Practice Sought.

Labor Legislation should not as a rule embody special features which have not commended themselves as the best practice to workers' associations and employers' associations as a whole, and, particularly in a province like Alberta, where industry is very gradually coming to its own, employers should not be subject to restrictions which are not even asked for by organized workers in other provinces and other countries.

We append to this memo the recommendations passed at the three labor conferences, which we have referred to, and we urge that the features of the Alberta legislation which are novel and experimental be eliminated and the legislation be made to conform to the best standards adopted by the leading employers' and workers' associations of Canada.

We wish to call attention to the following special respects in which Alberta legislation has been prejudicial to the interests of both employers and workers in Alberta in so far as it has been enforced and to also point out certain legislative enactments which have been found to be unworkable.

Minimum Wage Legislation.

No province, except Alberta, has attempted to establish minimum wage legislation for adult male workers.

As a comprehensive treatment of this subject has not yet been worked out in any country, and there is no demand in Canada, so far as we are aware, for minimum wage legislation for male workers, and while at the present time no harm results from the minimum fixed in Section 24, of the Alberta Factories Act, we wish to point out that this is a subject which should not be dealt with in connection with the Factories Act legislation, but should be reserved for separate treatment after national conferences shall have determined upon the most feasible procedure.

Women's Wages.

Sections 24 to 27, together with Section 26A of the Act as amended in 1919, deal with minimum wages for women and the conditions under which women may be employed. The two national labor conferences, above mentioned, have unanimously recommended that the conditions under which women work, including minimum wages, should be determined by minimum wage boards, upon which both the employers and the workers have equal representation. The board should have power to make special regulations to meet special conditions which exist in each locality, and all regulations before having the force of law should receive the approval of the Lieutenant-Governor-in-Council.

The best legislative practice is embodied in the Manitoba Minimum Wage Act, which almost immediately after its passage was enacted by the Province of Saskatchewan, and which at the last session of the Ontario Legislature was adopted by that province. All the orders made in Manitoba have been concurred in unanimously by both employers and workers and the act has given general satisfaction. As conditions change the regulations can be speedily changed to conform to the new conditions and the Board itself, by means of its inspectors, exercises a constant supervision over the well-being of the worker.

We are of the opinion that Section 26A as enacted in 1919, by which the chief inspector in any town or city, upon the recommendation of the local advisory committee, may make regulations, while in general harmony with the principle of the act recommended by the national conferences, should be amplified in order to give to the local boards full power, and that all regulations should be subject to the approval of the Lieutenant-Governor-in-Council.

We are inclined to think that a number of independent advisory committees in the different cities and towns in the province will not secure as satisfactory results as would be secured if one board were charged with the matter, so that the regulations as far as possible may be uniform throughout the provinces so far as conditions warrant.

Hours of Labor.

The provisions embodied in the Alberta Act, Sections 24 to 27, regarding shifts, places a hardship on Alberta manufacturers. The whole subject of working hours and night work was discussed at the International Conference at Washington, and recommendations have been made on the subject by the League of Nations which have been received by the Dominion Government from the International Labor Office, and we understand have been presented by the Dominion Government to the various provincial governments in order that, as far as possible, uniform and fair legislation, limiting hours of labor, may prevail throughout Canada.

In the material attached to this brief will be found the international recommendations on this subject and we urge that the unusual provisions as to day and night shifts now in force in Alberta be repealed and that legislation in harmony with the international recommendations be enacted to take their place.

The principal difficulty under the present Alberta law arises from the fact that a worker who has been engaged on a day shift, even for a few hours, cannot be employed on the following night shift. This unusual provision fails entirely to secure the purpose for which it was apparently intended, of making certain that no worker should work more than a certain number of hours per day. The whole matter has been dealt with in great detail by the International Labor Conference, and we wish to urge that the Alberta legislation be made to conform with that which the other provinces may, after conference, decide to adopt in order to carry out Canada's obligation as a member of the League of Nations.

Employment of Children.

The Alberta Act contains a number of novel enactments in this regard which are out of harmony with those contained in the Ontario Act. At this point we wish to refer to the attached memo, and also to refer to the recommendations of the International Labor Conference referred to above and also attached.

In this connection it is important that a uniform practice regarding conditions and ages at which young persons are to be allowed to work should prevail throughout Canada.

Respectfully submitted.

Ages of Children.

The Alberta Act summarily enacts (S. 24) that "No child shall be employed in any factory, shop, office or office building," "child" being defined as "a person under the age of fifteen years." In all the other provinces the age limit is fourteen years, except that in Manitoba and British Columbia the limit for girls is fifteen years.

In Ontario, Nova Scotia and British Columbia there is a relaxation of the age limit in certain occupations such as canning and under certain conditions. In Ontario a second age minimum of twelve years is fixed for these cases, but in Nova Scotia and British Columbia there is no such second minimum. In Ontario the relaxation extends, subject to certain conditions, to shops.

Distinction Made.

The acts of all the provinces except Alberta make a distinction between a "child" (i.e. a child under fourteen) and an intermediate class of "young girls" up to eighteen years of age. This intermediate class includes in Ontario "youths" from fourteen to sixteen, in Manitoba "boys" from fourteen to seventeen, and in Saskatchewan "youths" from fourteen to sixteen. Special restrictions are imposed upon the employment of persons of this intermediate class. In the Alberta Act this class of persons is treated either under the head of children and prohibited from working or under the same rule as adult male employees. In the Alberta Act on the other hand many of these special provisions are made applicable to all workmen. The practical effect of these provisions is to prevent the employment in any factory, shop, office or office building, of any boy or girl less than fifteen years of age for any purpose whatever.

Age Arbitrarily Raised.

Thus, for instance, the age limit in the definition of "child" is arbitrarily raised from fourteen to fifteen years. The carefully worked out provisions of the Ontario Act distinguishing between "child" and "young girl" and "youth" are wiped out as well as the elastic provisions for the employment of children between twelve and fourteen years of age at certain seasons of the year in the picking and preparation of fruit and vegetables. Further, the provisions specially introduced for the protection of children and young girls under the Ontario Act are worked over into provisions applicable to all workmen in the Alberta Act. Thus the provisions respecting hours of employment, which in the Ontario Act are applicable only to children, youths, young girls and women are in the revised form in the Alberta Act made applicable to employees generally. The provision for keeping a register for children, youths and young girls in the Ontario Act appears in the Alberta Act as a provision for the registration of all employees. The provisions of Section 12 of the Alberta Act were in the Ontario Act applicable only to the employers of children, youths and young girls. Subsection 2 of Section 26 was in the Ontario Act applicable only to children, youths, young girls and women and the same applies to Subsection 3.

At Edmonton.

When the Commission sat at Edmonton C. G. Robson, chairman Edmonton Branch C.M.A., presented the following memorandum along somewhat similar lines:—

The manufacturers of Edmonton appreciate very kindly this opportunity the Government has given them of expressing their views on labor legislation before this Commission and wish you to convey to them our sincere thanks for the privilege.

Two national conferences have been held at Ottawa on labor legislation, at which a number of recommendations were made and concurred in unanimously by representatives of both employees and employers as well as by representatives of provincial governments. One international conference has also been held at Washington, in which Canada participated at which unanimous recommendations for labor legislation were adopted.

The outstanding conclusion arrived at by all those conferences was that labor legislation in different countries as well as in the different provinces of any particular country should conform to certain well recognized international standards and that a general uniformity should be arrived at in the main provisions.

The Canadian National Conferences have been unanimous in recommending that all provinces of Canada should proceed along similar lines and enact uniform legislation. The reasons for this are very apparent. Fair conditions cannot be different in different provinces in connection with the same industries, and the industries in one province are subject to direct competition by the industries in another province, with the result that any province that seeks to embody restrictions that are not imposed in competing provinces works a great hardship not only on the manufacturers of that province but on the workers as well by driving work which would otherwise be done in that province to other provinces.

When the manufacturers of Alberta waited on our worthy Premier and his cabinet last spring and urged that no greater burden be placed on Alberta manufacturers than that existed in other provinces with whom we are in competition, he expressed himself in favor of uniform legislation in the different provinces.

Not be Restricted.

Labor legislation should not as a rule embody special features which have not commended themselves as the best practice to workers' associations and employers' associations as a whole, and, particularly in a province like Alberta, where industry is very gradually coming into its own, employers should not be subject to restrictions which are not even asked for by organized workers in other provinces and countries.

We wish to call attention to the following special reports in which Alberta legislation has been prejudicial to the interests of both employers and workers in Alberta in so far as it has been enforced, and to also point out certain legislation enactments which have been found to be unworkable:

Minimum Wages.

1. No province except Alberta has attempted to establish minimum wage legislation for adult male workers. While no harm has resulted from the minimum fixed in Section 24-2 of The Alberta Factories Act, it is submitted that this is a subject that should not be dealt with in conection with Factories Act legislation but should be reserved for separate treatment after national conferences shall have determined upon the best possible procedure.

2. The provisions embodied in the Alberta Factories Act, Sections 24 to 27 regarding shifts, places a hardship on Alberta manufacturers. The whole subject of working hours and night work was discussed at the International Conference at Washington and recommendations have been made on the subject by the League of Nations which have been received by the Dominion Government from the International Labor Office. We understand copies have been presented by the Dominion Government to the various provincial governments in order that as far as possible uniform and fair legislation limiting hours of labor may prevail throughout Canada. We urge

iat the unusual provisions as to day nd night shifts now in force in Alberta e repealed and that legislation in harmony with international recommendaions be enacted to take their place.

3. Section 2-b. A child is defined as person under fifteen years of age. In he other provinces, with two exceptions, child is defined as a person under ourteen years of age. Manitoba and British Columbia set the age limit for irls at fifteen. The aim of the League f Nations is to reach Canada's standard f fourteen years.

Employment of Children.

4. Other provinces make provisions or the employment of children under ertain restrictions; Alberta excludes hem entirely. Section 24 (no child hall be employed in any shop, factory, ffice or office building).

5. In Section 26-a Alberta Factories ct, power is given to determine the mount that shall be paid to any person nder the age of eighteen. The other rovinces have not set a scale of wages or youths, it being generally conceded iat they can look after themselves.

6. Section 24-2. In other provinces iat deal with minimum wages and ours of labor for females there is no atutory enactment as to the amount of ages, the hours of labor or the numer of apprentices, these three matters ing left to the discretion of a minium wage board in each province.

Minimum Wage Boards.

7. The two national labor conferences ive unanimously agreed that hours of bor and minimum wages for women ould be determined by minimum wage ards at which employees and employe should have equal representation. Sch boards have been set up in Manitoa, Saskatchewan, Ontario and British Columbia. In our opinion the best legislative practice is embodied in the Manitoa Minimum Wage Act, which almost immediately after its passage was enacted by Saskatchewan and which at the la session of the Ontario Legislature w adopted by that province. The Bard is composed of five members, and asit has to deal with minimum wages ar hours of labor for female workers on one of the two representatives appointed by each employer and employee mit be a lady. The chairman must be disinterested and not directly or indirectly connected with employees or employers. All the orders made in Manitoba have been concurred in unanimously by both employers and employees and the Act has given general satisfaction. As conditions change the regulations can be speedily changed to conform to the new conditions. This is a very important feature. The Board itself by means of the inspectors exercise a constant supervision over the wellbeing of the workers.

We cannot urge too strongly the necessity of uniform labor legislation and a uniformity of its application in all the provinces. We believe it is to the best interests of workers and employers that this great province of Alberta should be developed to its fullest extent. This cannot be done if legislation is placed on the statute books which places a greater burden on Alberta manufacturers than exists in other provinces. Both employers and employees will suffer as a result.

In conclusion, it appears as if constitutional government is being impinged by Orders in Council in many of the provinces, Alberta included, as well as in the Dominion as a whole. This method of legislation is being freely criticized on the hustings and in the press at the present time. If the Orders-in-Council are to meet with popular approval care will have to be taken to see that they are wholly in the interest of both employer and employee as their interests are so co-ordinated that injury to one will work injury to the other.

Respectfully submitted.

Tariff Department Bulletin

Important Announcements Regarding Tariff Matters, Including Details of Excise Tax Licenses

Board of Customs Decisions.

Tissue paper, per sample, for making newspaper mats, declared to be dutiable under tariff item 147, at the rate of 25 per cent.

"Autoshaver" and "No. 5 Steam-Heated Pneumatic Matrix Drying Press" declared to be entitled to entry under tariff item 441 as free of duty. (In effect from 12th October, 1917).

Departmental Rulings.

Canfield and Taco governors, canopies, fenders, mud guards and road bands, made by independent concerns for use on the Fordson tractor, and not being parts of the tractor as produced by the manufacturers, are not entitled to entry as "repairs" under the Order-in-Council set forth in Memo. 2280-B.

Typewriters brought in by bona fide tourists, resident in Canada for summer months, may be admitted as tourist's outfit under Form E 29. This does not apply to typewriters brought in by commercial travellers or others for business purposes.

Customs Valuation of Depreciated Currency.

In the October issue of INDUSTRIAL CANADA reference was made to the recent rulings of the Department of Customs in respect of foreign currencies and the valuation of same for duty purposes.

The Tariff Department has issued a Circular Letter (No. 277), which has been sent to all members of the Association, dealing with the question. The Circular contains an explanation of the Customs requirements in the matter of foreign paper currencies which have a depreciated value and how the depreciation is to be determined for Customs purposes.

Excise Tax Licenses

The Department of Customs and Inland Revenue state that licenses are obligatory. November 15th, fixed as time limit within which time licenses must be obtained. Act provides penalty for neglect or refusal to take out the required license.

Reference was made in the last issue of INDUSTRIAL CANADA to this question of licenses; and the various classes of licenses and by whom the same must be obtained was therein set forth. A circular letter was sent to all members of the Association by the Tariff Department during the latter part of October, drawing attention to the necessity for obtaining licenses prior to the 15th November. As the matter is important we mention hereunder the two classes of licenses in which manufacturers are chiefly interested:—

Sales Tax License,—to be taken out by every manufacturer, wholesaler, and jobber who sells articles subject to the sales tax. Annual fee, $5.00.

Manufacturers' License,—to be taken out by persons, firms or corporations manufacturing the following commodities for sale, viz.:—Chewing gum, boats, canoes, yachts, motor boats, cameras, confectionery classed as candy or a substitute for candy, firearms, shells, cartridges, pianos, organs, mechanical player pianos, phonographs, talking machines, music boxes, records, musical instruments, chandeliers, gas and electric light wall brackets and fixtures, automobiles, playing cards, wines and other spirituous liquors.

Note:—This Manufacturer's License is not required unless his factory products are subject to the so-called "Excise Manufacturing Tax." For example, cameras are only subject to an Excise Manufacturing Tax when weighing one hundred pounds or under. Thus, if there were a manufacturer who only made cameras of a weight greater than 100 pounds, he would not be required to take out a "Manufacturer's License." It is suggested that persons or firms manufacturing these commodities for sale, should carefully examine the provisions of Subsection 4, Section 19-BB of the Act in order to determine whether or not they should take out this manufacturer's license. The provisions of this subsection will be found on pages 18 and 19 of Excise Tax Pamphlet (Association's Circular No. 266). The annual fee for this license is $2.00.

NOTE:—This license should not be confused with the Sales Tax License. Manufacturers who are required to take out a *Manufacturers* License will also be required to take out a *Sales Tax* License, as the two taxes are entirely separate and distinct from one another.

Notice to Exporters to United Kingdom.

New regulations respecting preferential duties on commodities containing sugar and raw cocoa exported from Canada to United Kingdom.

The Customs authorities of the United Kingdom have issued a revised notice for the information of importers in Great Britain and of exporters in British Overseas Dominions in regard to the British Preferential Tariff.

There has been no change in respect of the Certificates of Origin heretofore approved but an additional form of certificate is now required where the dutiable article in respect of which preference is claimed is an ingredient only of a complete composite article which is liable to duty only by reason of containing the dutiable ingredient.

For example, manufactured cocoa powder is chargeable to duty in respect of the raw cocoa it contains and the new form of certificate should be made by the manufacturer, supported by the previously approved form of certificate given by the grower, producer or supplier of the raw cocoa.

Chocolate confectionery is chargeable in respect of the raw cocoa and the refined sugar it contains and the new form of certificate should be given by the chocolate maker, supported by the previously approved forms of certificates given by the grower, producer or supplier of the raw cocoa and by the sugar refiner.

Jam and condensed milk (sweetened) are chargeable by reference to the sugar they contain and the new form of certificate should be given by the manufacturer supported by the previously approved form of certificate by the sugar refiner.

Information as to the regulations and the approved forms of certificates of origin may be obtained from the Tariff Department of the Association.

Reply to the Arguments Advanced for Reduction of the Tariff

(*Continued from page* 75.)

The total value of the foodstuffs mentioned above, and imported in 1919, amounted to $84,313,672, and the duty collected was $17,952,394. This amount of revenue would, of course, be lost to the Dominion Government if these foodstuffs were placed on the free list. Moreover, the producers of Canadian goods, with which such imports compete, would lose the tariff protection they now have.

The fifth demand is as follows:

(e) "That agricultural implements, farm and household machinery, vehicles, fertilizers, coal, lumber, cement, gasoline, illuminating fuel and lubricating oils be placed on the free list, and that all raw materials and machinery used in their manufacture also be placed on the free list."

This is the fifth step advocated by the Canadian Council of Agriculture's platform in the direction of free trade. The values of imports of the finished goods enumerated, and the duty collected during the year 1919, follow:

	Value.	Duty.
Farm implements and machinery	$8,044,000	$1,572,885
Vehicles	28,848,864	6,321,569
Fertilizers	984,808	98,473
Coal, bituminous	44,411,207	7,595,032
Lumber	140,439	32,466
Cement	26,437	2,667
Petroleum, illuminating fuel, etc.	8,824,894	1,366,767
Total	$91,280,649	$16,989,853

In addition, the clause calls for the removal of the duty now collected on imported raw materials, and machinery for the production of the above goods.

Owing to the indefinite wording of the first demand, it is impossible to estimate what its effect, if put into operation, would produce on the Federal revenue. The same is true of the third demand. But, considering only the second, fourth and fifth demands, except the latter part of the fifth, we find that these demands, which are only part of the general demands for tariff reduction, taking 1919 as a basis, would have caused losses of Federal revenue as follows:

Clauses.	Loss of revenue resulting.
Clause "B"	$11,164,989
" "C"	17,952,394
" "E"	16,898,853
Total	$46,107,236

If the pre-war figures for 1913 are admitted in clause "B"—amounting to $27,158,162, instead of $11,164,989—the total loss of revenue caused by putting these demands into operation would have been $62,100,409.

And again, it is pointed out that this loss of revenue does not include clauses "A", "C" and the latter part of "E" which together might easily double the loss. Consequently, if all the tariff proposals set forth officially by the platform of the Canadian Council of Agriculture are put into operation, there will not be much left of the Canadian Customs Tariff, or of the revenue now collected by it, and Canada will be very close to free trade.

It is fitting to point out that the Canadian Council of Agriculture proposes to reduce in this drastic manner a tariff which now imposes an average rate of duty on dutiable imports that is actually lower than the average rate in the year before the National Policy tariff became operative. The Canadian average rate of duty on dutiable imports has been much lower than the average rate for the United States up to the year before the war. The Underwood tariff made a very considerable reduction, but for 191 the United States average rate was still 21.3 per cent., or only slightly below th Canadian average.

In conclusion, we beg to repeat agai the closing paragraph of the genera statement of the Canadian Manufactu ers Association submitted at the firs hearing in Winnipeg:

"In the course of this statement a effort has been made to show that man facturing in Canada is inseparably co nected with other industries; that tw million wage-earners and dependen secure their living through manufactu ing, and that the most of the remaind of the population derive indirect benefit that this country as a whole has ma remarkable progress under the Nation Policy of protection; that, with the enti world swinging towards protection, Ca ada cannot relinquish it; that the vision of the tariff should be scienti and take into consideration the requi ments of all classes, that a stable fis policy of protection with some assura of permanence is of vital need; a finally, that the aim of the fiscal poli determined as a result of this tariff quiry, should be to advance Canada wards her destiny as a fully develo nation with the British Empire."

BONUS SYSTEMS

Many manufacturers want to start one. They don't know how simple or easy it is—and how far-reaching. Why not put the problem up to us? We know how.

"Time" is the only sound foundation for a successful bonus system. Time Recorders give you a printed statement of the worker's time—a statement made by the worker himself.

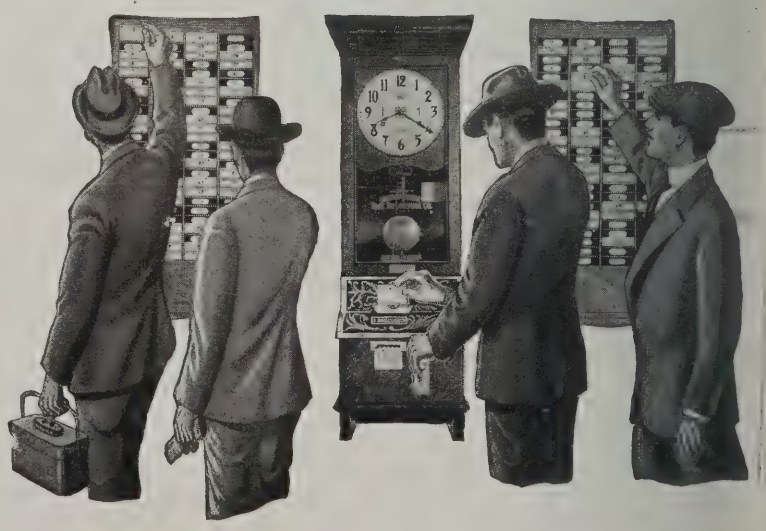
Bonus systems give you increased output—increased efficiency---improved plant morale—and give you them in a surprisingly simple way.

You can cut down the murderous daily total of lost working minutes that so often run into the hundreds of thousands every week.

Let us tell you how.

International Time Recorders

Are being used to run many beneficial Bonus Systems—in doing this they are:



Getting increased output at new low costs;

Getting full value from peak power loads;

Keeping down general overhead;

Making everybody happy

Write us for fuller particulars of an Up-to-date Bonus System

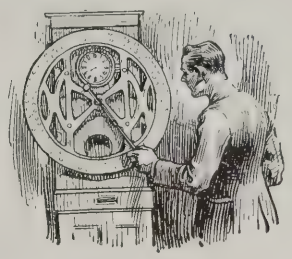
DISCIPLINE!

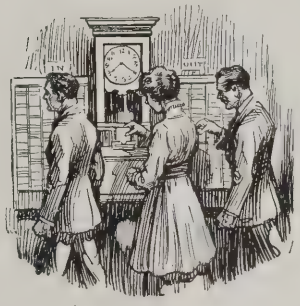
Increased output, coupled with genuine contentment, are two of the many benefits resulting from plant DISCIPLINE

Discipline implies a sense of punctuality, of responsibility, of order, of clean-cut willingness to do with all one's might whatever one's hand finds to do.



Probably the most elementary and most important of these factors in the creation of discipline is PUNCTUALITY. Getting the employee to the plant — nay, right to the bench or lathe (ON TIME), and having him leave on time—not before—not after.

There are many advantages from the standpoint of a cashier and cost keeper's, from the use of



International Time Recorders

but the broadest and most beneficial is the constant four-times-a-day stressing of the value of PUNCTUALITY.

We make Time Recorders for any business. We will gladly advise you of the Time Recording equipment best suited for your business, without committing you to buy.

Synopsis of Proceedings Before the Tariff Commission

(*Continued from page* 67).

Edward Parnell, on behalf of the Prairie Division, C.M.A., read a statement on the incidence of the income tax.

Josiah Bennett, Pine Creek, told how the tariff, in his opinion, hit the man with the large family.

J. R. K. Bristol, on behalf of the Canadian Manufacturers Association, dealt with a number of points that had been raised against protection.

W. D. Bayley, M.L.A., for Assiniboia, presented a socialistic argument against tariffs of any kind.

FORT WILLIAM.

October 16.—Colonel Ray, representing the Board of Trade of Port Arthur, asked that Mr. J. E. Marks, secretary of the Board, be permitted to read a brief dealing with the iron and steel industry of Canada. This led up to a resolution of the Board asking for a bounty on all Canadian iron ores mined and marketed.

R. J. Manion, M.P., spoke in support of the development of natural resources. J. J. O'Connor, on behalf of private owners of ore lands, presented a memorandum of iron *re* mining and how an adequately developed iron and steel industry was essential to industrial independence in Canada.

G. R. Duncan, president, on behalf of the Fort William Board of Trade, dealt also with the iron question.

M. Francis, on behalf of the Port Arthur Board of Trade, dealt with the industrial development of Port Arthur and supported adequate protection.

A. E. Cole, barrister-at-law, Port Arthur, purporting to speak for the general public and disclaiming any intention of speaking other than from a purely unselfish standpoint, launched into a vigorous attack on protection.

SAULT STE MARIE.

October 18.—John A. Hussey, president of the Sault Ste. Marie Board of Trade, presented facts relating to the development of low grade iron ore deposits in Canada and asked for a bounty.

G. S. Cowie, Secretary Mines Department, Algoma Steel Corporation, answered a number of questions relative to the development of iron ore.

W. C. Franz, president Algoma Steel Corporation, told of the business of the corporation.

J. H. Haining gave the viewpoint of the Independent Labor Party, which was the gradual elimination of all import duties on necessaries. J. J. Brothers, another labor man, thought there should be protection in some instances.

The Motor Truck as Solution of Transportation Problem

(*Continued from page* 82).

as haulage agents. The laying of suitable roads will eliminate the winter hold-up problem to a considerable extent.

The factors upon which depend an economical transportation system for any manufacturing concern are many. The first is the agent to be used—whether railway, steamship, horse and wagon or truck. The location of the plant, the commodity to be shipped, the quantities at each shipment and the distance to the receiving point will decide this question. When motor trucks are used, the actual layout of the yards and the efficient working of the actual loading system are important items if economy is to be obtained. Standardized motor equipment if parts are to be easily exchangeable is an absolute necessity.

Care taken in the directing of truck movements will pay big dividends. The truck must not waste time getting to its destination, and there must be no overlapping if a fleet of motor trucks is operated. The zone system of delivery is seldom economical, as a truck should never leave the yards without a full load. The return load ensures payment for the return trip. Truck drivers, moreover, should be chosen with as much care and taught with as much precision, as locomotive engineers. Daily supervision of equipment is essential to economical maintenance. Ten years is not an outside figure for the life of a well-constructed truck, provided care is always used in maintaining it at a high rate of efficiency.

With the advent of motor truck hauling, a manufacturer may now for the first time learn his actual transportation costs. By using an efficient cost system, a manufacturer may be able to find out every detail of his delivery costs and put his finger on the point where waste is lessening his profits.

After a century of neglect, the highways of Canada are coming back into their own. Freight is being moved by road, not in the small wagons hauled by slow-moving horses, but in great, powerful motor trucks. Highway, waterway and railway, are being linked together in a transportation trinity which is solving successfully Canada's transportation problems.

A Canadian Sales Service

Sales Corporation Establishes Important Office in New York

The Canadian Manufacturers Sales Corporation have just taken up quarters in the Bush Terminal Sales Building, New York. Mr. Bush's idea of co-operation in distribution, which was his basic idea in establishing this sales building is carried out by this corporation in their praiseworthy effort of cutting down the trade balance against Canada, in favor of the United States.

This balance as it at present stands is that Canada is only selling $500,000,00 worth of goods to the United States while the United States is selling t Canada, $881,000,000.

To aid in cutting down this trad balance, the Canadian Manufacture Sales Corporation are giving three di tinct services to Canadian manufacture and exporters that they have never ha before: The first is a display of the goods in this Sales Building. The secon the services of a highly organized Sal Department. The third, the financing the sales made by them under t guarantee of L. F. Dommerich & Co.

The financing of the sales is arrang by submitting the customer's name L. F. Dommerich & Company. If he is satisfactory credit risk, they will se to the client's home bank an undert ing from L. F. Dommerich & Compa that the amount the bank advances h on the value of his invoice, on his p ducing a bill-of-lading, will, even if t buyer of the goods should fail, be p into the bank's branch in New York a given date by L. F. Dommerich & Co pany.

The Bush Sales Building welcom this new corporation to their bu ing, as they feel sure that such s vices as they are giving will soon be o responded to by Canadian manufactu and exporters, that there will soon be the Bush Terminal Sales Building an all-year-round permanent exhibit of ma of the most important Canadian expo

Exploiting Saskatchewan Denounced by Provincial Government

By HAMILTON BUTLER.

As a result of the discovery in Saskatchewan of numerous deposits of sodium sulphate, a mild form of "sulphate fever" has become epidemic. Already a number of companies have been formed in the province to exploit the salt beds, and various outside interests have appeared in the market for their output. One party in New York has made inquiries through the provincial bureau of labor and industries, apparently with the object of exporting the mineral in large quantities to other countries, and the Swedish Government is reported to be negotiating with certain provincial owners of sodium sulphate deposits for the purchase of great quantities for the pulp mills of Sweden.

So haphazard have been the methods of negotiation in some instances and so great the expectations based on the deposits in others, that the provincial government has been compelled to step in and warn the owners that they are pursuing a course that has already resulted in an agitation of the market which threatens to ruin an extensive and important industrial development.

Building Up Industries.

"It is highly important and in the interests of the owners of the deposits and of the province generally," says Thomas M. Molloy, commissioner of labor and industries for Saskatchewan, "that the fullest advantage of the present situation be taken to build up local industries rather than ship such valuable material out of the province for the enrichment of other countries. One method of utilizing our sodium deposits is to let large outside corporations acquire them at prices which may or may not represent their true value, since the owners have apparently not taken the steps necessary to secure definite information as to the extent or commercial value of the deposits. Another method is for the owners of the deposits to get together and market their product co-operatively in a business-like way, giving guarantees of purity of product and prompt delivery, and shipping it in such shape, as regards package, billing and invoice, as will meet the requirements of the various freight and customs regulations of the countries to which it is exported."

The commissioner appeals to the patriotism of the owners of these deposits not to alienate them or their output to extra-provincial capitalists. "Western Canada annually imports large quantities of manufactured chemicals for use in laundries, breweries, dairies, soft drink plants, soap works, and other industries," says Mr. Molloy, "and all of these can be produced from the sodium sulphate found in Saskatchewan."

Good Equipment Needed.

The owners are also warned of the dangers of attempting to enter the sodium sulphate export business without the proper equipment. "To intelligently recover and market sodium sulphate the owner of the deposit must have accurate knowledge of the purity of the deposit. This cannot be obtained from one sample taken from the deposit but only from samples showing all of the variations resulting from changing conditions as to location in the lake and depth from surface. To attempt to ship sodium sulphate without a resident chemist to closely watch the purity and chemical composition of each shipment is too great a risk, and one which may involve suits for heavy damages for spoiled materials of the manufacturer or expensive litigation from breach of contract, and above all may give to the entire industry in the province such a reputation as to exclude it from the markets of the world."

Watch Their Step.

The purpose of the government's warning to owners is to safeguard their own interests and the interests of the province by inducing the owners to watch their step in exploiting deposits, some of which have analysed over 96 per cent. pure and all of which are regarded as among the most valuable mineral assets yet uncovered in Saskatchewan. The bureau of labor and industries is securing all possible information as to the best methods of mining, purifying and marketing the various grades of sodium sulphate, and this information will be placed at the service of all interested parties.

The action of the government in the case of sodium sulphate is in keeping with the policy enunciated by the Hon. Charles A. Dunning, provincial treasurer and minister in charge of the bureau of labor and industries, for the development of the other natural resources of the province, so far as these come under provincial control.

Against Speculation.

"I am not a believer in speculative development of our resources," said Mr. Dunning recently. "The point of view of the government is that these resources can bring real benefit to the people of the province only through the industrial development of them. What I mean by speculative development is this: Great organizations of capital which at the present time control the output of a given mineral learn of discoveries of other deposits in some part of the world. The result of the development of that area would be the throwing of a great deal more of that particular mineral on the market, with a resultant decline in the value of their own properties. They immediately endeavor to acquire the mineral rights with respect to the new discoveries for the purpose of preventing the development of them. The desire is to control the property, and it is my firm belief by observation of what has happened, that the sales we hear of copper and coal properties to large American institutions are mainly for the purpose of preventing development.

"We do not desire to encourage speculative development because it is the welfare of the people of the province that we have to consider and no one can claim that the people's welfare is served by such speculative development. We desire in connection with the known resources of the province to carefully analyze them—to explore them, as it were, and then size up how this province can best co-operate in getting industries established on the ground in Saskatchewan to exploit these resources industrially."

Ten Discoveries So Far.

Some ten discoveries of sodium sulphate in Saskatchewan have come to the attention of the Bureau of Labor and Industries, and are being investigated for the purpose of establishing the commercial value of the deposits. Among the largest of the deposits reported are those near Senlac, Ceylon, Bruno, Horizon, Viceroy, Fusilier and Unity.

They vary in extent from a few acres to several hundred acres. The deposit at Viceroy covers an area estimated at about two hunderd acres. It is known to be at least three feet deep, with the greater part of it under about six inches of soil. That at Horizon is said to be even more extensive and to average between three and five feet in depth. Claims have already been filed for the mineral rights at Viceroy, as well as for those on Markakee Lake and Spring, a short distance from Bruno, where mineral salts were recently reported to have been located.

There has been practically no commercial development of these deposits to date, although several companies have been incorporated to handle their potential output. The great majority of the discoveries reported were made during the last few months. At the present time an effort is being made by the Bureau of Labor and Industries at Regina to sift the chaff from the corn, and discover not only the value of this mineral asset to the province, but the best manner of marketing it. Anyone interested in securing accurate information in regard to the possibilities of the deposits would be well advised to seek it directly from the Bureau.

The Better Furnished Homes Campaign

(*Continued on page* 78.)

ideas like moving picture propaganda, real art work and advertising specialists call for a much larger expenditure than he can afford, but by united action all these advantages can be secured at a reasonable cost.

The retailer also is helped by such a campaign. One service the Home Furnishings Bureau plans to render is expert advice on the problems of advertising, with suggestions for copy. The retail merchant is thus enabled to make his local advertisement more attractive without any additional outlay of money.

Finally the consumer gains. Augmented demand means greater production and greater production in the long run brings lower prices. But, above all, there is the satisfaction of possessing beautiful furniture. That is real and permanent though it cannot be measured in terms of money. All that the Home Furnishings Bureau can do in pursuit of its ideal deserves recognition as much from the general public as from the manufacturers who established it. Better furnished homes mean greater happiness to the consumer and incidentally to the manufacturer.

Double Plant's Capacity

A full story has been added to the present five storey factory of the Paulin-Chambers Company, Limited, at Winnipeg, Manitoba, which covers an area 100 x 120 feet. This new addition enhances the production of their candy department to a marked extent, and with the installation of a new Chocolate Department, embracing one entire flat, they are now in the position of being able to cater to the needs of Western Canada.

They have acquired a new five-storey building across the avenue from their present plant which they are equipping with two biscuit ovens and machinery of the most modern type. This new addition will double their biscuit capacity and enable them to take care of the trade of Western Canada.

The company have enjoyed a steady and sound growth for the past 37 years, being the oldest plant west of the Great Lakes.

OFFICE AND FINANCE

Filing Under the Subject Heading

How the Filing Department in the Business Office is Able to Co-relate All Letters Bearing on the Same Subject

By ALAN M. IRWIN

WHEN your correspondence is filed alphabetically it is exceedingly hard to group together all the data on record with regard to a stated subject. A considerable amount of cross-indexing or memory-searching is required in order to recall the names of all the persons or firms with whom correspondence on a given subject has been exchanged. Therebasket, collected by the files messenger and transported to the Central Filing Room, where it is stamped and mailed and where the carbon copy is detached and placed in its proper file at once. It does not matter if the letter comes from the General Manager, the Accountant or from any other officer of the company or association, it will find its correct place

The Dossier

Showing rulings as explained in the text

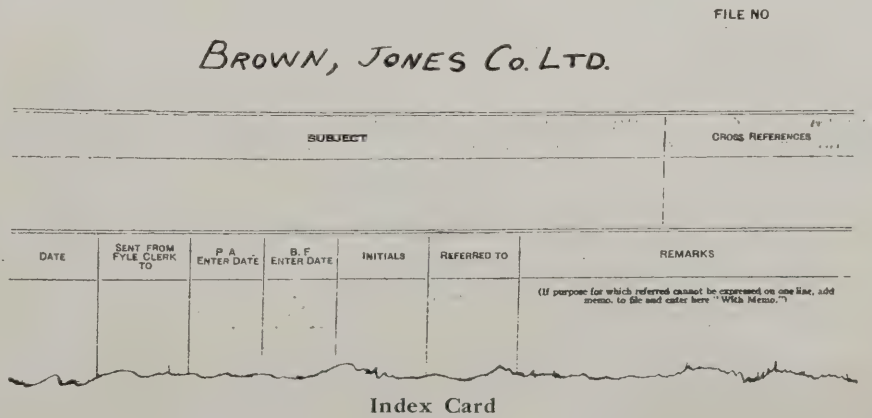
ore, to overcome this difficulty it is beoming generally a custom on the part Trade Associations, Boards of Trade, hambers of Commerce, etc., whose corspondence deals generally with subjects ther than persons, to change the phabetical system to either the subject ed alphabetically or a combination of bject headings and numeric filing.

Under either of these systems this ar's file contains the first and every cceeding letter written and received the subject by every correspondent o is in touch with business under discssion and, if called for by the General nager or President periodically, will sow him just how completely or otherse the ground has been covered.

The Office Clearing House

ll this co-related correspondence is gthered together and centralized under th subject head in the Central Filing Dartment, or, better, the Office Clearin House.

he phrase, Office Clearing House, perhs more aptly describes the Filing Dartment than any other designation, fo it is in this department that the thads of the firm's affairs are gathered tother and linked up. A letter is siged, placed in the correspondent's out and be available for anyone's perusal as soon as it is received.



How to Use the Subject File

While the writer mentioned particularly boards of trade and so forth, it is not for the reason that this system is beneficial in its effect only to that class of organization. There are many firms whose general business almost requires subject heading, if not as a particular filing system, at least as an adjunct to the system at present in existence. On account of the varied nature of these businesses it would be somewhat impracticable to give instances in this article which will confine itself to the explanation of the workings of the subject system rather than a statement of what classes of business could most advantageously employ it.

The subject file, like many other almost invaluable office devices, is easy of operation, requiring no change of equipment if there is already installed a system of vertical cabinets. Basically the system from the mechanical point of view is this:

Correspondence is indexed under subject headings with the cards arranged in alphabetical order and filed in the cabinet in numerical progression. One advantage is that as new subjects open up, no rearrangement of drawers is necessary, as the addition automatically follows the last folder in the drawer. Expansion is easily allowed for and the addition of the last two figures of the year to the classification allows transfers to be made allowing the current folders to be used continuously.

For the correspondents' information and guidance a list bearing subjects and their classifications is prepared and placed under the glass top of each desk, thus enabling them to give the classification as they dictate, and saving the time of the stenographer who heads the letter with this number instead of a written subject heading. This list is added to as the chief filing clerk allots classifica-

HEAD OFFICE . . TORONTO

tions to new subjects. It is an important part of the duty of the Filing Head to see that these lists are kept up-to-date.

An Example

A file is opened on a subject, say:

EXPORT TRADE—This is allotted the main classification of 12.

The subject expands and subdivisions become necessary, as follows:

EXPORT TRADE with South Africa—12-1.

EXPORT TRADE with United Kingdom—12-2.

EXPORT TRADE with Argentine—12-3.

The next procedure is to connect these codes with the writers and that is provided for as follows: In front of the classification on the letter head the correspondent's initials are imposed, thus:

J. B. W. 12-3

and then is added the year, thus designating the letter, as:

J. B. W. 12-3-20.

meaning that this letter is on the subject of Export Trade with the Argentine, written by J. B. Williams, and that it belongs to the current file, all this information being conveyed by the coding at the head of the letter. For letters between branches and head office a line may be ruled underneath the file number, and instead of dating the letter in the more formal manner, the date is entered under the classification, in this manner:

J. B. W. 12-3-20.

1-7

so that the branch house and the writer may eliminate the formal "In reply to your letter of," etc., and go right ahead with the body of the subject without waste of time.

If one subdivision divides into a general and a particular phase, the correspondence may still be kept together by the addition of a file indexed under the same classification, but with the addition of a letter immediately following the sub division code, for instance:

Export Trade with the Argentine (Agr. Impts.)—12–3A—20.

The different classifications are readily learned by the filing clerks because of their constant association with them and have the added advantage of being more easily filed, more easily said and, most important, MORE EASILY FOUND

The Dossier

While not absolutely an essential, the dossier or heavy foolscap folder is a very helpful accessory to the subject system of filing.

No records officer will permit pins or fasteners to remain on letters when they reach his department, and it is a pretty general custom to fasten the papers together with a large brad or brass split-pin, which pierces the top left-hand corner of the file. This, of course, keeps correspondence well fastened and together, but cannot prevent the turning up of corners, tearing of edges, etc.

For some years now the dossier has been used to a certain extent and its wider use would prove a boon to many filing clerks whose files are mistreated in their travels through the office. The dossier is made slightly larger than letter size and in appearance is practically the same as the folder

in the vertical cabinet drawer. It bears the name of the subject on the front and is ruled as per the accompanying illustration into seven columns in which directions are pencilled.

A Handy Record

The first two columns are self-explanatory, the symbols P. A. and B. F. in the third and fourth columns are respectively "Put Away" and "Bring Forward"; column five is the authority for returning the file to the filing room or the guide showing to whom the file is to be brought forward. If the file is referred to another department or correspondent his initials are entered by the original recipient in column six and instructions are given briefly in column seven. This column also gives the final disposition of the matter for the dates covered on the same line.

The code number or classification of the subject is marked in blue pencil on the top left-hand corner of the dossier, so that when the file is lying on the desk, the number is parallel to the fold and vertical. When the dossier is placed in its folder in the drawer the open end is placed downward (to the exclusion of dust) and the fold to the top, with the result that the classification appears on the top right-hand corner of the inverted dossier, i.e., the most easily visible position. Here it can be seen at a glance, and assuming the drawers to be properly equipped with stiff division boards, can be picked out just as quickly as the drawer is opened.

When a dossier is removed, it is of course replaced by a charge-out card bearing the initials or other designation of the person to whom it has been sent, and the fact that the heavy manila folder bearing the classification remains in the drawer, simplifies the operation of charging out the file, the only entries necessary being the initials of the person to whom the file is sent and the date.

Indexing is, of course, an easy matter, the only rule being that the index card must be made out coincident with the creation of a new file. Filed in the tray alphabetically, each card contains the classification of its subject and reference to it gives the guide to the cabinet in which the desired correspondence is to be found.

Procedure

1. Incoming mail.

As the mail is opened it is passed to the index clerk, who will mark the file number on the letter and place in the desk basket containing the series of numbers in which it is to be found. The clerk who attends to the cabinet containing this series of numbers will take it, draw the file, attach the letter and charge the file out, replacing the dossier in the folder with a charge-out card and place the dossier in the out basket, whence it will be lifted by the messenger and delivered to its destination.

2. Requisitions.

The routine for requisitions is the same as the foregoing.

3. Incoming files.

It is the duty of the index clerk to scan the front of all incoming dossiers, to enter them on the date index cards if they are to be brought forward, and to note the disposition of a file that is transferred. When a transfer is made it is the clerk's duty to notify the cabinet clerk concerned in order that the necessary alterations to the charge-out card may be made.

It has been found that in connection with the procedure outlined that it is possible to provide a perfect check on the activities of the various departments of the organization. It would be the duty of the chief clerk of the Filing Department to briefly scan each letter before it is passed out for the atten-

TRAVELLERS' CHEQUES

THE BRITISH INDUSTRIES FAIR

LONDON — BIRMINGHAM — GLASGOW
FEBRUARY 21st TO MARCH 4th, 1921

The Seventh British Industries Fair, organized by the British Government, will be the biggest and best exhibition of British manufactured products ever grouped together for the benefit of foreign buyers.

The Fair will be divided into three sections—with an entirely different list of exhibits in each section—no industry being permitted to exhibit in more than one section.

The London Section will be held in the White City, Shepherd's Bush, which is famous for its many successful fairs. Here will be shown such products as:—Leather and Fancy Goods; Watches and Clocks; Furniture; Musical, Optical, and Scientific Instruments; Brush, Glass, China, Earthen, and Basket Ware, etc., etc.

In the Birmingham Section—a distance of only 2½ hours by rail from London—there will be exhibits of:—General Hardware; Tools; Alloys and All-Metal Products; Motor Cycles; Accessories for Motor Vehicles; Aeroplanes, etc., etc.

The Glasgow Section opens on February 28th in Glasgow—a ten hours' journey from London. The exhibits in this section will include:—Textiles of all kinds; Clothing; Hosiery; Hats; Caps; Shoes; Gloves; Carpets; Foodstuffs; Beverages; Chemicals and Chemical Products, etc., etc.

Every possible assistance will be given to visiting buyers. The Department of Overseas Trade of the British Government has offices right on the grounds, where all information *re* supply, tariffs, shipping, exchange, etc., is readily obtained. Writing rooms, special Post and Telegraph Offices, and restaurants, are installed for the buyers' convenience.

A visit to the British Industries Fair will enable Canadian buyers to make their purchases at a great saving of time and travelling expense. Invitations and complete information, catalogues, etc., will be furnished on request by the British Trade Commissioners in Canada, or by the Fair's Secretary, 35 Old Queen Street, Westminster, London.

You cannot afford to miss this Fair. If you cannot attend and have no representatives in England, the British Trade Commissioners will recommend responsible brokers.

tion of the department to which it is addressed. This chief clerk, who should be skilled in the art of precise writing, will dictate a brief memo. to be incorporated in the list, giving the name of the firm writing, department to which it is addressed and a brief synopsis of the letter. This information will be compiled daily by his stenographer in a report which may be placed in a loose leaf book. At the close of each day the chief stenographer passes to the chief clerk of the Filing Department third copies of all letters written by all departments during the day. In the morning these third copies are checked over against the list and as with the incoming a brief synopsis of the reply is placed alongside the original report. In the case of letters which have not been replied to in two or three days whichever limit may be fixed by the Manager, a short note will be sent to the departments which are behind in their correspondence. In this way, not only are the firm's correspondents kept up-to-date, but a very handy and concise report of the firm's activities is outlined by this report.

Pass a Transfer Slip

Under no circumstances should a file be passed from one correspondent to another unless a transfer slip is passed to the filing department. In a small office all files for transfer may be collected by the files messenger and routed to their new destinations by the filing department.

A system of this nature may be adapted to many types of organization and will, if efficiently handled, be a means of eliminating unnecessary duplication and thereby reducing expense by the adoption of the principle of—ONE SUBJECT, ONE FILE.

Stock Reorganization

Shareholders of Price Bros. & Company, Limited, Asked to Ratify Directors' Recommendation

Definite announcement was made on October 11th respecting the capital stock reorganization of Price Bros. & Company, Limited. A new company with the same name as the old firm has been created to take over the assets and business of the present company as a going concern. A circular, addressed to shareholders of the present company asks them to pass upon the recommendation of the directors at a meeting to be held in Quebec on Monday, October 25th. The transfer of shares, probably on the basis of five for one, is to become effective on November 1st if the shareholders approve the proposal.

The circular, which is signed by the President, Sir William Price, after giving notice of the special meeting, states that shareholders are asked:—

(1) To take action in approval or disapproval of the proposed sale, conveyance, transfer and delivery to Price Bros. & Co., Limited, a corporation created by letters patent of the Province of Quebec issued in 1920, of all the undertakings and assets, movable and immovable, corporeal and incorporeal, for the following consideration:—

(a) 426,710 shares of $100 each, fully paid up, of the company's capital stock.

(b) The assumption by the company purchaser of the outstanding bonded debt and other liabilities of the company outstanding as on November 1, 1920.

(c) The undertaking by the said company purchaser to carry out all contracts, agreements and obligations of the company existing on the said date.

(2) To consider and approve or disapprove a resolution of the Board of Directors relating thereto.

(3) To consider and determine such other and further

matters in any way incidental to or connected with the foregoing as may be brought before the said meeting.

In a further communication, Sir William Price states:—"In view of the conditions which prevail I have no hesitation in recommending that the shareholders avail themselves of this offer of purchase."

The capital stock of Price Bros. presently outstanding is comprised of 85,342 shares of a par value of $8,534,200 with 5 per cent. bonds, as at the end of February last, totalling $5,172,098.

Profits Have Declined

Annual Statement of Ogilvie Flour Mills Company, Limited, Shows Decrease in Revenue

The annual statement of the Ogilvie Flour Mills Company, Limited, submitted to the shareholders at the meeting held in Montreal on October 14th, shows a decline in net revenue for the year ended August 31st. During the period profits from all sources, including income from investments and after deducting bond interest, amounted to $959,065, a decline of $673,451, or some 45 per cent. from the level shown in the previous statement, and a decline of $996,349 from that of 1918.

For the first time in a number of years profits from milling operations and those from investments are shown in the aggregate rather than in the segregation, so that conclusions in respect to the industrial conditions and their outcome are difficult to arrive at. About a year ago the company announced a bonus distribution among holders of its common stock of 15 per cent., but this was reduced to 10 per cent. in the recent declaration, thus indicating that the revenue from investments, out of which the bonuses were paid, had undergone some impairment in the twelve months.

Discussing the results of the year's operations in a brief address to the shareholders, W. A. Black, vice-president and managing director of the company, stated that the milling business during the period covered by the statement had been far from satisfactory. The control of wheat and its products had been vested in the Wheat Board, and during a considerable period of the year the prices fixed by that body had resulted in a positive loss to the mills. Fortunately, he stated, the interests of the Ogilvie Company were not confined to milling alone, and satisfactory profits in other branches of the enterprise's activities had been made.

Mr. Black stated that while wheat control had ceased in Canada, it was still in force in the Old Country, but he expressed the hope that, with the advent of spring, the restrictions would cease there also, and permit of the resumption of normal conditions between the millers and their overseas customers.

Russell Earnings Lower

Profits of Russell Motor Car Company, Limited, Are Less But Outlook Is Hopeful

The financial report of the Russell Motor Car Company, Limited, for the year ended July 31st, shows earnings of 28.2 per cent. on preferred stock, and 31.8 per cent. on common. For the previous year earnings on preferred stock were 38 per cent., and earnings on common were 46.06 per cent. The company have made final adjustments with respect to munition contracts and are now turning to peace operations. In spite of the reduction in profits this year a hopeful outlook for the future is expressed by the president, Lloyd Harris.

Regarding Willys-Overland, Limited, an important subsidiary of the Russell Company, the following information is given: "This company has completed the conversion of its

What Is Ahead of YOUR Business?

plant from airplane engine work to automobile work, and during the first six months of the calendar year enjoyed an active demand for its product. Since July first it, in common with other motor companies, has experienced a contraction of sales, and its operations are being carried on at the present time on a reduced basis. It is expected, however, that there will be a renewed demand after the first of the year, when returns from the crops have had time to get into general circulation."

Other subsidiaries are the Canada Cycle & Motor Company, Limited, and the Russell Gear & Machine Company. The former paid a dividend of 7 per cent. on the capital stock on September 1st. The latter company, who were formerly known as the Machine & Stamping Company, Limited, have taken over the machine equipment of the Russell Motor Car Company, Limited, with a view to carrying on a general machine business. The capital stock was increased to $1,000,000, all of which except qualifying shares is held by the Russell Motor Car Company.

Bank of Montreal

Bonus of Two Per Cent. Declared on Business for the Current Year

At the last meeting of the Bank of Montreal board of directors, a bonus of 2 per cent. for this year only was declared in addition to the regular quarterly dividend of 3 per cent. In connection with this declaration, the bank desired it to be understood that there had been no increase in its interest rates to borrowers in Canada and that the additional distribution to shareholders was the result of a successful year's business and the enhanced value of money outside of Canada, where the bank's reserves are to an extent carried.

This bonus to the shareholders is a further evidence of the bank's progress during the year and an indication that Canada is steadily advancing through the re-construction period to sound normal conditions.

Cockshutt Profits Increase

Annual Report of Cockshutt Plow Company, Limited, Shows Substantial Increase in Net Profits

The annual report of the Cockshutt Plow Company, Limited, shows an increase in net profits from $571,586 to $660,921. Dividends amounting to 7½ per cent. on preferred stock were paid, as against 4 per cent. in the previous year, and the balance at credit of profit and loss was $576,434 as against $399,387. Loans were reduced from $594,767 to $124,924. Earnings on preferred were at the rate of 10.23 per cent., as compared with 8.84 per cent. in the previous year.

According to President H. Cockshutt there has been a large and well-sustained demand for the company's product during the year, and an even greater volume of business could have been done if the company had been in a position to accept all the orders offered to it.

"This was prevented," says Mr. Cockshutt, "not only by the difficulty in obtaining labor and material, particularly the latter, but by the insufficiency of the company's plant to meet a greater demand upon its capacity. In order to deal with the situation the directors decided that considerable additions should be made to the plant at Brantford, and the buildings are now well advanced. The continued growth of our business, combined with the very high prices now prevailing for the principal raw materials used by the company, will require a greater amount of money than has been needed in the past for the purpose of carrying the necessary raw materials and goods manufactured and in process. The same situation exists in the company's subsidiary and allied companies.

The subsidiary companies, Adams Waggon Company and Brantford Carriage Company, have had a very successful year, working to capacity, and showing substantial betterment. The Adams Waggon Company has not been able to cope with the business offered it, and, consequently, has been forced to consider increased facilities. This company was offered the Petrolea Waggon Company's plant at Petrolea, fully equipped with modern machinery, and it has secured it under lease, with an option to buy. This plant is now operating, and as soon as a full supply of material can be secured will be worked to its capacity.

Carriage Factories, Limited

Annual Statement of Orillia Firm Shows Deficit and Reduction of Liabilities

Carriage Factories, Limited, of Orillia, Ontario, have issued their annual statement for the year ended July 21st, 1920. A deficit amounting to $36,845 is shown for the twelve months, as compared with one of $27,531 for the previous year.

Gross profits for the year were $302,635, to which is added the sum of $32,860 under the item, sundry revenue, giving a total of $335,496. Against this is charged $157.488 under the heading "administrative and selling expense," which brings the earnings down to $178,007. Further charges of $214,852 are set against this sum, which results in the net loss carried to current surplus of $36,845. The amount of $214,852 charged against the earnings, after the deduction of operating expenses, is made up of the following items: Bond interest, $28,692; bank interest and charges, $51,316; bad debts reserve, $17,162, and reserve for inventory, $117,681.

Total assets amount to $3,898,364, of which $904,969 comes under the head of inventories, which is somewhat under the same item in last year's report, which stood at $965,567 (less reserve in each case). Liability to the Town of Orillia is $25,000, which shows a reduction in this regard from last year, when the liability was $27,500. Bank loans and overdraft are $609,284, against $715,435 a year ago, which displays a decline of over $100,000 in borrowing.

Announcement was made on October 14th that Sir Lomer Gouin, formerly Premier of Quebec, had been elected a director of the Cockshutt Plow Company, Limited, Brantford, Ontario, at the request of British and French shareholders in the company. European investors in the company are already especially represented on the board by Sir Augustus Hanton and F. Perry.

T. Williamson was re-elected president of the St. Lawrence Flour Mills Company, Limited, at the annual meeting of the company's shareholders. The remaining directors, A. E. Labelle, George D. Grier, C. J. Fleet, and Joseph Quintal were also re-elected.

At the last meeting of the Canada Life Assurance Company, Sir Thomas White was elected a director to fill the vacancy caused by the death of Alexander Bruce, K.C.

At a recent meeting in Toronto, T. W. McGarry, K.C., was elected president of the Whalen Pulp and Paper Mills, Limited, succeeding Sir George Bury. The following were also elected to the executive:—I. W. Killam, Montreal; M. J. Haney and W. G. Ross, Toronto, and M. R. Higgins, San Francisco.

Canada's Industrial Expansion

A Record of Progress

Making Hydraulic Machinery

The Dominion Engineering and Machinery Co., Ltd., are Canadian Manufacturers of I. P. Morris Turbines

In 1918 Dominion Bridge Co., Limited, whose machining capacity had grown largely during the war, started the manufacture of paper machines, which had not previously been made in Canada. The machines were at first built in the Dominion Bridge Company's machine shop at Lachine, but the department grew so rapidly that towards the end of 1919 it was decided to buy the St. Lawrence Bridge Company's shop at Lachine, and to handle the department as a separate organization. The Dominion Engineering & Machinery Company, Limited, were, therefore, organized for this purpose, being entirely owned and operated by the Dominion Bridge Company, Limited.

Soon after their organization the new company were approached by several individuals who had been looking for a shop in which to manufacture large hydraulic turbines. These individuals were interested in several of the large power companies of Eastern Canada and were working hand in hand with the Wm. Cramp & Sons Ship & Engine Building Company, of Philadelphia, manufacturers of the I. P. Morris Turbines and Hydraulic Machinery. The Dominion Engineering & Machinery Company shop was eminently suitable for their purpose and a decision was made to combine forces and to reorganize the new company on a larger scale, to build both the paper and the hydraulic machinery.

The Dominion Engineering Works, Limited, were organized and commenced business in May, 1920, with a capital of eight million dollars and the following directors: President, G. H. Duggan; vice-presidents, A. J. Brown, Julian C. Smith; directors, W. F. Angus, Geo. Chahoon, Jr., Sir Herbert Holt, Phelps Johnson, J. M. McIntyre, Howard Murray, Carl Riordon, H. B. Taylor, F. L. Wanklyn.

The Dominion Engineering Works, Limited, shop is situated at Rockfield, within the City of Lachine, Quebec. It is served by both the Grand Trunk and Canadian Pacific Railways, and the property is sufficiently large to provide for future extensions.

The company, though equipped for almost any kind of heavy foundry and machine work, intends to specialize in the manufacture of paper machines and accessories and water turbines. A modern grey iron foundry has been built, equipped for the largest work. This foundry is 145 ft. x 350 ft. and is served by 70-ton and 15-ton cranes to which a 35-ton crane is being added. There are three cupolas, 37 ins., 54 ins. and 84 ins. Special pits for paper machine dryers and a large pit 30 ft. x 120 ft. for turbine work. The foundry is equipped with sand-blast apparatus, jolt machines, rammers, etc.

The machine shop, which is the old main shop of the St. Lawrence Bridge Company, is 660 ft. x 160 ft. with a side bay 60 ft. x 440 ft. The east third of the shop is higher than the remainder and is served with one 70-ton and two 35-ton cranes. Here most of the hydraulic work and the heavier part of paper machine work will be done, and in this part will be situated such large machine tools as the 18-ft. and 35-ft. vertical boring mills, the 12 ft. x 20 ft. horizontal boring mill, and the special dryer-lathes and grinders. The remainder of the shop is served by 10-ton and 40-ton cross-cranes and has a general machine tool equipment, with a specially large number of long roll turning lathes for paper machine work, roll-grinders, etc. There is a large space for the erection of machinery. All tools are operated by electric power purchased from the Montreal Light, Heat & Power Company.

The pattern shop is in a separate building formerly used by the St. Lawrence Bridge Company as a template shop. The Company have not as yet built an office building but their offices are at present housed in the Dominion Bridge Company's office building at Lachine, about half a mile distant from the works.

The Company have a large amount of work on hand. They have nearly completed two large newspaper machines for the Laurentide Paper Company. These are high-speed machines, 166 inches wide, and are of the most modern construction. They are also completing a large tissue paper machine for the Interlake Tissue Mills Company and have several other paper machine contracts on hand. In the Hydraulic Department they have contracts for two 20,000 h.p. turbines for the Laurentide Power Company, two 10,800 h.p. and one 1,500 h.p. turbines for the Cedars Plant of the Montreal Light, Heat & Power Company, and four 2,700 h.p. turbines for the Spruce Falls Company, Limited. All of these turbines are of the I. P. Morris design.

New Paper Company

Three Rivers Pulp & Paper Company, Limited, Plan to Operate by November, 1921

A new entry in the pulp and paper field is the Three Rivers Pulp & Paper Company, Limited, of whose stock issue a prior offering is being made to shareholders in the Hollinger Consolidated Gold Mines, Limited. Upwards of two million dollars of the preferred stock issue has been subscribed by the directors of the Three Rivers Company, whose names are given below. The remainder is offered first to Hollinger shareholders and any portion not taken up by them will be offered for public subscription.

The company state in their prospectus that they intend to proceed at once with the erection of a thoroughly modern ground-wood pulp mill, with equipment of the latest design and an initial capacity of 100 tons per diem (30,000 tons per annum). The mill is to be situated at Three Rivers, on a suitable site already secured, with excellent rail and water shipping facilities, and of an area ample for further extension of the plant. The site secured has a frontage of 1,500 feet on the St. Lawrence River, where ocean steamers can load at the company's own dock. Rail shipments will be

handled by siding connection with the C.P.R. It is planned to have the mill in operation in November, 1921. There is an ample supply of standing timber on the company's limits.

The authorized capital of the company is $4,000,000 in 8 per cent. preferred shares, with 80,000 common shares of no par value, all of which is to be issued. The head office is in the Drummond Building, Montreal. On the board of directors are: President, N. A. Timmins, president of the Hollinger Mines; vice-president, Denaston Breakey, president John Breakey, Limited; L. H. Timmins, Colin Breakey, R. J. Whyte, J. W. Smith, W. L. McDougald, W. P. Kearney, and D. A. Dunlap.

Nearing Completion

Owen Sound Cereal Mills, Limited, Expect to Commence Operations by November 15th.

The plant of the Owen Sound Cereal Mills, Limited, at Owen Sound, Ontario, is rapidly nearing completion, and it is expected that everything will be ready for the commencement of operations by November 15th. The company have purchased a four-storey stone building 200 x 100 feet, and will employ about twenty men. The products are oatmeal, split peas, pot and pearl barley, millfeeds, flaked wheat and cracked wheat. The mill has a capacity of some 250 barrels per day. According to the Owen Sound *Sun and Times* a great deal of the split pea product will be exported as there is a great demand for it in Central and South America.

The company took over the business of Duncan Haston & Company, and Matthew R. Duncan is president of the new concern. The other directors are:—Morley D. Lemon (vice-president; H. I. Price (secretary-treasurer), Charles Thompson, William Haston, R. Patterson, E. W. McQuay. The authorized capital is $100,000.

New Lumber Mill

La Compagnie Jos. Lefrancois, Ltee., Will Operate New Mill Early in November

A new lumber mill is being erected at Limoilou, Quebe by La Cie Jos. Lefrancois, Ltée., and will be in operatio early this month. It is a structure 125 x 110 feet, built concrete blocks and with concrete floors. The equipme will consist of one carriage with circular saw, one band r saw, one rip saw, two high speed planers and matchers, tw surface planers and two stickers or moulding machines. Th estimated output is 50,000 feet of dressed lumber an mouldings a day. From 30 to 35 men will be employed.

The company are a limited one capitalized at $98,00 Jos. Lefrancois, of Quebec, is president; J. E. Vallée, Beaufort, vice-president, and J. M. Dessureault, of Quebe secretary-treasurer. Other directors are A. Dessureault, Quebec, and J. A. Rousseau, of Ste. Anne de la Perade.

Chocolate Plant Extends

Rockland Cocca & Chocolate Company, Limited, Conne Their Two Existing Buildings

The Rockland Cocoa & Chocolate Company, Limited, a connecting the two existing buildings of their plant at and 20 Duncan Street, Toronto, by an addition which wi give an added floor space of 4,332 feet. This will be use chiefly for manufacturing purposes and storerooms, and wi increase the present capacity and output of the plant about ten per cent. The company expects that the alter tions will be completed by the 20th of November.

Cafeteria Equipment

Office and Factory - 154 George Street, Toronto

So They Called the Expert In

Fred Brock of Baxter and Company was a good Office Manager. That was an acknowledged fact, both among his business associates and the boys at the club. People discussed his organizing ability and the capable staff with which he had surrounded himself.

ONE thing troubled Fred, though: his filing system and certain details of office routine. In the rush of two years of unprecedented business he'd no time to re-organize his system. As a result it had become unwieldy; papers were becoming increasingly difficult to find; complaint reports were coming in with greater frequency from the "Chief" and other department executives, so Miss Thompson, the filing clerk reported.

That was just a year ago—before Fred Brock called to his aid the System Service Expert of "Office Specialty". His business day is much pleasanter for him now—since the "Office Specialty" System Expert analyzed his existing systems and submitted a plan that would not only remedy the immediate trouble, but make ample provision for natural expansion for some time to come.

This is the type of expert service that "Office Specialty" is rendering to its thousands of clients to-day— a concrete service backed by the resources of a centralized System Department whose cumulative experience in solving filing and record-keeping problems in many different kinds of business is offered to you in your individual problem without fee or charge, or without reservations of any kind.

SYSTEM SERVICE

"Office Specialty" System Service Experts are men who merit the name *expert*. They are trained, practical men. They will gladly make your office routine, record-keeping, or filing problems their own. Their value to themselves, and to us, depends upon the value of their service to you.

Put your office routine or record-keeping problem up to our nearest Service Store.

Now In Operation

Anglo-Canadian Wire Rope Company, Limited, Have Completed Plant at Lachine, Quebec

The Anglo-Canadian Wire Rope Company, Limited, who were incorporated in June of last year, have completed their plant at Rockfield Station, Lachine, Quebec, and have already manufactured several thousand feet of steel wire rope. The newly-erected factory is especially designed for this purpose and is equipped with machinery of the latest type, evolved after years of experience of the best ropemakers in Great Britain. It has been imported from the best makers of this class of machinery in England. Many delays were experienced while obtaining it, owing to unsettled conditions, but at the end of last August the plant was put into running order.

The Company are capitalized at $200,000 and have their head office at 374 Beaver Hall Square, Montreal. The following constitute the board of directors:—D. W. Clark (president), Canadian B. K. Morton Company, Limited, T. S. Morrisey (vice-president), R. M. Davy, G. H. Atkinson, G. D. L. Hunter. The Canadian B. K. Morton Company are appointed sales agents for the whole of Canada.

Separate Company Formed

Canada Fire Brick Company, Limited, Handle Fire Brick Business for Two Other Companies

The Canada Fire Brick Company, Limited, have been organized to take over the affiliated fire brick interests of the Montreal Fire Brick Works Company, Limited, and the Canada Supply Company, Limited. These companies have been working together for the past year, but it was deemed advisable to incorporate a separate organization for handling the fire brick business.

The head office will be located at 418 St. James Stre Montreal, where all orders and correspondence should addressed. The plant at 399 St. Ambroise Street has be rebuilt and enlarged. Modern equipment and kilns ha been installed with facilities for stocking standard shap and every effort will be made to give customers reliable a satisfactory service.

To Build New Plant

Crouse-Hinds Company of Canada, Limited, Buy Five Ac Site in Toronto

Five acres of land at the corner of Hanson St. and C well Ave., Toronto, have been purchased by Crouse-Hin Company of Canada, Limited, manufacturers of electrical a pliances, and plans and specifications for new buildings a now being prepared. These will be three in number. T main building will be either three or four storeys high a 500 x 80 feet. The foundry will be 300 x 60 feet and a tw storey, fire-proof pattern warehouse approximately 100 f square will also be built. The whole will be a modern da light plant of the best brick and mill-type construction, co pletely sprinkled throughout.

It is planned to break ground about May 1st, 1921, so th the plant may be ready for occupancy by November 1st, 19 An amount in the neighborhood of $500,000 will be invest in the buildings alone.

At present No. 1 factory of the company is on Lab Avenue, and factory No. 2 is on Carlaw Avenue, Toron When the new plant is complete three companies will oper in these buildings, namely: Crouse-Hinds Company of C ada, Limited; Harvey Hubbell Company of Canada, Limit

New Factory Opened

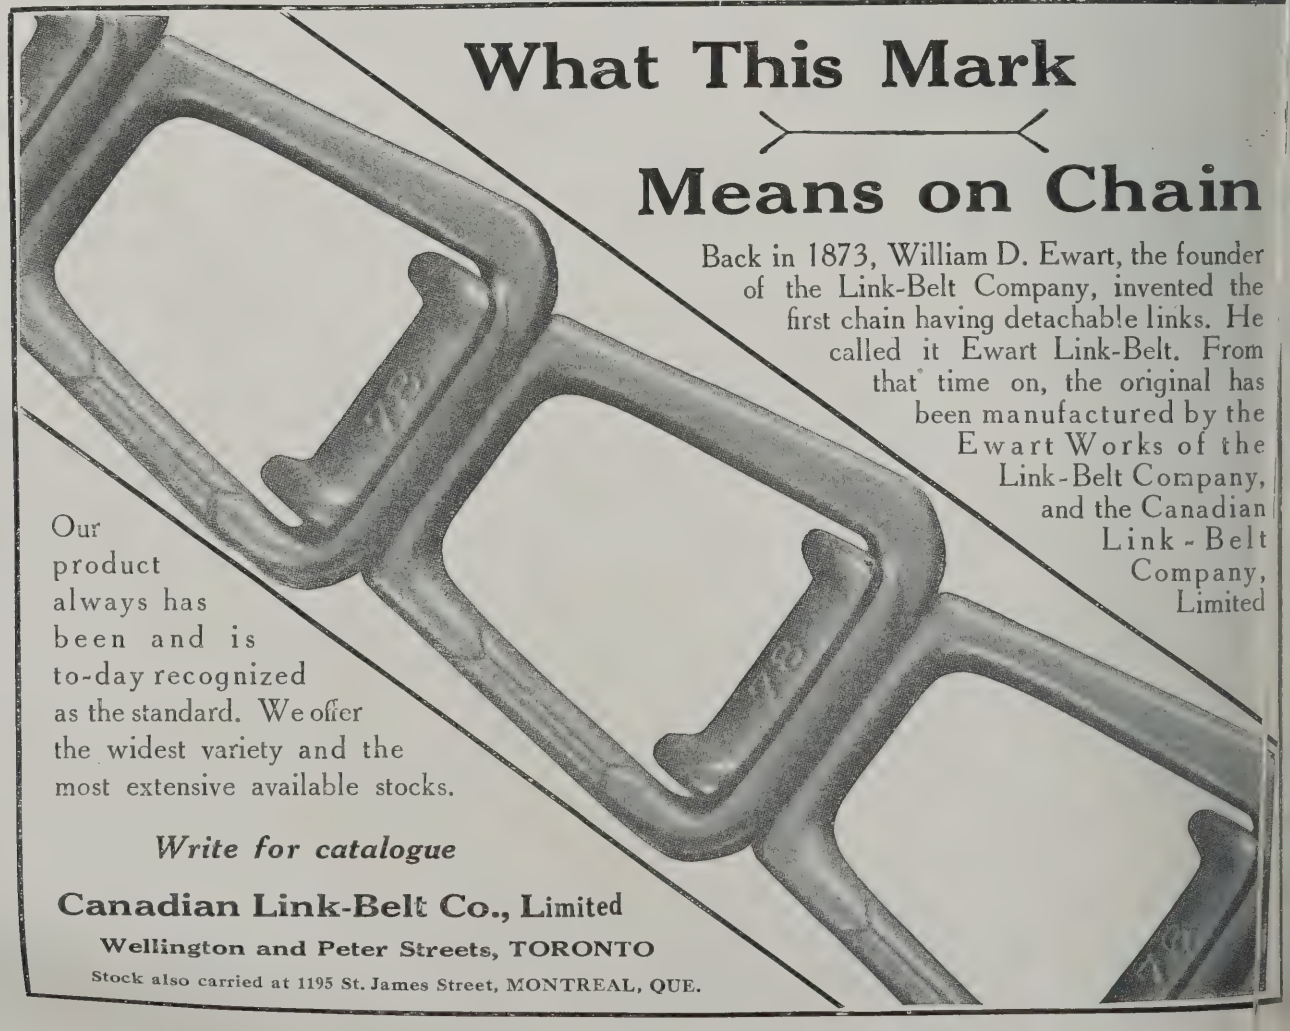
Congoleum Company of Canada, Limited, Manufacturing Rugs and Floor Covering in New Factory

On September 1st the Congoleum Company, of Canada, Limited, commenced manufacturing operations in their new factory on St. Patrick Street, Montreal. This plant is a four-storey building with approximately 100,000 square feet of floor space. It is being used for the production of art rugs and floor covering of the Congoleum "Gold Seal" brand. These former are of various sizes, ranging from 6 x 9 to 9 x 12. The plant has a capacity of 1,500,000 square yards of floor covering and 175,000 of rugs per year.

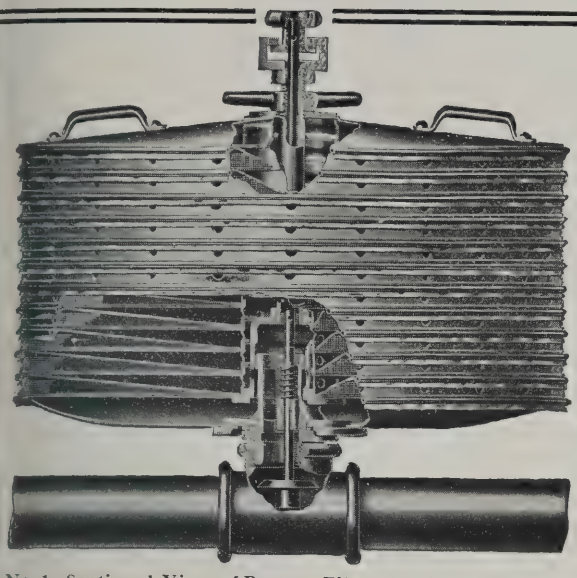
Will Make Wire Goods

The Richmond Wire & Iron Company, Limited, Have Secured a Site at Richmond, Quebec

The Richmond Wire & Iron Company, Limited, are a new organization that are offering securities to the public in the form of an issue of $150,000, eight per cent. cumulative redeemable preference stock, says *The Financial Post.* The capitalization of the company is $1,000,000, with preferred stock of $550,000 authorized, and common stock of $450,000. The preferred stock is being offered at $100 per share, carries with it a bonus of 40 per cent. common stock.

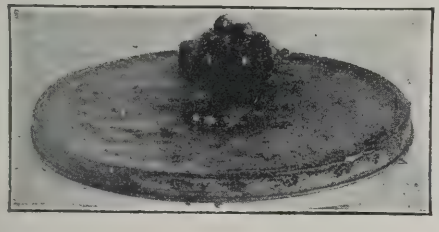


The purpose of the company is to erect factories engage in the manufacture of wire goods of every des tion for household, farm, factory, business and other including stamped metal goods, electrical goods, autom specialties, metal fittings for trunks and leather goods, auger bits, wrenches, forgings, etc. It is of interest to that the prospectus declares that over 60 per cent. of t goods used in Canada at present are imported from United States and other countries, and that during the fiscal year the importations into Canada of small hard and metal goods amounted to about $28,000,000.



The company have secured a site of six acres at Richm Quebec, and will receive exemptions from taxation and c privileges from the town. Electric power will be purch from the Southern Canada Power Company. A special e will be made to secure as shareholders of the company h ware dealers who may become customers of the factory. of the conditions held out to them is that they will re an extra discount of 10 per cent. on the regular list o lines manufactured by the company. It is the purpos the company to deal directly with the retail trade.

New Machine Room



Don Valley Paper Company, Limited, Build Additio House Paper Machine

The Don Valley Paper Company, Limited, of Toronto, completed the addition to their plant. This consists

No. 1—Sectional View of Bowser Filter Section Assembled

No. 2—Filter Disc with Dirt Filtered from Oil.

It Gets the Dirt
It's a BOWSER Oil Filter

ESTABLISHED 1885

The pictures shown here illustrate the Bowser Filter Section as used in the Bowser Oil Filter.

No. 1 shows the Filter Section assembled, ready for use. No. 2 shows one of the Filter Discs with dirt that the Filter has collected from used oil. This pile of dirt is about 6″ in diameter and from 2″ to 3″ high.

There are twelve of these Filter Discs and Cloths in a Bowser Filter Section—each as effective as the one you see pictured. As many complete Filter Sections as needed are furnished in the Bowser System. You may judge for yourself as to the value of such equipment.

Bowser Systems are applicable to any size and type of power producing and transmitting machinery.

We will be glad to send literature and explain to you how the Bowser principle of Oil Filtration can be applied to your Boiler plant.

new machine-room about 43 x 120 feet, built to house their present machine, at a cost of $20,000. The Company do not expect any immediate effect on output to result from the addition.

Making Floor Lamps

McGill-Quinn Handcraft Products to Make Fibre Furniture, Etc., at Norwood, Ontario

McGill-Quinn Handcraft Products is the registered name of a manufacturing business now being carried on by E. McGill-Quinn, at Norwood, Ontario, the present product being woven floor lamps. The firm hope soon to be able to turn out about two thousand of these per month, and later will devote their energies to the production of fibre furniture. This latter development must be postponed until additions can be made next spring to the present plant.

Fibre furniture is practically a new thing for Canada. The company state that while it is sometimes spoken of as a substitute for reed, rattan and willow furniture, it can be made superior to these in durability and finish when proper treatment is used in the finishing process.

Make Hardwood Flooring

MacDonald Lumber Company Commence Manufacturing in Maisonneuve Plant

The Macdonald Lumber Co., wholesale lumber dealers, Toronto, have commenced the manufacture of hardwood flooring at Maisonneuve, Montreal, and are meeting with encouraging results. Although only in operation a short time, the company are making ready to add new equipment and to increase the capacity of the plant. lish rather than the American style, as they feel that English pocket cutlery is more durable than that produced in the United States. To a large extent, however, American processes will be used in the manufacture, and the plant will be equipped with the most improved mechanical devices known in this line of manufacture. The Company are purely Canadian in their formation and capital and for the time being at least will manufacture entirely for the Canadian trade.

Their raw materials, unfortunately, will have to be secured for the time being outside of Canada, horn for handle material and blade steel coming from England, and spring, lining, and bolster steel coming from the United States. The Company are anxious to buy from Canadian steel mills, but as yet have been unable to obtain quotations from any of these.

New Hamilton Industries

Don-O-Lac Company of Canada, Limited, and Canadian Metleskin Company, Limited

Two new industries to locate branches in Hamilton, Ontario, are the Don-O-Lac Company of Canada, Limited, and the Canadian Metleskin Company, Limited, whose parent companies are in Rochester, New York. Both are capitalized at $50,000, and between them they will have about 50 employees. They are under the one management, and at present will occupy joint premises in a building at the corner of Bay and Murray Streets which they have leased. It was formerly occuped by the Dowswell Manufacturing Company. Should building conditions improve next year they expect to erect separate buildings. The products of the Don-O-Lac Company are shellacs, enamels and paints, and the Metleskin Company manufactures power plant products and boiler-room supplies.

Another Hamilton Company

Boyce-Moto Meter Company, of Long Island City, E. lishes Canadian Branch

Another branch industry for Hamilton, Ontario, i nounced by C. W. Kirkpatrick, Commissioner of Indus and Publicity. This is an offshoot of the Boyce-Moto M Company of Long Island City, U.S.A. The moto-meters by this company are standard equipment on 176 diff makes of pleasure cars, trucks and tractors. At their U States plant last year 1,380,000 moto-meters were turne and about 41,000 of these came to Canada. The Com now intend to manufacture them in this country bot Canadian trade and for export. They have leased temp premises with the intention of building later. At the of writing their Canadian organization has not bee nounced, but Samuel E. Ryder, who has been Detroit ager up to the present time, has been appointed ma of the Hamilton branch.

Now Building Plant

Bates Valve Bag Company, of Chicago, Locating Br at Niagara Falls, Ontario

NEW GLASGOW, N.

Quicker Than Thought!

"Fifty-nine seconds after the alarm was given the first stream was turned on the fire."

Quick work!

But the Grinnell beats it always by minutes, often by ***hours***.

With ordinary fire-fighting apparatus, a fire must be ***seen*** before it can be attacked and only too often this means that it is too late for any effective fighting to be done.

But "way back" in the darkest corners, out of sight and hearing, the silent little Grinnell sentinel is everlastingly watching for that first rise in temperature that indicates that the fire is just ***beginning***.

Often before the fire is ***seen*** by any human being—"Click!" "Splash!" and a deluge of water from the Grinnell Sprinkler overhead has placed it definitely among the "might have beens."

And the surprising part of it all is that it actually costs less to protect your building with Grinnell Automatic Sprinklers than to do without them.

Your insurance man knows and will tell you just how much a Grinnell installation will save you each year, in premiums alone.

Important

Heretofore the underwriters have often required a tank supply for automatic sprinklers in addition to the city mains. Now, however, Grinnell Sprinkler equipments can often be installed without a tank.

INDUSTRIAL KITCHENS

The furnishing of equipment for Industrial Kitchens is a specialty of McCLARY'S. Every detail, and there are many, has been mastered by our experts; large or small, complicated or straightforward specifications, are handled with equal care.

During the past few years we have had a large experience in this class of work. Architects and buyers of this equipment have proved to their entire satisfaction that McCLARY'S activities are not solely confined to the manufacture of Good Stoves and Cooking Utensils.

The development of the Cafeteria or Cafe for industrial organizations has been very rapid of late. Employers of labor realize that this system of having pure, healthful food available for sale at reasonable prices, right within convenient reach, is very beneficial to the moral of their workmen.

It is not sufficient, however, to merely approve the establishment of this new departure; it is very essential that no risks should be taken in its satisfactory installation.

It is with perfect confidence that we, McCLARY'S, offer our services to any architect or buyer who desires to obtain specification, layouts and prices without obligating himself. Our experts are ready at any time to give their personal and courteous attention to any enquiry submitted.

Our nearest branch will deal promptly with a written request.

Making Motor Trucks

Gotfredson-Joyce Corporation, Limited, Estimate First Year's Output at Over One Thousand

The Gotfredson-Joyce Corporation, Limited, were incorporated this year under a Dominion charter, and are manufacturing G. & J. motor trucks at Walkerville, Ontario. Benjamin Gotfredson and Robert Gotfredson are president and vice-president respectively of the company, and Frank H. Joyce is secretary-treasurer. The company expect to produce between one and two thousand trucks during their first year of operations and are employing about one hundred hands. The capitalization is $100,000, all paid in in cash.

Lumber and Pulpwood

Franquelin Lumber and Pulpwood Company, Limited, Are Subsidiary of Ontario Paper Company

The Franquelin Lumber & Pulpwood Company, Limited, are a subsidiary of the Ontario Paper Company, Limited, operating at Franquelin under the presidency of W. H. Eshbaugh. Lumber and cut wood in 4-ft. lengths are the products, and from one to six hundred men, according to the season, are employed. The paid-up capital is $850,000. About one hundred and twenty-five square miles on the Franquelin River are comprised in their timber limits.

Feed Meal Plant

Mount McKay Feed Company, Limited, Will Soon Complete New Buildings

The plant being erected at Fort William, Ont., by the Mount McKay Feed Company, Limited, is well under way and should be grinding by November 15th. The company are a limited stock company with paid-up capital of $35,000 and employ from five to seven men. The plant consists of a small elevator and feed plant with floor space of 8,500 square feet and capacity for storing 200 tons of hay. The elevator capacity is 10,000 bushels and the output of the feed mill will be 20 tons a day. All kinds of chop feed and feed meal will be manufactured, poultry supplies being a specialty.

Manufacturing Fertilizers

Pacific Guano Company, Limited, Are in Operation at Barnet, B.C.

Among newly-organized Western companies are the Pacific Guano Company, Limited, which was recently started by C. H. Devine at Barnet, British Columbia. The products of this company are fish meal and fish oils obtained from any suitable kind of fish or fish offal. As there are legal restrictions against using any fish that is good for human consumption the suppy of raw material is variable, but since manufacturing operations commenced, on July 12th last, the plant has run from eight to ten hours a day.

Dogfish is one of the chief forms of raw material and can be procured in large quantities from November to April. From April to November, when there is no dogfish to be had, the supply of other fish from packing-houses is spasmodic. A supply is also obtainable from cold storage fish that have spoiled.

The plant running twenty-four hours would take from 16 to 20 tons of fish which would yield about four tons of fish meal worth $100 a ton, and some 160 gallons of oil worth from 65 to 75 cents a gallon. The cooker holds about 3½ tons and a cooking. The hydraulic press has a pressure of 2,500 lbs.

to the square inch and the dryer 800 lbs. The drying takes about 2½ hours. Machinery is run by four electric motors and steam is used only in the cooking and drying.

The company are capitalized at $50,000 and all stock has been sold locally. Robert Pidgeon, of the Pidgeon Fertilizing Company, Limited, of Windsor, Nova Scotia, is actively associated with the Pacific Guano Company, being a director and manager. William Cross, of the Imperial Trunk and Leather Goods Company, Vancouver, is president, and James Alexander and C. C. Kernahan are directors. The former was a member of the Alexander & Perkins Fertilizer Company of Glasgow, and the latter is with the Soldiers' Civil Re-Establishment. C. H. Devine, organizer of the company, acts as general superintendent and secretary-treasurer. Seven men are employed.

The company intend to add commercial manures and hen and cattle foods to their present list of products. They report that the demands for these greatly exceeds the quantity they are at present able to turn out.

Small Fire at Brandon

Plant of Western Canada Flour Mills Company, Limited, Will Soon be Repaired

An explosion and fire occurred on October 22nd at the Brandon plant of the Western Canada Flour Mills Company, Limited. The company report that newspaper accounts of this were greatly exaggerated, since the loss amounted to only $9,000. The damage is being repaired and the mill should be running again, fully equipped about the first week of November.

Sparling Service—

Designing—One link in the chain of Sparling Service, the designing department typifies all others.

Not one man but several, each of demonstrated ability, shoulder the responsibility of designing your building.

These men plan in co-operation with one another, and in consultation with the engineering, the purchasing, the estimating, and the constructional departments.

This co-operation policy—the planning and consultation of a group of experienced men, all working together under one general management, results in carefulness, economy, control and efficiency that is not obtainable otherwise.

To appreciate the co-operation of each department of Sparling Service with all others—is to appreciate its achievements in the efficient construction of factories and other buildings.

Ask our advice about your building problems

Expansion of Indo-Canadian Trade*

By P. F. SCHARSMIDT

THE fact that in 1917-1918 the total Canadian exports to India were only £50,377, whereas those of the United States were £7,875,854 for the same period is a sufficient commentary on the possibilities of Canadian trade expansion with that country.

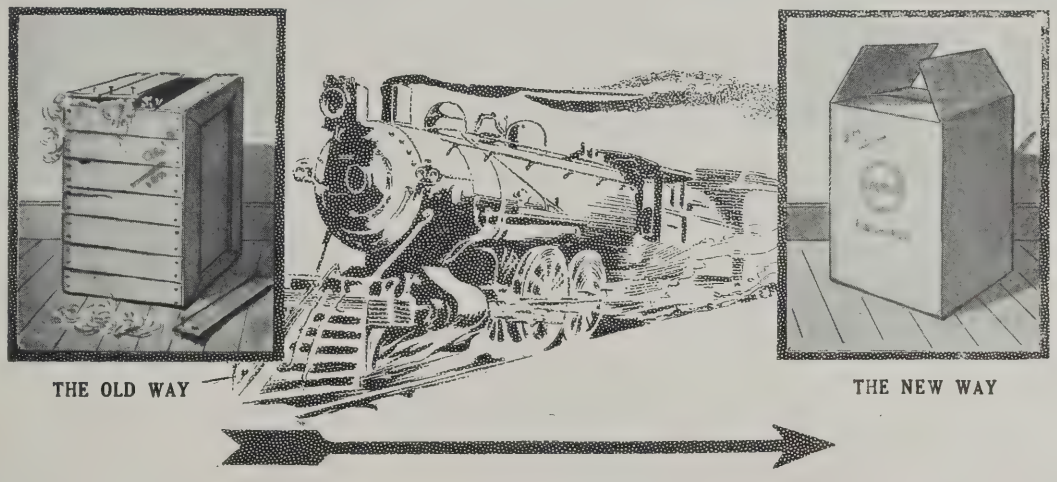
At the outset I must emphasize the primary importance of Canadian manufacturers realizing the extraordinary industrial development now proceeding in India.

During the war India was compelled to make provision for local production of many articles previously imported, and in addition to her own requirements was called upon to furnish vast quantities of war material for other fields of operation, and her then existing factories and industrial plants were developed to an enormous extent. The Government fostered technical education both for their home factories and to supply efficient mechanics and artisans in other zones. Immediately following the war, the Government of India appointed an industrial commission who are still sitting, their object being to encourage to every possible extent the expansion of home industrial development. To this end they are rendering large financial assistance to certain industries, and initiating the actual development of new industries. With the speeding up of production and the agitation of labor leaders for a betterment in labor conditions came a material increase in the wage scale, the earning capacity of the laborer and mechanic in many cases being doubled. This condition has brought about a very marked improvement in the social and economic status of the people, and among them one sees on all sides an awakened ambition for improvement in dress and food and general culture.

With a population of 400,000,000 (including Ceylon) with an energetic and determined Government policy to increase industrialism, and with the speeding power of its people rapidly increasing by wage increments, accompanied by a growing desire for an improved standard of living, one can grasp the vastness of the Indian market and appreciate the immensity of its commercial potentialities and opportunities for trade.

Lack of Knowledge of Canada

In visiting the various centres I was impressed by the lack of knowledge on the part of importers regarding Canada's ability to supply any of their requirements, this being due entirely to the absence of any commercial advertising or trade propaganda by Canadian firms and to the entire absence of any direct steamship connection with Canada at that time.



In discussing trade matters with the various commercial bodies and firms, I was assured of an earnest and sincere desire on the part of importers to confine their orders to the Empire. The United States and Japan are constantly carrying on a very active trade campaign in India, and the result of the activity of the former is an increase in the three years 1914 to 1917 of £4,755,903, or approximately 150 per cent.

The methods adopted by some of the United States firms are as follows:—

1. Manufacturers send capable representatives throughout the country, who carry with them catalogues of an up-to-da

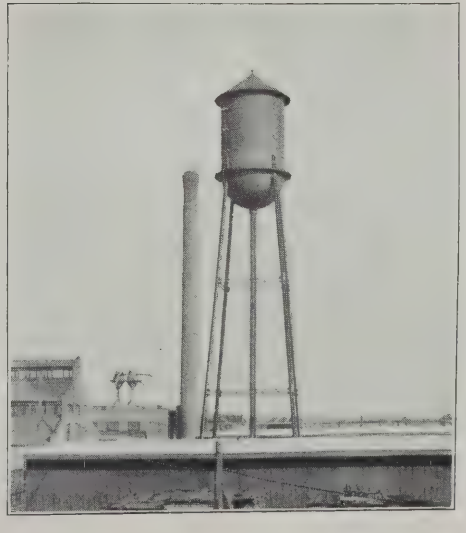
CONTAINERS will save on your transportation charges, save your floor space, cut down packing expenses, and give you positive protection against loss from damage and pilfering. Write for prices and samples.



The Hinde & Dauch Paper Co. of Canada Limited, Toronto, Canada

Steel for Permanence

The All Steel Elevated Water Tank is the most economical installation for Automatic Sprinkler systems for fire protection, general mill supply, or Municipal Water Works systems.

Its first cost is not excessive, the maintenance expense is very low, and there is no danger of leakage, falling ice, or possibility of the tank bursting or catching fire.

Hundreds of our All Steel Elevated Water Tanks now in service throughout Canada bear witness to these facts.

OUR PRODUCT IS MADE IN CANADA

Printers' and Bookbinders' Supplies

educational character and as far as possible a line of samples. As a result of their investigation various firms are approached with a view to establishing an agency; this being effected an exclusive agency agreement covering a specified period is entered into whereby the United States principals supply the agent with a full line of samples and in many cases small consignments are also supplied, the agency in most cases paying advertising costs.

2. As a result of preliminary investigation, branch houses of the American firms are established, carrying full lines of their products in demand. This plan is largely adopted in connection with machinery of all kinds, including tools and small hardwares, iron and steel products, provisions and oilmen's stores, druggists' sundries and specialties, office fixtures and specialties.

3. The introduction of United States goods by firms availing themselves of the selling organization of various export and distributing agencies with established connections in the Orient.

In the large trade centres such as Calcutta, Bombay, Madras, Rangoon, and Ceylon are various old established firms of highest reputation and strong financial ability, who carry on indent businesses. They employ native brokers who accept orders from the bazaars (that is the native retailer) on a percentage basis, but in turn assume the financial responsibility and guarantee account by established credits against shipments. These houses are especially serviceable in connection with smaller specialties.

Packing of Commercial Samples

I cannot impress too strongly the necessity of giving the greatest care to the preparation, packing and shipment of commercial samples. If of an edible nature they should be packed in an outer container of metal hermetically sealed; and confectionery, breakfast foods, cocoas, and dried fruit or vegetables must be invariably packed in air-tight containers, either metal or glass.

The manner of quotations should in all cases be c.i.f. Indian port, and although I am aware that the question of funds is a contentious one, I strongly recommend sterling quotations as far as possible until such time as sufficient information is obtainable in India regarding the relative value of Canadian and New York funds; at the time of my visit but slight and indefinite information on this point could be had and to my knowledge this was detrimental to Canadian trade when quoting against United States prices.

Catalogues Wanted

British Legation at Montevideo Will Place Canadian Catalogues in Information Department

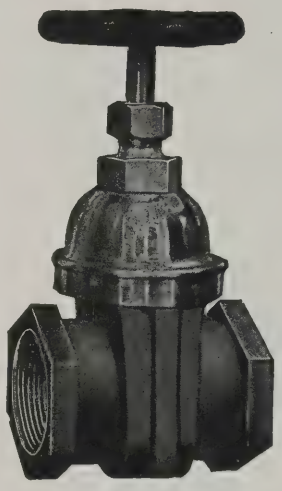
The British Legation and Consulate-General at Montevideo, Uruguay, have opened a special section for trade information. It is proposed to collect all the latest commercial data to have it accessible to the merchants of Uruguay who will be notified through the press of the arrival of the latest catalogues and other commercial publications. The British Minister has very kindly offered to place in this special section the catalogues of Canadian manufacturers. The Canadian catalogues will be classified, and their arrival will be announced to the public of Montevideo free of charge. It is hoped that Canadian manufacturers will avail themselves of this kind offer.

METHYLATED SPIRITS
(Denatured Alcohol)

CANADIAN INDUSTRIAL ALCOHOL COMPANY LIMITED

DURING the last session of parliament, the Inland Revenue Act was amended so that the sale of Methylated Spirits (denatured alcohol) is no longer controlled and carried on by the Department of Inland Revenue.

Our Distillery at Corbyville, Ontario,—the largest Industrial Alcohol plant in the British Empire—is fully equipped and thoroughly organized to serve manufacturers who use Methylated Spirits or Denatured Alcohol.



We will be pleased to place at your disposal the advice of our chemists in regard to the use of specially denatured alcohol. One of these formulas may prove more suitable in your business than that which you are now using.

We also manufacture Ethyl Alcohol, Cologne Spirits, Fusel Oil and Non-Potable Alcohol.

All orders received by us will be given the prompt and careful attention that only an organization such as ours can give.

History of Canadian Nickel Industry*

By G. E. SILVESTER

THE history of the nickel industry in Canada dates from the incorporation, in January, 1886, of The Canadian Copper Company, now The International Nickel Company of Canada, Limited, by S. J. Ritchie, of Akron, Ohio, and some business associates from Cleveland, Ohio.

The original holdings were acquired by Mr. Ritchie in 1885 from prospectors who had been prompted in their search by the exposure of ore in a rock cut at Murray Mine, near Sudbury, during the construction of the Canadian Pacific Railway then recently completed through that district.

The early discoveries were taken up for copper only, the presence of nickel not being suspected; hence the inappropriate name—"The Canadian Copper Company."

In 1888, after a good deal of preliminary investigation, a smelting plant, with one small blast furnace, was designed and built at Copper Cliff, by Dr. E. D. Peters, who had been engaged as manager.

Dr. Peters had stated that a furnace to smelt 100 tons per day would be "enormous and unprecedented," and when asked later if he thought the smelter could be enlarged to treat 300 to 500 tons per day, said it might be done, but such large figures were very bewildering, as no plant in America was treating so much.

It required comparatively little nickel at that time to swamp the entire world's markets, consumption being only about 1,000 tons annually, and it was only with the development of nickel-steel and its adoption for armor-plate by the United States Navy that The Canadian Copper Company began to get on its feet.

In the meantime, from 1890 to 1894, several other nickel companies entered the Sudbury field, operated smelters for varying periods and disappeared, among whom may be mentioned the H. H. Vivian Company (Murray Mine), the Dominion Mineral Company (Blezard Mine) and the Drury Nickel Company (Chicago Mine).

Later in 1900-01 the Great Lakes Copper Company tried out the Anton Gras process at Mount Nickel. In 1900-01 the Nickel-Copper Company of Ontario, also, with plants at Worthington and Hamilton, attempted to use, first the Hoepfner process and then the Frasch process.

In 1902-03 the Lake Superior Corporation operated a smelter at Gertrude Mine. A number of other companies entered the field, but never reached the stage of active production.

The Canadian Copper Company's operations, however, continued to grow in spite of difficulties and disappointments, financial, metallurgical, mechanical and economic. The original (East) Smelter was enlarged from time to time until there were six furnaces, and further expansion on the original site was practically impossible. Then, in 1899, the West Smelter was built. This was an up-to-date plant, with eight furnaces, but still using the same type of small Hereshoff water-jackets, hand-fed and with hand-pushed matte buggies. Most of the slag had been granulated since 1891.

The first 600 tons of furnace matte made at Copper Cliff was shipped to H. H. Vivian & Company, Swansea, and averaged 39.5 per cent. copper-nickel. Other shipments followed to Vivian & Company, Le Doux & Company, New York; Jos. Wharton, Philadelphia; Tennant & Company, Liverpool; The

—CANADIAN SALES AGENTS FOR—

E. I. DUPONT DE NEMOURS & COMPANY, Incorporated, WILMINGTON, Delaware

Orford Copper Company, Bayonne, N.J., etc., until finally a contract was made with the Orford Company to take all the output.

Heap roasting of the ore was practised from the beginning, the early contracts specifying a maximum of 9 per cent. sulphur. In 1889 experiments were made in the smelting of green, or unroasted, ore, which proved satisfactory.

In the fall of 1891 a Bessemer Converter plant was built, using the old Parrot type of converter. This was operated intermittently during 1892.

Ontario Smelting Works.

In 1900 the Orford Copper Company built the Ontario Smelting Works at Copper Cliff, to further concentrate the blast furnace matte before shipment to the refinery. The furnace matte was crushed, ground in ball-mills, oxidized in Brown straight-line reverbatory calcining furnaces, briquetted and smelted in brick cupola furnaces, giving about a 75 per cent. matte.

When the first smelter was built in 1888, three mines were in operation; namely, Copper Cliff, Evans and Stobie. These continued to supply the major part of the ore requirements, until about 1899. No. 2 Mine was opened up in 1898 and Frood, or No. 3 Mine, in 1900, several other deposits, such as McArthur, No. 1, No. 4, No. 5 and No. 6, having been opened up and abandoned in the meantime.

In 1901 the construction of the Manitoulin and North Shore Railway (now the Algoma Eastern Railway) from Sudbury to Gertrude Mine provided an opportunity to develop Creighton Mine, which soon proved to be a very extensive ore-body.

This brings us to the formation, in 1902, of The International Nickel Company, which combined with certain other interests, the Canadian Copper Company, operating mines and smelter; and the Orford Copper Company, operating the refinery. The former company, however, retained its name and identity until its amalgamation with The International Nickel Company of Canada, Limited, in 1918.

The inception of the new organization, in 1902, marked the beginning of a period of rapid development made possible by an ample supply of capital. The first step was the construction of a modern smelting plant on a new site, employing large units, with everything possible operated mechanically. The Ontario Smelting Works was superseded by a Bessemer Converter plant adjoining the blast furnaces, using the latest type of acid copper converters. The most advanced mechanical practice was followed throughout; for example, the use of alternating current for the operation of cranes and converters.

This plant was blown in on July 20th, 1904. The first installation consisted of two blast furnaces, 50 by 204 inches, and three acid converter stands. Steam power was used at the smelter until the construction of the High Falls Hydro-Electric Plant, which was put into service in February, 1906, a thirty-mile transmission line having been completed to Copper Cliff, with branches to Creighton Mine and the newly opened Crean Hill Mine. Since that time everything at mines and smelter has been operated electrically, except railway transportation.

Expansion Since 1904.

The present smelter, since it began operations in 1904, has experienced a practically continuous programme of expansion and evolution to provide for increased production requirements and changes and improvements in smelting practice.

The two blast furnaces have increased to eight, five of

these being of the original length, one a quarter longer, and two a half longer.

The three acid converter stands became ten and then were shortly afterwards replaced by large basic converters of modified Peirce-Smith type, 37 by 10 feet. The first of these was blown in in March, 1911. There are now six in service.

To take care of the flue dust and excess ore fines a Reverbatory Plant was built in 1911, with two furnaces, 19 by 112 feet, using pulverized coal for fuel. This was the first reverbatory installation of this kind, and has since been widely copied in copper practice.

The reverbatory plant includes four Wedge mechanical roasting furnaces, with ball-mills for fine grinding.

The Roast Yards, which at one time formed three angles of a triangle surrounding Copper Cliff, much to the discomfort of the inhabitants, but which later were confined to one location about a mile from the town, were finally moved, in 1916, to a new site about nine miles west of Copper Cliff. Unloading and bedding of raw, or green ore, and reloading of roast ore, both of which operations were formerly done by hand, are now carried out mechanically, the latter by steam shovel (for some years past), and the former by the electrically operated travelling ore-bridge installed in 1919, which did away with the last of the company's large manual operations.

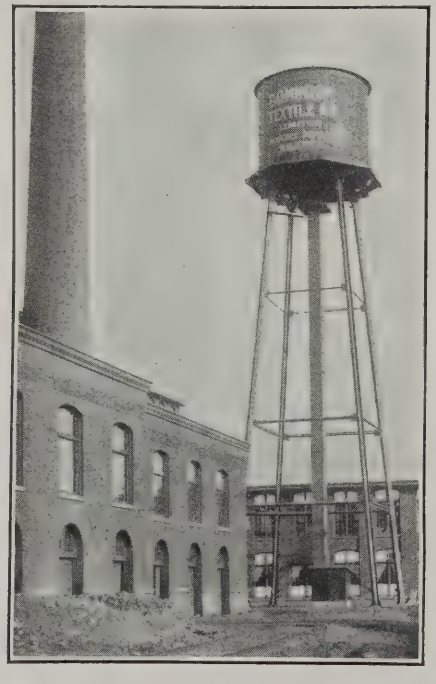
Experimentation and research work are being continually carried on, and have resulted in many improvements in practice, as well as numerous failures. Among the latter may be mentioned repeated attempts at different times and by different metallurgists to accomplish pyritic smelting, which, if successful, would do away with heap roasting.

With the exception of the sporadic operations referred to above, the Canadian Copper Company was the sole smelter of nickel ores in the Sudbury district till the advent of the Mond Nickel Company, who began to produce, in 1901, at Victoria Mines. Their new smelter at Coniston was completed in 1913.

The only other company to enter the field since 1901 is the British-American Nickel Company, whose smelter at Nickelton and refinery at Deschenes, Quebec, began operations early this year.

Some idea of the growth and importance of the nickel industry in Ontario may be gathered from the following figures taken from Ontario Bureau of Mines reports:

SUDBURY DISTRICT.



Ore Smelted—	1890	59,329	Tons
" "	1900	211,960	"
" "	1910	628,947	"
" "	1918	1,559,892	"

Oatmeal Mill Burned

Tillsonburg Plant of the Canadian Cereal and Flour Mills, Limited, Destroyed by Fire

On October 14th the Tillsonburg plant of the Canadian Cereal & Flour Mills, Limited, was destroyed by fire. This plant was used by the company for the manufacture of rolled oats and oatmeal, and the company have since been securing these products in sufficient quantities to meet their present contracts and provide for possible requirements of their customers.

The company report that grain and stock carried 100 per cent. insurance, and building and plant 90 per cent. co-insurance. The exact loss cannot be determined until a meeting with the insurance adjusters has taken place. At present plans for rebuilding the plant are not formulated, as they are largely dependent on the company's success in securing a plant or plants for immediate operation.

F. Magee	F. Magee, Limited	Port Elgin, N.S.
Thos. Roden	Roden Bros., Limited	Toronto, Ont.

That American capital is coming into Canada at the rate of two hundred million a year is the estimate made in official circles at Ottawa. This money is going, not into industry alone, but into Canadian securities, federal, provincial, municipal, and railway as well. According to an authoritative statement made in Ottawa recently, out of the two hundred and seventy-five millions invested in the Canadian pulp and paper industry, now in process of great expansion, about eighty per cent. is American. A recent financial statement issued in New York placed at five hundred and twenty-four millions the amount of Canadian loans in the United States exclusive of the amount in Canadian war bonds. The rate of exchange at the present time is all in favor of United States capital being invested in Canada whilst it is working against the influx of British capital.

The annual logging payroll of British Columbia is $12,500,000; that of sawmills $9,750,000, of logging railroads $1,750,000, and of paper mills over $3,000,000. Other wood-working industries bring the grand total to $121,000,000 which payroll is distributed among 100,000 employees, making an average payment of $100 per month for all workers in mills and logging plants. The forestry payroll is about 25 per cent. of the total payroll of the industries in the province.

The Coalmont Collieries, Ltd., have recently opened a mine near Coalmont, B.C., and on the completion of an aerial railway of two and a half miles, will commence shipping to Vancouver for the domestic market. They are now producing 150 to 200 tons per day, but before the winter will have a production of 1,000 tons.

A second cable from the mainland to Vancouver Island is to be laid immediately by the British Columbia Telephone Company, according to announcement. The cost will be $350,000.

W. D. Rock has left England for British Columbia, having organized interests in the British Isles to undertake the establishment of an iron and steel industry at Vancouver

ROUND STEEL WELDED TANKS
Top End Open

Made any gauge iron up to ¼-inch plate, welded throughout, making them like a one-piece tank, therefore cannot leak. Formerly these tanks were riveted and, as they were made of black iron, they could not be soldered and were therefore very liable to leak, in fact the lighter tanks could not be made leak-proof, but the new welding process has changed all this and we can now give you a tank that we can guarantee absolutely. We specialize on heavy tanks for manufacturers, finished round top with heavy angle steel if so desired.

SQUARE WELDED STEEL TANKS

Made any size or shape to suit. Being welded throughout they are just like one piece of tank, and there is no chance of leakage as with the riveted tank. We can supply these up to ¼-inch plate. We finish them around top if desired with heavy angle steel and the larger ones with extra cross and upright braces. Can supply any necessary Pipe Fittings.

Also Air Pressure and Gasoline Tanks

An Analysis of the Income Tax

(*Continued from page* 73.)

would have to be assessed against farm lands and the effect of such assessment ought to be considered with the utmost care.

"(*b*) By a graduated personal income tax."

A levy of this kind already is being collected by the Dominion Government under the Income War Tax Act, 1917, with rates which are higher than those in the United States and are satisfactory to the Council. The limitations upon revenue from this source, under the conditions obtaining in Canada, have been shown.

"(*c*) By a graduated inheritance tax on large estates."

All the Canadian Provinces already are collecting heavy succession duties or inheritance taxes, and encroachments by the Federal authorities upon this revenue source as well as upon the income tax field, would be opposed and resented by the provincial administrations. Moreover, the consequence of taxing inheritances at higher rates than those in force in other countries and, particularly, in the United States must be considered, especially at a time when Canada needs new capital to assist in its development. Again, experience in Great Britain and elsewhere has been that to an increasing extent insurance is taken out to protect against succession duties and that the inheritance tax tends to become in effect an additional income tax.

"(*d*) By a graduated income tax on the profits of corporations."

Such a tax is being collected under the Income War Tax Act and the Business Profits War Tax Act with rates higher than those in the United States.

It will be seen that the only new taxes proposed by the Council are the inheritance tax, which already is levied by the provinces, and a Federal land tax, the larger part of which would have to be borne by the agriculturists.

Imperial Oil, Limited, have purchased the plant of the Well Tool & Iron Works, Limited, at Calgary, Alta. It will be used by them for manufacturing and repairing tools and machinery used in their operations in the Canadian West.

A change has been announced in the firm of E. T. Wright & Company, Inc., manufacturers of the "Just Wright" brand of boots and shoes at St. Thomas, Ontario. Henceforth the firm will be known as the Talbot Shoe Company. Officers of the company are E. E. Donovan, president; E. W. Wright, vice-president; and J. A. Sullivan, secretary-treasurer.

Ralph Gilchrist, of Detroit and Alpena, was elected president of the Dominion Sugar Company, Limited, by the directors of the company at a meeting held in Chatham, Ontario, on October 22nd, to succeed the late Henry B. Smith, of Bay City. Mr. Gilchrist is interested in many industrial concerns in Canada and the United States.

The Pulse of Business in Canada

Banking Statistics

Large Increases Taking Place in Current and Call Loans in Canada and Elsewhere

The position of the chartered banks at the first of September showed heavy increases in current loans, loans to municipalities and call loans, with substantial increases in deposits. The figures were as follows:—

	Aug. 31, 1919	July 31, 1920	Aug. 31, 1920.
Deposits on demand ..	$584,300,855	$639,415,025	$640,361,707
Deposits after notice..	1,196,632,931	1,253,170,443	1,261,647,732
Current loans in Canada	1,011,785,424	1,377,276,853	1,385,470,163
Current loans elsewhere	146,964,315	190,914,052	200,945,241
Loans to municipalities	57,536,867	78,792,822	79,912,041
Call loans in Canada..	95,899,836	115,360,894	113,598,923
Call loans elsewhere....	174,176,578	203,045,209	193,888,245
Circulation	223,454,556	240,833,686	237,697,647

Bank Clearings

Returns for September Indicate Dominion-wide Expansion in this Department

An increase of $184,000,764 in bank clearings was recorded for the month of September, this increase being spread pretty generally all over the Dominion. Both Montreal and Toronto reported large gains, while Ottawa was the only city to show any serious decrease. Following are the figures as compiled by the *Monetary Times*:—

	Sept., 1920.	Sept., 1919.		Changes.
Montreal	$556,543,834	$498,925,811	+	$57,618,023
Toronto	414,156,433	358,890,250	+	55,266,183
Winnipeg	245,983,823	218,769,121	+	27,214,703
Vancouver	77,437,078	59,519,366	+	17,917,71[1]
Ottawa	35,473,726	42,194,407	—	6,720,68[1]
Calgary	36,447,175	30,522,676	+	5,924,49[9]
Hamilton	31,836,176	26,588,243	+	5,247,93[3]
Quebec	30,648,095	25,182,030	+	5,466,06
Edmonton	22,715,293	21,543,119	+	1,172,17[4]
Halifax	22,421,025	19,811,960	+	2,609,06

Trade Returns

Latest Figures Show Increase in Imports and Decrease in Exports of Domestic Products

An increase in imports and a decrease in exports featured the Department of Customs' summary of Canadian trade for the month of September. Under the heading of imports, the increase applied to all classifications with the exception of animals and animal products. Under exports, the decrease was principally confined to miscellaneous products. With the exception of fibres, textiles and textile products and

New Filtering System

Designed to treat cutting oils, permitting of their use a and again on tools

A new filtering and sterilizing system for the trea of cutting oils and similar lubricants has been design S. F. Bowser Company, Limited, Toronto, and will shor placed on the market. The system is so designed that be adapted to prevailing conditions. From the machine chip separators the oil, either by gravity or special pro can be delivered to the filter and sterilizer and this matically removes foreign matter and sterilizes the After going through a series of compartments, screens, ing devices, etc., the liquid is delivered to the filter which acts as a temporary storage. From this tank, can be returned to the different machines the same a oil and used again.

Filtering System for Cutting Oils

The advantage of the system lies in the increase the cutting tools, the decrease in power consump higher operating speed, the increased accuracy and servation of the oil, a better grade of oil being While the filtering process is under way, the oi sterilized, thus eliminating obnoxious odors and p infection, thereby preserving the health of employe

Book Reviews

Valuable Year Book

The Canadian Annual Review of Public Affairs. By J. C Hopkins, F.S.S., F.R.G.S., 1919. Toronto: The Can Annual Review, Limited, 1920.

It is now nineteen years since Mr. Hopkins bega publication of this valuable work, which with the pa years has grown both in bulk and importance. As l marks in the preface to the current volume, what wou the feelings of the archivists, students and journalists day, if they suddenly came across nineteen volumes similar work covering the first nineteen years of th ceding century. That would indeed be a find. But such is impossible, for there was no one in those days wit vision and the painstaking industry to set down curren penings in almost every department of national activi the benefit of succeeding generations.

The Canadian Annual Review, it might be explain those unfamiliar with its style and purpose, seeks t forth in readable form the events and developments previous year. It covers a wide area. In the 1919 v will be found whole sections devoted to a record of ha ings connected with and following after the Great Wa to Canada's relations with the Empire and foreign cou It is Mr. Hopkins' belief that Canada entered the twe century with a pending and inevitable evolution into E and world politics, and accordingly he devotes consid space to these developments.

The growth of the farmers' movement in politics— the most significant signs of the times—is carefull lined, with references to the origin and history of the ment in previous years. Considerable space is given progress of manufacturing and to the work of the Ca Manufacturers Association. Attention is also devo developments in the field of organized labor. The rev is thoroughly done, with a minuteness of detail and tion to accuracy, that is most commendable. Nor volume simply a dry record, as most works of re usually are. It has the quality of readableness and recommended as a very entertaining book to peruse.

Standard Specifications

C. E. S. A. Standard Specification for Steel Railway Canadian Engineering Standards Association: Sept., 1920.

This work enjoys the distinction of being the init lication of the Canadian Engineering Standards Ass This organization, which was incorporated last year, the main committee of which the Canadian Manuf Association is represented by three members, has at object the standardizing of specifications in engineeri tice, a work in which it is closely associated with th Engineering Standards Association. The present which is a well-printed book of 79 pages, has been i explained in the preface, with a view to giving to t designer, detailer and manufacturer, guidance along

lines, thus leading to uniformity in the provisions to be made for strength and utility. Begun some years ago by the Canadian Society of Civil Engineers, the work of compilation was continued by the Engineering Institute of Canada and completed by the Canadian Engineering Standards Association. The specifications made, while not in absolute agreement with those of the American Railroad Engineering Association, are yet in substantial agreement therewith. The book is well arranged, very complete in its details and excellently indexed.

Vocational Training

Retraining Canada's Disabled Soldiers. By Walter E. Segsworth, M.E., Formerly Director of Vocational Training, Department of Soldiers' Civil Re-establishment. Ottawa: The King's Printer, 1920.

A good deal has been written about vocational training for returned men, but this is the first time that a complete account has been given of the work as carried out in Canada. Mr. Segsworth, of course, is admirably qualified to deal with the subject by reason of his official connection with the administration of the Department and he enters into details which would not be available to the average writer. Mr. Segsworth was appointed Director of Vocational Training in July, 1917. He held the office for nearly two years, retiring to resume his practice as a mining engineer in March, 1919. It was during his time that the system of training was worked out and placed on an effective basis.

The arrangement of the book follows the logical course, opening with a chapter explaining the principles employed and then giving an account of the history and growth of the work and its present organization. Next, commencing with ward occupation, which marks the beginning of training, the curative workshops are described; special attention is given to the subject of interviewing the men determine their natural bent, with an account of the in trial re-training as undertaken in factories. The me aspects of the case are dealt with and a special chapte devoted to the care of the blind, while the whole wor summed up in three chapters, giving an array of statis costs and results.

The interest of the book is enhanced by the introduc of a number of illustrations, which give a very clear ide the nature of the training, and there is a brief forewor Sir James Lougheed, Minister in charge of the Departme

Roof Flashing Handbook

The Barrett Company, Limited, Give Details and S fications in Newly-Published Catalogue

The Barrett Company, Limited, have just brought o booklet descriptive of the standard flashings now manu tured by them. The company claim that this new line satisfactorily fulfil every requirement, whether with b or concrete construction. Ample provision for contrac and expansion, watertight joints, close adherence to roo wall, easy and practical installation, adaptability and erate cost are some of the essential features claimed them. As all these advantages cannot be guaranteed if blocks and flashings are improperly installed, architects, tractors and engineers would do well to make a careful st of the specifications contained in the Barrett Company's b It is very complete in this respect and is well illustrated w blue prints and photographs.

Ocean Shipping News

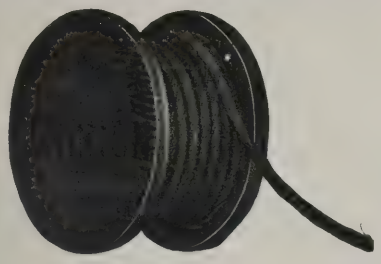
New C. G. M. M. Services

Agreements Formed With Two Other Shipping Companies for Services to India and the Orient

Each month finds the Canadian Government Mercha Marine, Limited, developing some new trade route as n ships are placed in commission, so that in a very short ti C.G.M.M. ships will be carrying Canadian commerce in eve trade route in the world.

In addition to regular services now operated from M treal to Great Britain (Liverpool, London, Glasgow, Swans and Cardiff)—Barbadoes, Trinidad and Demarara—Santia Cuba, and Kingston, Jamaica—Brazil and River Platte, a from Vancouver, B.C., to Australia and New Zealand, the lowing new services have been arranged:

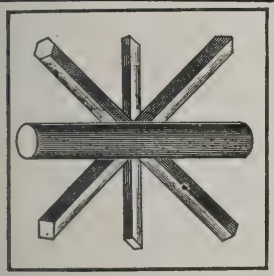
In conjunction with the British India Steam Navigati Company a service has been arranged to India via Mediterranean and Suez Canal route; S.S. *Boyne* leavi Montreal on October 30th for Karachee, Bombay, Colom Madras, Rangoon, Calcutta, Singapore, Batavia, and Soerba S.S. *Canadian Pioneer* inaugurated this service, havi sailed from Montreal on September 7th last.



A very important agreement has been reached betwe the old established Alfred Holt Line and the C.G.M.M. connection with service from Pacific Coast to the Ori whereby each line will have an equal number of ships service running alternately. This gives the advantage to C.G.M.M. of the old established trade relations of the H Line in the Orient to develop their trade, while it gives the Holt Line the advantage of the Canadian National-Gra Trunk Rys. in connection with their service. The C.G.M. sailings in connection with this service to China and Jap will probably commence from Vancouver about the end the year; service to India commencing from Vancouver ab the same time. C.G.M.M. sailings in each service will monthly thereafter.

A new passenger and freight service will also be inaug ated some time early in January from Halifax to Beli British Honduras, calling at Nassau in the Bahamas, a Kingston, Jamaica. The ships which will be commissio for this service are now under construction and nearing c pletion and are being fitted with excellent passenger acc modation for about thirty passengers. All the staterooms being situated on the bridge deck, and being outside roo the very best of ventilation will be afforded. The round t to Belize will make an ideal winter tour occupying about weeks. This being the only passenger service from a Ca dian port to these points should prove of great benefit be well patronized.

Addition to C.G.M.M. Fleet



'Canadian Rover" was Launched Last Month by Collingwood Shipbuilding Co.

On October 19, the new steel steamer *Canadian Rover* successfully launched at the yards of the Collingwood Sh building Co. The christening ceremony was performed Mrs. H. B. Smith, wife of H. B. Smith, President of the S building Co. She was presented with a suitable souveni the company through the manager, J. S. Leitch. The *Ca dian Rover* is the seventh steamer built in these yards part of the Mercantile programme of the Dominion Gov ment. It is of full canal size, and is built to the high classification of Lloyds. The steamer is well advanced, will go into use in a few weeks.

Commercial Intelligence Service

Several Changes Announced in the Personnel of the Trade Commissioners

A number of changes have occurred recently in the Trade Commissioner Service of the Dominion. J. Vernon Mackenzie has resigned as Trade Commissioner in Glasgow and has returned to Canada to become the editor of *Maclean's* Magazine. He has been succeeded at Glasgow by Major L. B. Johnson, who has been Trade Commissioner in Brazil. The Brazilian position goes to Major E. L. McColl, who has been taking a course of training in the Department at Ottawa as Junior Trade Commissioner.

W. McL. Clarke, Canadian Trade Commissioner, Milan, Italy, is at present visiting Canada. He is now preparing reports on those countries have been published in the Weekly remembered that Mr. Clarke visited Spain and Greece, and his report on those countries have been published in the Weekly Bulletin of the Department.

Deaths Among Prominent Manufacturers

Francis H. Whitton

Vice-President and General Manager of the Steel Co. of Canada, Passes Away

A valued member of the Executive Council of the Association passed away on October 24th in the person of Francis H. Whitton, vice-president and general manager of the Steel Co. of Canada, Limited, Hamilton. Mr. Whitton was born in England 61 years ago, and came to Canada as a young man. For many years he was associated with J. Orr Callaghan in the Ontario Tack Co. When this company was taken over by the Steel Co. of Canada, Mr. Whitton's fine organizing ability was recognized and he rose rapidly to the position he occupied at the time of his death.

Erskine Henry Bronson

Pioneer Lumberman and Parliamentarian Dies in Ottawa After Long Illness

Hon. Erskine Henry Bronson, a pioneer lumberman and one of Ottawa's leading citizens, died early on the morning of October 19th, at the age of 76. Mr. Bronson's death followed an illness of eighteen months' duration resulting from a stroke of paralysis which he suffered while spending a holiday in California last year.

Hon. Mr. Bronson, says the *Ottawa Evening Journal*, took a deep interest in everything pertaining to the welfare and development of the Capital. He was always deeply interested in educational and civic affairs, and lent his time and recognized ability to the Public School Board and City Council for nearly a score of years. His loss will be sincerely mourned by a wide circle in business, civic, church and university circles.

He was president of the Bronson Co., Water Powers and Manufacturers of Ground Wood Pulp, 150 Middle Street, also president of the Ottawa Improvement Co., vice-president of the Ottawa Light, Heat and Power Co., president of the Ottawa Power Co., and director of the Ottawa Electric Co.

Mr. Bronson was born in Bolton, Warren Co., New York, on September 12, 1844, the son of the late Henry Franklin and Editha (Pierce) Bronson. He received his education at the Grammar School, Ottawa, and Hudson's Falls, New York. When a youth he joined the Bronson and Weston Lumber Co., and acquired an interest in that company in 1867. On the death of his father he succeeded him as president of the Bronson and Weston Lumber Co. in 1889.

He was one of the founders of the Ottawa Electric Company, and was elected a member of the Ontario Legislature for Ottawa, holding office from 1886 to 1898. He joined the Mowat Government as Minister without portfolio on Sept. 10, 1890, and held a similar position in the Hardy Government.

In 1882 he contested County of Carleton in Liberal interest. Just prior to nomination day his opponents considered it necessary to withdraw their candidate and run the Premier—Sir John A. Macdonald—against him. In spite of this fact he saved his deposit, which was a notable achievement in this constituency.

"He stands for all that is desirable and attractive in the public man," was the eulogy of the Ottawa press.

In 1874, he married Ella H. Webster, daughter of the late Prof. N. B. Webster, of Norfolk, Va.

Ship "National!"

THE ships and rails of the "National" services offer Canadians a splendid opportunity for the expansion of business in the Dominion and beyond its boundaries to all the ports of the Seven Seas.

The rails of Canadian National Railways serve practically every important point in Canada and reach direct all of the great ports. The publicly-owned, "Nationally" operated vessels of the Canadian Government Merchant Marine Limited sail from Canada regularly to the chief ports in the Old Land, the West Indies, Cuba, South America, Australia, New Zealand, India, Straits Settlements and Java.

Cana n National Railways

He is survived by his wife, one son, Mr. Fred Bronson, and one daughter, Mrs. R. A. A. Johnston, both of Ottawa; two brothers, Mr. W. J. and Mr. F. P. Bronson; a sister, Mrs. Levi Crannell, also four grandchildren, Erskine B. Johnston, Robert B. Johnston, Edith Johnston and Genevieve Bronson, all of Ottawa.

Thomas Long

Founder of the Northern Navigation Company Dies at His Home in Toronto

The death occurred in Toronto on Sunday, October 11th, of Thomas Long, founder of the Northern Navigation Company and president for many years of it and of the Collingwood Shipbuilding Company, Limited. He was also a director of several other organizations, including the Merchants' Bank, the Toronto General Trusts Corporation, the London & Canadian Loan & Agency Company, the Excelsior Life Company, and the Consumers' Gas Company of Toronto.

Mr. Long was a Conservative in politics and represented North Simcoe in the Legislative Assembly of Ontario from 1875 to 1883. His services on behalf of the Church of Rome were rewarded by the Pope, who conferred on him knighthood in the Order of St. Gregory the Great. Besides his widow, a son, T. P. Long of Collingwood and two daughters, Mrs. Howard Wheeler of St. Paul, Minn., and Mrs. D'Arcy McGee of Ottawa, survive.

Charles Ernest Warwick

Secretary-Treasurer of Warwick Bros. & Rutter Dies in Toronto, Aged Fifty-four Years

Charles Ernest Warwick, secretary-treasurer of the firm of Warwick Bros. & Rutter, died at his home, 428 Walmer Road, Toronto, on October 14th, after an illness of about two years.

Mr. Warwick had been associated with the large stationery and publishing business with which his name was identified for over a quarter of a century, growing up with it from early manhood. Born in Woodstock, Ont., fifty-four years ago, he came to Toronto when a lad and received his education at Upper Canada College.

He took a great interest in Zetland Lodge, A.F. and A.M., was a member of the National Club and the Ontario Jockey Club, and a Conservative in politics. In religion he was an Anglican and a member of Grace Church-on-the-Hill.

He is survived by Mrs. Warwick, three sons, W., W. M. and S. M., and one daughter, Miss Helen.

Welding Locomotive Fireboxes

L'Air Liquide Society Issue Booklet of Information on Oxy-Acetylene Process

L'Air Liquide Society, manufacturers of oxygen acetylene, welding and cutting apparatus, etc., whose head office is at West Toronto, have just issued a booklet entitled "Welding Locomotive Fireboxes by the Oxy-Acetylene Process," which is intended to supply a long felt want. The information contained in it is gathered from the experiences of George L. Walker and R. T. Peabody, of the Air Production Engineering Service Department, New York, both of whom are experts on their subject.

The facts given are of a purely practical nature and are intended to serve those persons who use the oxy-acetylene process for welding locomotive fireboxes, or for similar work. The company state that they have a limited supply of these booklets on hand, and, on request, will be pleased to send a copy to any reader of INDUSTRIAL CANADA to whom it would be of benefit and practical interest.

ELDER DEMPSTER LINES

Canada-South Africa Direct Service

Regular monthly sailings from Montreal in Summer and St. John, N.B., in Winter, calling at Cape Town, Algoa Bay (Port Elizabeth), East London, Port Natal (Durban) and Delagoa Bay in the order named.

Canada-West Africa Direct Service

From Montreal in Summer, and from St. John, N.B., in Winter, monthly sailings for Dakar, Sierra Leone, Seccondee, Accra and Lagos, and other ports on the coast, if sufficient inducement offers.

Barrett Specification 20-Year Bonded Roof on Ste. Philomene School, Montreal, P.Q. Arch.: Vautrin & Bernier, Montreal. Gen'l Cont.: Ulric Boileau, Montreal. Roofer: J. E Hardy.

The Modern School and its Roof—

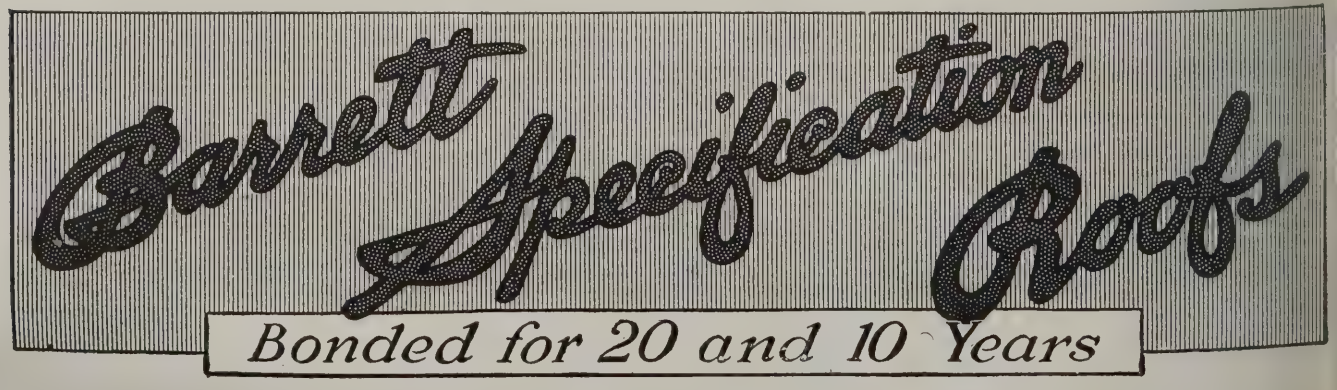
STE. PHILOMENE SCHOOL, at Rosemont, Montreal, which is shown in the accompanying illustration, was designed for convenience and safety, and built for economy and permanence.

It is a typical example of the splendid modern school buildings that are found to-day in all the larger Canadian cities. And, like many such buildings, it is covered with a Barrett Specification Roof, laid under the supervision of our inspectors and guaranteed against all repair expense for 20 years by a surety company bond.

This bond may be obtained on any Barrett Specification Roof of 50 squares or larger, in any city of 25,000 or more and in smaller places where our inspection service is available.

Our only conditions are that the roofing contractor shall be approved by us and that The Barrett Specification, *revised April 15, 1920,* shall be strictly followed.

Important Notice



The Barrett Specification Type "AA" 20-Year Bonded Roof represents the most permanent roof-covering it is possible to construct, and while we bond it for 20 years only, we can name many roofs of this type that have been in service for more than forty years and are still in good condition.

Where the character of the building does not justify a roof of such extreme length of service, we recommend the Barrett Specification Type "A" Roof bonded for 10 years. Both roofs are built of the same high-grade materials, the only difference being in the quantity used.

Full details regarding the Bonded Roofs and copies of The Barrett Specification free on request.

Editorial Comment

evising the United States Tariff

ACCORDING to an item appearing in the *Daily News Record* of New York, the work of collecting iterial for a new tariff bill for the United States has en completed and a copy of the report is being sent each member of Congress. The report, which covers ery known existing tariff, covers 1,005 pages. A de margin is left on each page and members are quested to write suggestions opposite the schedules which they are interested.

The *News Record* adds this significant statement: t is understood that the present plan is to revise ractically the entire schedule upward, as President-ect Harding is committed to such a bill for the pro-tion of American industries." In the face of such intimation, it is folly for Canadians to talk of ducing the Canadian tariff.

---

he Earnings of Terminal Elevators

In a recent issue of the *Farmer's Advocate and Home Journal*, Winnipeg, attention was directed by W. J. Christie to the earnings of terminal elevators isdisclosed in an audit made by Price, Waterhouse & Co. The audit, which covered the five years up to August 31, 1917, showed that the terminal elevators ade enormous profits on their invested capital during ach of the five years of the audit. During the year ded August 31, 1917, eight companies made net profits on the working capital ranging from 173 per cent. to 498 per cent. Of these, it is interesting to note, the United Grain Growers, Limited, the elevator company operated by the farmers' co-operative organization, are reported to have made a net profit of 217 per cent. on capital invested.

The purport of Mr. Christie's article was to protest against the high scale of charges fixed by the Board of Grain Commissioners for Canada, and particularly the action taken in 1919 in raising the rates for the present year. He reports having attended the last three meetings of the Board held in Winnipeg to fix the tariff, and says that at each meeting the terminal elevators asked that their rates be increased. Evidently it is quite a different proposition for a terminal elevator company to make a profit of 217 per cent. on capital invested than it is for, say, a textile manufacturing company to make a profit of a small fraction of this amount.

Spreading the Gospel of Good Times

THERE is no doubt that there is a tendency towards pessimism in the business world at the present time. This and that supposedly unfavorable circumstance is seized upon as an indication that we are in for a period of depression, and there is a great deal of loose talk about slackening business, reduced production and unemployment. Of course, all this is injurious, and the infection should not be allowed to spread. There are enough favorable factors in the situation to more than offset the unfavorable ones, and it should be the duty of everyone to stress what tends to build up instead of magnifying what exerts an opposite effect.

The example of at least one Canadian manufacturing company deserves commendation. This is the Office Specialty Mfg. Co., Limited, Newmarket. This company have started the publication of what they call a "Good Times" bulletin, in which they have collected together a lot of information and advice calculated to spread the gospel of good times throughout their organization. As they point out in a letter issued in connection with the first number:

"Canada's industrial power, revealed through concrete performance, is now an actuality—a force that has awakened the national consciousness to future possibilities of trade development. What Canada has done during the past six years has been not only a

matter of pride to Canadians, but a revelation to the world of trade and commerce.

"Our optimism is founded, then, on known capacity, plus bountiful resources with the realization that the accomplishments of the past are but the fore-runners of the greater expansion that is assured if we will but apply the energy that distinguished our efforts when the great occasion demanded it.

"We believe earnestly in the philosophy we preach —and we are firm in the faith that if we will all work industriously—the man in the factory to produce more goods, the salesman on the road to sell more goods, and the men and women in our offices to help along the work of these two—we shall not only have reaped our reward in prosperity, but at the same time achieved industrial stability through a gradual process of re-adjustment."

This is sound commonsense advice, and is applicable to every business in Canada. If all were to carry out the ideas contained in this letter, there would be no question about the ability of this country to make good.

U. S. Manufacturers in Canada

ENTERPRISE of a commendable kind is displayed by the Statistical Department of the Union Bank of Canada when it issues a booklet on Canada calculated to induce United States manufacturers to build plants in the Dominion. The booklet, which is entitled, "A Canadian Plant—Why?" puts the case very concisely and pointedly, giving useful information and statistics as to Canadian trade with the United States, her trade relations with the British Empire and how the preferential tariff is an advantage to the manufacturer in Canada. Labor, power and coal supply are discussed and attention is given to banking and transportation. In short, the booklet is an excellent primer on the subject and should awake interest.

"To-day the American manufacturer who has business in Canada *must* establish himself in Canada to hold that business," declares the writer of the booklet. "The instinct of financial self-preservation is forcing Canada to do all in her power to curtail purchases in the United States and to make within her own borders those things which her people need. Only in this way may she hope to rehabilitate her credit in the United States and to reduce the volume of her war debt. Canadians plainly see the logic of the situation, and the Made-in-Canada movement is daily gathering strength in the Dominion.

"In this task of making herself self-sustaining, Canada is being helped by the course of events. Canada is now an exporting nation of importance and this development is making it increasingly possible for Canadian manufacturers to produce commodities in quantities and bring down their initial costs. The inevitable outcome, of course, will be greater ability the Canadian manufacturer to hold domestic mark against outside competition. This will mean less b ing in the United States as time goes on."

Farm and Shop are Interdependent

WHEN the *Vancouver Province* declared in recent issue that "The more farmers there a in the country, the better market there is for oth producers; the more other producers, the better mar for the farmer," it said a wise thing. Canada nee more farmers and needs them badly, but we are sur not going to get them by driving other producers o of the country. The two must go forward hand hand.

"The main difference between prairie grain growe and other farmers," explains the *Province,* "is th the former have an external market and most of t others produce for the home consumer. Grain growe sell to industrial workers as well as the others do, b the artisans who buy from them dwell in Euro They would not be worse off if workers in Europe w consume their products were to move to Canada a set up shops here.

"Because industries of all kinds have been bu up in the United States, only a small fraction of t cereals produced in that country are now sent abroa Seventy years ago Horace Greeley taught that it wou be good economy for the people of the United Stat to consume their wheat at home, feeding local artisa who work up native raw material, instead of payi the heavy cost of sending the food to Europe to fe artisans there, and then paying the cost of bringi their products to America, leaving American raw m terial undeveloped. What he recommended has co to pass and the United States people are now ma facturing for others as well as themselves.

"What should be the margin of protection in Canadian tariff is a question of detail. All we s here is that the increase of manufacturing in Cana and in the number of artisans and other non-agric tural workers does not hurt the farmer, but does h good. If we had in British Columbia ten times s many artisans, miners, fishermen, lumbermen a transportation and commercial workers, there wo be far better opportunity for the men on the land

---

Welfare Work in British Industry

WHILE a good deal of welfare work is be carried on in Canadian industrial plants, o attempt has as yet been made to correlate program or to establish a central bureau of information a advice. Manufacturers who have introduced welf schemes have acted largely on their own initiative a

ve made such plans as they conceived best suited their own requirements.

It may be of interest to note that in Great Britain lfare work has been definitely organized through e formation of an Industrial Welfare Society, sup-rted by the contributions of a considerable number the leading industries of the country. H.R.H., the ıke of York, is president of the Society, and has en taking an active interest in its work. Sir Wil-m Beardmore, Bt., of W. Beardmore & Co., Limited, its chairman. The council is comprised of a long list notable figures in the realm of British industry. e Society has been in existence for about two years d has attained a membership of 536. Its work up the present time has been largely along the lines propaganda, though a great deal of service has been ıdered to individual firms.

A glance over the annual report for 1920 discloses me of the lines of work that have been taken up. iite recently an organizer of women's work was pointed. The women's department made an exten-re survey of three areas, visiting factories where men and girls are employed, interviewing directors d frequently, at their request, going over the fac-ies with a view to making suggestions relating to lfare. Ninety firms were visited in the six months ce the department was organized.

In the general department, no fewer than 3,000 its have been paid to individual firms, and as a re-t a large number of definite schemes of welfare rk have been started. Supervisors have been ap-nted in several factories, and in others welfare emes have been started either under the head of firm or under a member of the staff or by means works committee. It is the opinion of the Society t, in smaller firms particularly, welfare work will the near future depend for its inception and execu-n upon works committees.

So far as publicity is concerned, the press of Great tain has given loyal support to the work of the ciety, and a large number of articles have been tten and published on the subject of welfare. Wide licity has also been given by means of addresses lectures, and a long list of organizations is pub-sed in the report of the Society, which were dressed by the director or members of the staff.

In the other hand there have come to the Society m many quarters requests for schemes applicable specific trades and circumstances, and in every ance helpful information has been supplied. These mes covered the planning of welfare buildings, ion schemes and benefit societies, educational mes, equipment of club rooms and gymnasia, for-on of sports' clubs, apprenticeship schemes, safety schemes, works lectures and works magazines.

he Society has been instrumental in securing rail-concessions in favor of juvenile camping and lay parties, and has arranged a series of Saturday afternoon visits to places of interest for such workers as are not attracted by or are unable to take part in vigorous games. Arrangements were also made for a summer camp for boys and girls and for a week-end holiday home outside London.

All this is very effective work, for it not only encourages the introduction of welfare schemes, but makes them part of a general movement. As the report states—"There is a growing tendency for supervisors to look to a central office for carrying out the work of administration connected with many of the activities to which reference has been made, and the Council feel that this tendency is greatly to be encouraged, since it leads not only to unity in policy, but to efficiency in execution."

Public Ownership in Canada

IN its Bulletin No. 15, the Citizens' Research Institute of Canada estimates that the citizens of Canada have now an investment of approximately $1,000,000,000 in publicly-owned and operated enterprises. This figure it regards as a conservative estimate. Of the total, $670,000,000 represents the Dominion Government's investment in railways, steamship lines, grain elevators and telegraph lines. This sum will be considerably augmented when the purchase of the Grand Trunk Railway system is completed.

Through the various provincial governments, the investment in public service enterprises runs to about $124,000,000, distributed as follows:

Province.	Enterprise.	Amount Invested.	Total.
British Columbia...	None	None.	None.
Alberta.....	Telephones	$11,394,589	$11,394,589
Saskatchewan.....	Telephones	7,857,385	7,857,385
Manitoba.....	Telephones	11,047,473	
	Elevators	1,195,385	12,242,858
Ontario.....	Hydro-Electric	62,000,000	
	Railways	22,334,918	84,334,918
Quebec.....	None	None.	None.
Nova Scotia.....	None	None.	None.
New Brunswick....	Railways	8,193,855	8,193,855
Prince Edward Is...	None	None.	None.

The investment through municipal governments works out at approximately $215,000,000, of which $120,508,090 is in water works; $63,559,318 in electric light and power; $17,900,935 in street railways, and $12,740,481 in miscellaneous enterprises.

The bulletin sounds a note of warning with regard to public ownership. It points out that "underlying the administration of any and all business enterprises are certain sound business principles. These principles hold, irrespective of the ownership. When citizens, in their governmental capacities, go into commercial business they operate under the same immutable laws of administrative efficiency. If they ignore them, the results are certain and inescapable, but, inasmuch as governments are not persons, but governing corporative collections of persons, they can pass the loss on to the citizens through their taxing

power. But this only prolongs the day of reckoning. There are limits even to the taxing power. That limit is, on one side, the paying ability of the citizens and, on the other, the degree of ease with which citizens can transfer their interests to other communities where the burdens of taxation are not so heavy.

"The best safeguard of public ownership is a frank recognition of the fact that a government possesses no magic wand which can reverse administrative principles or change deficits into surpluses by a gesture. There are certain well-defined monopolies which, in the nature of things, must be operated by the civic or other government. There are certain other undertakings partaking of the nature of a monopoly which should be operated by the public if the public can effect the proper machinery for their administration. There are others which may be operated by the public to its own advantage if the public are sufficiently wide awake, disinterested and pertinacious to compel the observance of sound principles of administration."

Strong Arguments for Protection

UNDER the heading "Canadian Money May Go Lower," the *Calgary Herald* recently published an article devoted to a demonstration of the desirability of encouraging home industry, which contained certain facts and figures worthy of careful consideration. On the question of exchange with the United States, it was pointed out that there could be no permanent betterment until imports were drastically curtailed and exports increased to the largest possible amount. Five points were emphasized. Canadians ought—

1. To buy Canadian-made products in preference to goods of non-Canadian origin, patronize Canadian railways, Canadian insurance companies, Canadian shipping, and, generally, to keep Canadian money in Canada;

2. To limit imports to absolutely necessary commodities;

3. To develop Canadian natural resources so as to make this country economically self-sufficient to the greatest possible extent;

4. To stimulate investment of Canadian and imported capital in industries which will help to relieve Canada of the necessity of importing on so large a scale as at present, and to provide a surplus of Canadian products for export; and

5. To encourage the final processes of manufacture in this country so as to save payment to foreign labor and foreign capital for manufacturing goods which could advantageously be made in Canada from Canadian raw materials by Canadian workers.

A considerable section of the article dealt with western industrial development and showed how extensive of late years has been the growth of manufacturing in the West. Figures were quoted from the Public Service Monthly of Alberta, and from the Dominion Bureau of Statistics to illustrate this growth. Two hundred and eight factories, employing 3,171 people, are reported by the Government of Alberta in that province. As for development in Saskatchewan the Public Service Monthly issued at Regina, notes the following recent developments:

Organization under provincial incorporation of the Ceylon Sodium Sulphate Company, Limited, to develop the sodium sulphate deposit south of Ceylon, Saskatchewan. It is claimed that the sodium sulphate secured in this district can be used without any refining process; tests 98 per cent. pure, and is considered the most valuable deposit in the world. Nine million tons are said to be available without much expense. The known mineral resources of Saskatchewan include natural gas, sodium sulphate, sodium chloride, salts and potash, coal, clay, gold, and petroleum. In connection with development of the natural resources of Saskatchewan, the development of which is being encouraged by the Provincial Bureau of Labor and Industries, two samples of clay, one taken from the East End and one from Wood Mountain, have been forwarded to England for exhibition purposes. Samples of pottery manufactured from this clay have also been included in the shipment. The Saskatchewan Co-operative Creameries, Limited, is adding to its big plant in Regina. When complete this will be one of the largest and most modern butter making plants in the Dominion. A very fine shale has been discovered at Lumsden, Sask., which can be pressed and manufactured into fancy bricks. Experiments indicate that this is a first-class material for manufacturing pressed face brick, tile, and sewer pipes.

The article winds up with certain comments on the farmers' policy. After quoting Mr. Norman Lambert to the effect that what the farmers' organization wants is tariff reduction, not tariff commissions, it proceeds:

"If Mr. Lambert's statement is to be taken literally the farmers' organizations are prepared to insist upon reductions in the tariff without considering the effect on Canadian industry, especially in view of present world economic conditions. If their demand is for tariff reduction without investigation, they are showing no consideration for Canadian labor or for any element in the community except the producers of agricultural products for which there is a world market. To oppose the appointment of a permanent tariff board on the ground that 'we have had at least two tariff commissions at work in this country during the past thirty years which accomplished nothing,' is an evasion of the issue.

"In the United States a permanent Tariff Board is accomplishing splendid results, the great value of which is frankly recognized by both of the principal parties. The Commission is accumulating a tremendous amount of valuable information relative to costs

f production, etc., in the United States and abroad, nd is laying the basis of a scientific revision of the ariff. By failing to have a Tariff Board, Canada is agging behind her southern neighbor and is leaving he tariff issue to be determined by opportunism and ectional bias, without information as to the true eeds of Canadian industry and without reference to he possibility of development of Canada's resources nd the promotion of national economic independence.

"Much of the criticism directed against capitalists s prejudiced and ill-informed. The idea that the wners of capital represent only a comparatively small art of the population is disproved by a recent report ssued by the Controller of Currency of the United tates, which shows that in the national banks of the nited States there are no less than 20,380,000 time and emand deposit accounts. The demand deposit accounts epresent 12,315,000, and the time deposits 8,065,000. his represents an average of approximately one bank ccount for every five and a half of the population, r almost one bank account for every family. These gures take no account of the very large deposits in tate banks and trust companies. Besides this evi- nce of ownership, of capital distributed to a remark- le extent over the entire population, there are some- ting like 20,000,000 owners of Liberty Bonds, and sides many millions of people who own bonds, stocks, ortgages, and other securities which are nothing ore or less than titles to wealth. It may safely be id that there are comparatively few adults in Canada ad the United States who are not capitalists either rge or small."

he Canadian Traffic League

WORK of a very valuable character is being carried on in quite an unobtrusive way by the Canadian Traffic League. This organization, to which an article is devoted in this issue of INDUSTRIAL CANADA, was formed some four years ago. It has had a consider- ale growth since its inception, and its membership is to be found in several of the larger cities of the country. To readers of INDUSTRIAL CANADA, its main interest lies in the close connection which exists be- tween the Traffic League and the Canadian Manufac- turers Association. In a sense it is an off-shoot of the latter, and, while quite distinct so far as organization is concerned, it is yet doing work that is of immediate value to the C.M.A.

The objects of the League are clearly set forth in th article. They are entirely commendable. Any- thing that can be done to make our transportation system more efficient is clearly a national economy redounding to the good of the whole community, and it is with this end in view that the Canadian Traffic League has been organized and is carrying on its cam- paign of education.

It is gratifying to know that the railway companies are in complete accord with the programme of the League, and are co-operating with it towards the general improvement of transportation methods. There is here no conflict of interests, and what is good for the traffic manager is good for the railway com- pany. This relationship has been recognized at various meetings of the League, where representatives of the railways have been present and have fully endorsed what the League stands for.

Up-to-date Publicity

RECENTLY a Canadian, interested in collecting lantern slides, wrote to a bureau in New York for two supposedly up-to-date views of Toronto. One of these was designated, the corner of King and Yonge Streets. On examination it was found that the pic- ture was at least thirty years old. It actually ex- hibited horse cars plying on the streets.

A somewhat similar instance of backwardness occurs in the October, 1920, issue of the *International Trade Developer* of Chicago. On the cover appears a large half-tone showing "King Street, looking east from Yonge Street, Toronto, Canada." This view is also sadly behind the times. There are electric cars in sight, but not a semblance of an automobile or a sky- scraper.

Perhaps to the rest of the world, these may be small matters, but, if they are typical of the way in which Canada is being represented, or misrepresented, abroad, is it not about time that something was done to check up these things?

Those Government Departments in charge of our national publicity might very well add to their func- tions that of supplying such bureaux and publications as we have mentioned with up-to-date photographs, so that no false impression will get about.

We appreciate the kindly reference to this publica- tion in the September issue of the *Empire Mail*. The *Mail* said:—"INDUSTRIAL CANADA, the monthly official publication of the Canadian Manufacturers Associa- tion, is an excellent journal devoted to industrial developments in the Dominion. The remarkable ex- pansion of manufacturing activity, due to the war, is being maintained by the wide-awake firms of Canada who are now organizing with the object of securing a share in the oversea markets of the world. Their interests are well served by this journal, which con- tains a mass of most useful information, and the well- written and illustrated articles are valuable propa- ganda for Canada products." On our part we would like to pay tribute to the valuable service being rendered by the *Empire Mail* in promoting inter- Empire trade. Its issues are all attractively prepared, and contain much material of interest to the business men of Canada and the other Dominions of the Empire.

Synopsis of Proceedings Before the Tarif Commission in Eastern Canada

THE NOVEMBER HEARINGS

Based on the Official Report

This is the third series of reports of the hearings held by the Special Committee of the Dominion Cabinet appointed to receive representations with regard to the Canadian customs tariff. As the work of the Commission is of vital importance to Canadian manufacturing industry, we are presenting as full a report as possible of the proceedings, our account being a condensation of the official stenographic report.

AFTER an interval lasting from October 18 to November 4, the Tariff Commission resumed their inquiry into conditions surrounding the incidence of the customs tariff in Canada, at Charlottetown, P.E.I., continuing their travels through the Maritime Provinces and later entering Quebec and Ontario. The story of the inquiry is taken up again at Charlottetown, where the following matters were discussed:

CHARLOTTETOWN

Nov. 4.—The commission met in the chamber of the Legislative Assembly at 10 a.m. The first witness was Hon. J. H. Bell, Premier of Prince Edward Island. After welcoming the commissioners to the Island, Mr. Bell pointed out that agriculture and the fisheries were their chief industries, there being very few manufactures such as were found in Nova Scotia and the other provinces of the Dominion.

"We believe that the commission will be desirous of stimulating greater agricultural production," said Mr. Bell. "We think that stimulus given to greater agricultural production is consistent with the desire for an increased revenue. The one is the result of the other because greater agricultural production means greater wealth and greater wealth means greater purchasing power. It means greater purchases of goods that are dutiable. More than that, it means greater wealth on which income taxes and other taxes can be levied. By producing greater wealth we will produce greater revenue."

Agricultural Production

Hon. Walter M. Lea, Commissioner of Agriculture, emphasized the desirability of securing the greatest amount of production from the natural resources of wealth in the province. The present agricultural production amounted to between $25,000,000 and $30,000,000 yearly, as nearly as it could be estimated. He believed that by more intensive and better cultivation production could be increased by 50 to 100 per cent.

Due to the prevalence of mixed farming, a greater variety of implements were used than in any other province of the Dominion. On his own farm twenty-eight different implements were in use. If the duties on these were so high as, in some instances, to restrict their use, it meant great restriction to production.

The soil of the Island was lacking in lime. Those in the vicinity of a river bed could use shell mud as a corrector. Those not within reach of this article had to bring it by rail, and the rate was as high as on the higher grades of commercial fertilizer. The same rate applied to lime rock costing $1.50 a ton as to fertilizer costing $90 a ton, and its use was restricted on that account. The policy was adopted of importing limestone crushers and bringing in the stone by water from the Nova Scotia quarries. There was a duty of 27½ per cent. on the crushers and this was a very great handicap to those who would like to purchase the machines.

"We all realize the necessity of encouraging our home manufactures," said Mr. Lea, "and as citizens we would rather purchase from our own people, but when the duty is so high that it restricts the use of goods, or prevents the purchase of goods, or compels the purchase of goods made in this country, the result is that the Government gets no benefit from the tax."

Old Argument Advanced

Sir Henry Drayton questioned this statement and asked Mr. Lea to explain. The latter used the old argument that the duty on the imported article went to the Government, while the equivalent on the home manufactured article went to the manufacturer. Sir Henry suggested that there was an income tax on Canadian manufacturers. Mr. Lea admitted that the Government got the benefit of the income tax, but not of the duty. Sir Henry then mentioned the duty paid by the manufacturers on raw materials, and again Mr. Lea admitted that this would have some effect. At the same time he claimed that with high duties manufacturers could make and sell poor implements; whereas if duty were reduced so that a grea number of machines could be import the home manufacturer would be sti lated to make better machines. Mr. instanced gasoline engines, on which duty was about 27½ per cent. or wards of $100.

The Potato Industry

Mr. Lea next referred to the deve ment of potato-growing, in which a la number of Island farmers were specializing. The potato crop added the wealth of the country and gave railways large revenue, both from ha ing in fertilizer and hauling out potat The soil responded readily to treatm with acid phosphate, but on this th was a duty of 10 per cent., which stricted its use, with the result that so many potatoes were grown as mi have been. By making it easier to fertilizer more potatoes would be gro and the wealth of the country increas

"We would submit," concluded Lea, "that a lowering of the duties agricultural implements, the admiss of fertilizers altogether free, and lowering of the duty on such things limestone crushers, would have a v beneficial effect upon agricultural duction in this province."

Duty on Crushers

Referring to the duty on limest crushers, Sir Henry Drayton asked Lea what he thought would be a rea able rate. Mr. Lea thought that sibly 50 per cent. of the present rate about 13½ per cent., would be rea able.

In reply to questions, he estim that there were about 12,000 farmers tivating farms of from ten acres up, of a population of 96,000. He did know how many fishermen there w He stated that he was unable to a very close estimate of the volum agricultural implements purchased year. He could not tell how much Government was getting out of the t on farm implements, but was prep to supply a list of the cost of ir ments.

Mr. Lea was next asked if he tho the income tax was the proper way the farmer to contribute. He re that he thought a tax on whol transactions was one of the fa taxes. This led to an argument the prices of sugar and potatoes. peating his question as to what wa

best way of getting revenue from the farmer, Sir Henry endeavored to get Mr. Lea to admit that the farmers were properly paying through the tariff. "We are properly paying in this country," said Mr. Lea.

City Versus Country

W. A. Macgregor said that, in endeavoring to cultivate a farm in a small way, he found that he was not able to hold his own with the people in the towns and cities. Labor seemed to be going away. Young people were leaving the farms. Farmers were unable to pay the wages being paid by the manufacturing centres, due, he believed, to some extent because the manufacturers were protected, while farmers had to sell in the open market. This year they lost eight cents a pound on cheese because they were unable to get to the British market.

Mr. Macgregor was questioned as to the products of his farm and particularly with regard to the marketing of potatoes. He did not know the amount of potatoes shipped from the island, but said that the best market last year was in Boston. The Boston price was around $2.00 a bag; that in Toronto $1.25. Possibly part of the difference was due to the exchange. He did not know the number of carloads of potatoes shipped to Canadian markets, but claimed that if they did not have an outlet outside Canada they would have at very much lower price in Canada.

Mr. Macgregor stated that spraying machines, which he had bought across the line at the same price as the Canadian machines, were very much more effective and stood up to the work very much better. He claimed that the Canadian machines cost $30 a year for repairs. He gave details of prices paid for Canadian and American machines. Questioned, he stated that the machines were community machines, serving between forty and fifty farmers. He was asked whether or not the duties collected on imported machines amounted to a cent a bag, but could not say

The witness was next asked a long series of questions as to the extent and value of the products of his farm, just, as Sir Henry Drayton said, "to see what a 200-acre farm on Prince Edward Island, run by a good farmer like yourself, does." He was also queried as to the cost of the implements bought and from whom they had been purchased.

Dealing with taxation, Mr. Macgregor said he thought that farmers should pay their fair share. His own income was around $5,000, but he had not been notified of any tax.

"Do you know how many farmers paid income tax in this great agricultural province?" asked Sir Henry Drayton.

"I do not know," replied Mr. Macgregor.

"Three," said Sir Henry.

"That does not look good to me," admitted Mr. Macgregor.

Sir Henry said it was a situation that had to be met in some way. Here was an industry making over $30,000,000 a year and all that it was contributing in the way of direct taxation was $135 for the whole of last year. Mr. Macgregor thought that, if the duty was not prohibitive, the Government could get more. He was asked what was a prohibitive duty? To this he replied that, if a machine was made in Canada and in the United States, and if they were compelled, on account of the duty, to take an inferior machine, then the duty in that case would be prohibitive to them. He admitted that he did not now consider a difference of $30 between a Canadian and American spraying machine as prohibitive. On being questioned it was found that a machine on which $30 duty had been paid had been used in the production of a crop of 24,000 bushels of potatoes, the machine being admittedly still as good as new.

The Connecting Link

The Car Ferry "Prince Edward Island" which plies between the Mainland and the Island Province

United Farmers' Statement

J. A. Dewar, M.L.A., president of the United Farmers of Prince Edward Island, presented a statement on behalf of the organization. He first drew the attention of the commission to the fact that Prince Edward Island was more exclusively and more completely an agricultural province than any other province in Canada. In 1915 only 1,923 people, or approximately 2 per cent., were engaged in manufacturing. "Only by a very generous stretch of the imagination could it be suggested that any important percentage whatever of the industries were developed by the assistance of the protective tariff, or, in fact, derived any assistance from the protective tariff whatever." Further, manufacturing industries were declining. There was no single advantage that the protective system had brought to the province. Consequently it must be concluded that the protective system had not aided in the development of the province and was not likely to aid towards manufacturing development in the future any more than in the past.

The population of the Island in 1871 was 94,021; in 1911, 93,728. Between 1901 and 1911 rural population dropped from 83,304 to 78,758. Urban population only increased by fifteen. Production was almost entirely agricultural and markets practically all export. Mr. Dewar here put in a plea for improved railroad service to help market their exportable surplus.

Replying to the argument that protection helped the Island farmers by building up industrial centres on the mainland, Mr. Dewar claimed that excessive freight rates affected them vitally in regard to these nearby markets, the cost of transportation to Sydney and Halifax on potatoes amounting to fully 60 per cent. of the market price of the product. When shipped to American points the cost was 100 per cent.

Mr. Dewar named the principal exports of the Island and the markets in which they were sold, declaring that the products of the Island farms were sold on the markets of the world against all comers, and that consequently there was no home market developed by the protective system which could be of any compensation whatever. On the other hand, he claimed that the protective tariff system was aimed and designed to prohibit or reduce the import of manufactured articles, to enable Canadian manufacturers to charge higher prices than they could otherwise secure. Just to the extent prices were enhanced was their agricultural burden.

Questioned by Sir Henry Drayton, Mr. Dewar stated that his farm consisted of 120 acres, of which ninety were cultivated. He secured about $1,500 gross from it last year. This statement surprised Sir Henry, who pointed out that it was 100 per cent. under Mr. Lea's figure of production.

"I take it from you that agriculture is in such a bad way here that it is going back" queried Sir Henry.

Drying Fish at a Maritime Fish Factory

"No, you cannot take that from me," retorted Mr. Dewar. "We are a prosperous agricultural community."

Price Changes

Mr. Dewar then quoted prices of produce forty years ago and declared they were very low. When dairying was introduced about 1892 a change was produced. He thought they were about holding their own so far as production was concerned, though it was becoming increasingly difficult to obtain help.

On the question of railroad rates, Sir Henry asked what he thought should be the amount of the bonus the rest of the country should give to enable the Prince Edward Island farmer to get lower rates. This seemed to perplex Mr. Dewar. Sir Henry explained that the Island Railway last year cost the country $1,596,049. Mr. Dewar gave an instance of what he regarded as high rates. He did not know what the overhead charges were, but was assured by Sir Henry that they would not amount to a fraction of a cent per ton on freight rates. If there was any way of making cuts, he was sure they would be made.

Buying Implements

Edgar J. Geddings, president of the Central Farmers' Institute, came next and put his case in this fashion:—"We buy so much machinery. The bulk of our machinery is manufactured in Canada. If we bought all our machinery in some other country and paid duty on it, we would be able to raise the revenue probably with a much lower tariff. Under the present tariff the great bulk of the agricultural implements that we buy are manufactured in Canada, and as a result we pay a large amount into the pockets of the manufacturers. If the tariff were lower we would save that much. It is said, and I believe truly, that for every dollar that goes into the revenue, $3 goes into the pockets of the manufacturers."

Sir Henry Drayton asked for particulars, but obtained no direct reply. To his remark that the Government collected in company, bank and business profits taxes last year over $36,000,000, Mr. Geddings replied that the people paid it.

Mr. Geddings stated that his farm consisted of eighty-eight acres, of which sixty-five were under crop. He admitted being fairly successful. He had several implements, but had bought only one, a mower, within the last six years. This mower cost about $100. Assuming that $12 was spent owing to the tariff in six years, he was contributing at the rate of $2 per annum to the Federal Government. He paid no income tax.

Must Look to Other Sources.

At this point Mr. Lea interrupted to point out that due to the fact that they were producing largely agricultural products and that there were no manufactures, they must look to some other source. They were purchasing per capita a great many more dutiable goods than other provinces because the others all manufactured something. They were paying more than they got.

Sir Henry Drayton asked Mr. Lea to consider the war obligations resting on Prince Edward Island. On a per capita basis these amounted to $3,750,000. How would he go about raising that money? To this Mr. Lea replied that it was being raised already automatically through their production of $25,000,000 per annum. That produce was distributed everywhere and the Federal Treasury had the means of taxing it. But, responded Sir Henry, the way of getting taxes was at the source and they were only getting the sum of $135. Mr. Lea countered by saying that the millions of dollars earned went to purchase the necessities of life. The greater the value of their purchases, the greater the taxes directly and indirectly. Sir Henry doubted whether they were paying any more than any other part of the country per capita. The value of their products had increased from $10,000,000 in 1915 to $22,000,000 in 1919.

Income Tax Payments

Dealing further with the income tax, Sir Henry stated that the merchants of Prince Edward Island paid, in 1918, $3,813. In 1918, he added, the business profits tax for the whole country amounted to $32,900,000. Prince Edward Island, on the basis of 100,000 population, paid 15.54 cents per capita, as against an average for the Dominion of $2.25, or 1/14 of the general average. He did not think it was fair to say that they were paying more than their share on what they purchased from their merchants as against what the rest of the people were doing.

Mr. Lea contended that there were no large incomes and no big manufacturing companies on the island; hence it was not fair to make a comparison. Sir Henry replied that he was not considering what they were paying indirectly but what they were paying directly.

Pay Through Merchants

"You said that while the farmer was paying very little, he paid more than other places did," said Sir Henry.

"On dutiable goods," said Mr. Lea.

"On dutiable goods," agreed Sir Henry, "and that this greater purchasing power would be found in the profits of the merchants."

Mr. Lea said that the country was full of a great many small merchants, but Sir Henry drew his attention to the statement of the Farmers' Association that there was not very many merchants. The country purchased a great deal from departmental stores in other provinces, added Mr. Lea, and they had a very large purchasing power that would not be touched by any income tax at all.

Premier Bell interposed to ask how much Prince Edward Island contributed through the tariff. Sir Henry replied that it was a hard thing to get at. The Premier was convinced that on that basis they were contributing more than their

share. Sir Henry assured him that if there was any way of getting at it, they would do it.

P.E.I. Starch Factories.

Hon. Senator McLean presented a statement on behalf of the starch factories of Prince Edward Island. He said there were seven factories on the Island costing from $75,000 to $100,000 and with a capacity of about 2,000 tons per annum. Potato starch was used in the large cotton factories for sizing their yarns and finishing their cottons. It was also largely used by sausage makers, confectioners and others. For many years the starch factories supplied about the only sure market for potatoes in the province.

"Beginning about 1914," said Senator McLean, "the German starch being shut out of the markets and the Holland starch being required at home, starch became scarce, and as a consequence the price went very high. This induced the Japanese to make starch, and since that time they have been making very large quantities each year and have invaded our market, with the result that we are unable to compete with their prices, although we have protection of 1½ cents a pound."

Japanese Competition

The Japs, explained the Senator, have no expensive mills and make starch in a primitive way. They have been offering their products at such prices as have prevented the Prince Edward Island mills from operating. Tapioca flour, a product of the West Indies, was also a strong competitor, as was also sago flour, an East Indian product. Corn starch used to be a competitor, but is no longer bothered them. The other products, however, threatened the utter destruction of the starch business in Prince Edward Island. He believed it a serious question whether the Japanese product should not be entirely prohibited under the circumstances. He suggested that the commission should look into the whole subject.

In reply to a question, Senator McLean said that fifteen or twenty men were employed in the starch factories. The value of the starch varied from $80 to $200 a ton. It was $80 before the war. Output amounted to about 2,000 tons and it took from 240 to 250 bushels of potatoes to make a ton of starch. It was a great help to the farmer when prices were too low to take 300,000 bushels of potatoes from them. They paid the farmers from 40 to 90 cents per hundred pounds. They were not running at present on account of Japanese competition, Japanese starch being delivered at any point in the United States or Canada at less than the potatoes would cost the factories.

J. L. Mackay presented a statement on behalf of the manufacturers of Prince Edward Island. He endorsed the official statement of the C.M.A. presented at Winnipeg on September 14. He then presented statistics showing the extent of manufacturing on the Island, giving the number of establishments, the capital invested, number of employees, salaries and wages paid, cost of materials, and value of products for the years 1900, 1905, 1910, 1916, 1917 and 1918, as taken from the federal census of industry. For 1918 there were 484 establishments, with a capital of $2,896,666; 1,670 employees; $777,067 wages; $3,647,800 materials, and $5,697,667 products. A long list of the products of Prince Edward Island industries was appended.

Relation of Industries

The figures given, explained Mr. Mackay, showed a gradual growth and illustrated the direct relationship in the development of farming and fishing with that of manufacturing, the latter industry in most cases being vitally connected with the former. He then cited, as an instance, the company with which he was associated, Bruce Stewart & Company, Limited. About ten years ago, when power boats began to supersede sailing craft, they were encouraged, under the protection of the tariff, to begin the manufacture of marine gasoline engines. The local demand was somewhat limited, so that quantity production, which would ensure low production cost, could not be secured. However, prices were kept at a minimum by reason of competition with similar firms in New Brunswick and Nova Scotia. It was important that provision should be made for repairs. If changes were made in the tariff which would injure the industry, serious inconvenience to the fishing industry would result.

What was said of the gasoline engine industry applied with equal force to virtually all the industries enumerated, particularly to those which looked to agricultural and fishing sources for their raw material. As regards agriculture, if the industry was to be developed, it should be along the lines of intensive mixed farming. The home market was in that case the best market. This market could only be enlarged by the addition and expansion of manufacturing, the tendency would be to overveloped to a greater degree without a corresponding development of manufacturing, the tendency would be to overload the market, with the result that farm products would sell at lower prices.

A Stationary Population

The population of Prince Edward Island had remained almost stationary for some years, due to emigration of young people to industrial centres of other provinces. Farming and fishing were largely seasonal. One of the chief attractions of the industrial centres was steady employment. It might be good policy for Prince Edward Island to encourage numerous small industries in order to provide employment for labor when it was not needed for farming and fishing. Diversity of industry was practically essential for the growth of industry.

Canadian manufacturers labored under many disadvantages by reason of smaller markets and consequent higher costs. If Canada was to continue its remarkable industrial development, it must be through the expansion of its present industries. Capital for this development would only come if an adequate protective tariff was maintained. In conclusion reference was made to the exchange situation, which would be aggravated were imports encouraged by a lowering of the tariff.

Questioned by Sir Henry Drayton, Mr. Mackay said that the manufacturing interest of the Island was entirely negligible as compared with the agricultural interest and that such manufactures as existed were those which looked after the immediate demands of the farmers and fishermen. Asked whether repair plants would not go on without protection, Mr. Mackay said there would not be sufficient business to enable them to keep going. In his own case about 30 per cent. of the business was repair. He also answered questions about the nature and extent of local industries.

The Session at Sydney, N.S.

Nov. 6.—The Commission met in the court house at 10 a.m. The first witness was Dr. A. S. Kendall, of Sydney, who ran against Sir Charles Tupper in 1896 and was defeated. The whole tenor of Dr. Kendall's remarks was to decry Canadian workmanship, claiming that it was inferior to British or American workmanship. He protested that the National Policy, after eighteen years, had done nothing for Cape Breton.

"When I was running that election in 1896," he declared, "I used to meet scores, if not hundreds, of men from Inverness, Victoria and other remote parts of the country walking home unable to get employment in the mines at 85 cents a day. Conditions in New Glasgow were very bad, the steel works being completely dead. Thus the National Policy up to 1896 left the coal and iron industries of this country dead as a door nail."

Dr. Kendall instanced the wire fencing along the Intercolonial Railway as an evidence of the superiority of British workmanship. The fencing was imported thirty years ago and is still doing duty on all but a few miles. Canadian fencing on the latter, he claimed, was now rotten after six or seven years' use. He gave other instances of wire fencing on farms, where British fencing was still good after many years' use and Canadian fencing was rotten. Reference, along

similar lines, was made to harness, boots, lanterns, caps, underwear, automobiles, clothing, carriages, barrows, the whole tenor of his evidence being the disparagement of the Canadian product in comparison with the imported article. Careless workmanship, he argued, was due to the protection under which the manufacturers were working.

History of Steel Industry

Thomas Cantley, chairman of the Nova Scotia Steel & Coal Co., followed with a careful analysis of the history and position of the coal, iron and steel trade of this section of Canada. First, dealing with the history of the industry, Col. Cantley stated that within a few miles of Sydney could be seen a coal outcrop where coal had been mined 200 years ago and used during the building of the fortification at Louisburg in 1620 and from which the garrison of Louisburg secured their fuel so long as France maintained possession of that fortress.

Ninety-four years ago the General Mining Association of London operated collieries at Sydney Mines in Cape Breton and at Albion Mines, now Stellarton, in Pictou County. Both these properties were taken over by the Nova Scotia Steel & Coal Co. upwards of twenty years ago. In 1883 at New Glasgow was melted the first Siemens-Martin open hearth steel made in Canada. The same company were the first on this continent to work coal commercially and they operated the first retort coke oven. They made the first basic open hearth steel in Canada, installed the first blooming mills and rolled the first bars, sheets, etc. They also made the first railway steel car axles in Canada. They were the first Canadian company to convert native iron ores into steel and to them was due the opening of the Wabana ore deposits.

"Here and here only in Canada," declared Col. Cantley, "is installed powerful hydraulic plants for the production of fluid compressed steel in large volume, which in the shape of naval and marine forgings was supplied and sent overseas during the war period to the British engineers and ordnance establishments, formerly supplied largely by Germany.

Dominion Steel Formed

"By washing and coking experiments at the Ferrona furnaces with coal taken from the Glace Bay districts of Cape Breton, we demonstrated that satisfactory coke could be produced from Cape Breton culm coals, which up to that time had had no adequate market. This led to the formation of the Dominion Steel Corporation with its great development at Sydney.

"During the latter half of 1914 and winter of 1915, these two companies each in their several ways, the one by experimenting and research work which resulted in the production of alloy steel for armour and defensive purposes used in the war areas and the other in the production of toluol, contributed more than any other corporations on this continent to the supply of essential materials required for high explosives."

Dealing with coal, Col. Cantley stated that wages were as high as those paid similar classes of mine labor anywhere and would be higher, increasing the cost of coal three times what it was before the war. He felt that the industry was fully entitled to a higher rate of duty and believed that a specific duty of $1 a ton on all coal would so stimulate production and distribution as to make Canada within ten years independent of all outside sources. He did not mean that by this every ton of coal used in Canada would be produced in the Dominion, but exports would be so increased that there would be a fairer basis of exchange between Canada and the United States. There would be more business for the railways and more business for the farmers in supplying the needs of the farming population.

Newfoundland Ore

As for iron ore, the Nova Scotia industry is now entirely dependent upon Wabana (Nfld.) ore, which is subject to an export tax. Production of Nova Scotia ore ceased in 1911. Col. Cantley pointed out that while Ontario steel plants obtained their ore from a foreign country, Nova Scotia plants get theirs within the Empire. Further, the latter plants used Canadian coal, whereas the Ontario plants used American coal, which was practically duty free. This meant that Nova Scotia miners had no protection whatever. Then there was the question of markets. Nova Scotia plants had to find a market at or west of Montreal, to which heavy freight rates applied, while Ontario plants were not similarly handicapped.

"The establishment of modern iron and steel plants in Nova Scotia and Ontario and their development to a point where they became important factors in the manufacturing life of the Dominion was due very largely to the bounties paid by the Federal treasury from 1896 to 1910," declared Col. Cantley. "But for the development of the iron and steel industry thus fostered, Canada in 1914 would not have been in a position to have supplied from her native furnaces, mills and forges, the steel required for the manufacture of munitions, and a very large section of the manufacturing plants and skilled labor of Canada would have been idle during the whole war period. and but a very small proportion of the great total of $1,200,000,000, representing the export value of munitions shipped from Canada to Europe, would have been produced, with the enormous advantage which flowed back to Canada from that export."

The industry, concluded Col. Cantley, required a substantial amount of protection to meet European competition, where wages and living standards were lower and costs of transportation less. It had also to meet the competition of long-established United States plants, with their enormous home market and their proximity to Canada, plants that were well protected by prohibitive duties. For these and other reasons, enumerated in a memorandum submitted, they appealed for a revised tariff which would provide by way of increased duties and the total abolition of the free list, a substantial amount of protection for the coal, iron and steel industry of Nova Scotia.

A Higher Export Tax

Questioned as to the amount of the export tax on ore from Newfoundland, Col. Cantley said it had been 7½ cents per ton but the Newfoundland Government wanted to make it higher and had suggested as high as a dollar a ton. Their importations ran to about a million tons a year of 50 per cent. ore. On the other hand they shipped over about 35,000 tons of coal in their own operations, while Newfoundland was entirely dependent on Cape Breton for its coal. As to development of Nova Scotia ore, Col. Cantley said that he did not believe that iron ore existed in such commercial quantities that it could be worked to advantage.

Questioned as to the cost of bituminous coal, Col. Cantley said that it ran over $5 a ton and in some cases as high as $6.50. Coal could be laid down at Ontario plants during the last five or seven years for less money than it could be produced in Nova Scotia. Dealing with freight rates, the Colonel stated that water transport to Montreal was impracticable, while he declared that he knew of cases where steel was carried from England to Halifax and thence by rail to the West for less than their rate from New Glasgow to Toronto.

The Steel Co.'s Memorial

A lengthy memorial on behalf of the Nova Scotia Steel & Coal Co. and the Dominion Steel Corporation was handed in by Col. Cantley. It dealt with the duty on pig iron, tracing its history, and contending that the present preferential duty of $1.50 a ton was entirely inadequate and the general duty of $2.50 a ton too low to meet conditions at present existing. As for steel billets, bars, plates, sheets, etc., changes made in the tariff in the last few years have been even less favorable. A series of figures were presented to show this, special emphasis being laid on materials used in farm machinery, etc., which are now on the free list.

Attention was next directed to wages which it was conservatively claimed were about the highest in the world. It was figured that, although wages might remain high for another year or two they might be expected to fall more rapidly in Europe than in America. Productive capacity had been increased in Europe during the war and output would likely be from 30 to 50 per cent. higher than before the war. The exchange situation helped the European producer.

Figures were given to show how the labor cost in producing pig iron, billets and semi-finished products handicapped the Canadian producer in comparison with his Europen competitors.

Regarding materials and supplies, the memorial pointed out the average rate of duty on all dutiable importations was 22½ per cent. for the year ending March 31, 1920, and on both dutiable and free importations, 14.66 per cent. Various nations allowed a rebate of duty on such importations and this gave their exporters an advantage in the Canadian market. Breakage charges were also a factor, all of which tended to handicap Canadian iron and steel manufacturers.

The item of transportation was an important element in the iron and steel business, due largely to the fact that most of the materials to be handled were bulky and had a low weight - unit value. Figures were given to show that freights were lower on shipments from overseas points to Montreal than from Nova Scotia points. In comparison with rates from United States points to Ontario points, the Nova Scotia rates were higher.

The item of interest on capital was higher in a new country than was necessary in older countries and fixed charges were correspondingly heavier.

The memorial suggested that the basis of protection should be not cost-production but the ultimate poor cost. Costs of production not only varied between countries but between industries in a country, whereas labor costs were usually uniform within a country. On this principle, Canada should have greater protection. In relation to the United States, Canada's minimum protection should be as high as that of the United States and greater if she wished to protect her home industry against undue competition from that country. Reference was made to the efforts of foreign countries to effect sales abroad at prices below the cost of production and the question asked, what was to be the measure of protection against the dumping on our markets of foreign products so sold?

"Locked out effectively from the markets of competing nations by high protective tariffs, the Canadian iron and steel manufacturers must have the mainstay of the home market in order to exist. In it he must live or die, and surely he is not over-reaching in expecting that he be given fair play and protected sufficiently to render such unequal competition harmless. We submit the only solution of the difficulty is to put the duty at a sufficiently high figure to attain this end. The duty at present in force is too low to do so."

A. McCall, secretary of the Nova Scotia Steel & Coal Co., spoke in support of the memorial. He declared that the desirability of the establishment and continuation of the steel industry and the allied coal industry was almost universally acknowledged. The greatest assistance ever accorded the trade was that provided under the Fielding tariff of 1897.

"It is an industry that cannot be built up in a day or a year," said Mr. McCall, "and one would be appalled to contemplate what would have happened Canada during the war period had she possessed no basic steel industry." Pre-war production of steel reached a peak of 1,168,000 tons in 1913. Under war pressure, production of steel ingots and castings reached 1,873,000 tons in 1918. This fell back to 1,030,000 tons in 1919. Much capital was needed to establish the industry and special Government assistance was required to induce capital to embark in it. From the time the last reduction in duties and bounties took effect, the industry remained almost at a standstill until the assistance given the Dominion Steel Corporation by the Government led to the establishment of the plate mill at Sydney.

Mr. McCall showed that the protection accorded the steel industry had never been excessive or a detriment to industry generally. The highest duties were in 1887, when $13 a ton was imposed on bars. This duty was reduced to $7 in 1897, where it still remains. Just before the war prices in Canada were very considerably below the American prices, plus the duty. Since then the Canadian purchaser has in many cases been able to secure Canadian steel at lower prices than the American consumer.

According to Government statistics there were in 1917, 1,049 establishments manufacturing iron and steel products in Canada. These had a capitalization of $307,407,980; employed 70,071 hands on wages; paid $68,947,610 in wages; bought materials valued at $204,732,121 and produced goods valued at $400,385,086. The great bulk of the iron and steel industries of Canada existed by fabricating and making into manufactured articles and partially finished steel and iron goods that are imported into this country to the extent of almost two hundred million dollars worth annually. The existing tariff has not operated to restrict the growth of the general iron and steel trade in Canada.

The steel trade has never been accused of making exorbitant profits. The Nova Scotia Steel & Coal Co. has since its inception paid less than 6 per cent. per annum on the money actually invested in its common stock.

As reasons for protection Mr. McCall instanced the desirability of making the country less dependent on foreign countries for its necessities; the importance of adjusting the balance of trade and the importance of encouraging the employment of labor, which in the steel industry represented 80 per cent. of the total cost. The higher cost of mining coal in Eastern Canada as compared with the United States, the higher costs of Canadian mills due to the smaller production, the adverse freight rates on shipments to the West were advanced as further reasons for protection.

Mr. McCall then went on to advocate

A Glimpse of Sydney, N.S.

Headquarters of Important Steel and Coal Industries and the Centre of a Great Industrial District

duties on everything entering into the manufacture of further processes but which constituted a manufacture of their own. He instanced the steel entering into the manufacture of agricultural implements and into springs and axles. The value of such importations amounted to over $25,000,000 last year, all of which might have been produced in Canada. He then went on to picture what a reduction of the present tariff might produce. The basic steel industry represented an investment of $200,000,000. It employed over 18,000 men, to whom $25,000,000 in wages was paid annually. In addition 3,500 men, earning $5,000,000, were engaged in mining coal for the industry. Whatever fate might befall the workers in Ontario should the works close down, no other avenue of employment would be open in Nova Scotia.

Mr. McCall then answered a series of questions showing how a high percentage of the cost of steel production went into labor. He claimed that their protection was relatively low, being just over 10 per cent.

Employment Statistics

Alexander Johnson, Dominion Iron & Steel Co., Limited, furnished some statistics of his company. Wages paid amounted to $5,194,338 in 1918; $5,798,335 in 1919, and $5,651,595 for the first ten months of 1920. There were about 4,000 employees. The Dominion Coal Co.'s pay-roll approximated between $800,000 and $900,000 per month. The company, explained Mr. Johnson, were turning out rails, blooms, billets, plates, wire rods, pig iron, bars, light rails, sulphate of ammonia, sulphuric acid, etc.

A. M. McLennan, president Sydney Board of Trade, gave some information about the city. In 1900, when the steel plant was organized, Sydney had a population of some 4,000. To-day the population was 27,000. Assessment had increased from $1,000,000 to $12,000,000. The city had spent on streets, waterworks and sewers, $2,000,000, and buildings to the value of from $18,000,000 to $20,000,000 had been built. Real estate values had increased by 700 per cent. Farms within a radius of ten or fifteen miles had increased in value from 100 to 500 per cent. Within fifteen miles there was to-day a population of between 80,000 and 100,000 people, 90 per cent. of whom were directly or indirectly dependent on the steel companies' pay rolls. Mr. McLennan testified that this development could not have been accomplished without protection.

Employees Testify

J. C. Mackley, superintendent, Dominion Iron & Steel Co., had lived in Sydney eighteen years. He said he would be very seriously affected if anything were to occur to curtail the company's operations. He did not think it would be possible to compete on an even basis with iron and steel makers in the United States. He regarded it as the duty of the Government to provide measures for the protection of the industry.

Thomas M. Keating, mill man, an employee for twenty years, spoke along similar lines. He had acquired a home of his own and claimed that the continued ownership and maintenance of his home and those of many others similarly situated were dependent entirely upon the successful operation of the steel company.

Bernard Martin, pipe-fitter; John J. Collins, open hearth furnace man; Sherman Green, steel worker, all referred to the favorable working conditions that prevailed, and stated that, as workers, they wanted protection continued so that their work would not be interrupted.

Angus W. Macdonald, superintendent of Department of Industrial Relations, Dominion Coal Co., and Dominion Steel Co., had been for the greater part of 27 years engaged in employing men. He testified to living conditions and wages being greatly improved in that time. He traced the changes of twenty years in this regard, showing how employment had been provided and a market created for farm produce that had totally changed conditions in the farming districts. Sydney had grown from 3,000 to 25,000, and the number of its banks from one to five, with three sub-branches. The city had now a purchasing capacity of $16,000,000 a year. The whole growth was due to the existence and extension of the steel works and the development of the coal mines. Any stoppage or even curtailment of operations at the steel works would be a calamity to Sydney and a wide area around.

Mr. Macdonald told what the company was doing for its employees, and asked for the maintenance or increase of the tariff to enable it to carry out its aims. In answer to questions, he said that from 1,000 to 1,200 men working at the steel plant owned their own homes. Workmen's homes to-day cost from $3,000 to $4,000.

Col. Cantley here stated that fully 60 per cent. of the employees of the Nova Scotia Steel & Coal Co. owned their own homes. The company advanced money at 6 per cent. to help purchasers. There was $700,000 outstanding on this account.

Irving B. Stewart, manager Maritime Bridge Co., New Glasgow, told of the growth of New Glasgow. In the last 40 years New Glasgow and Trenton had grown from 1,500 to 15,000, almost entirely because of the rapid growth of the Nova Scotia Steel Co. He referred to the smaller industries which had sprung up around the larger industry. They needed protection perhaps more than the latter. In the case of his own company, they built railway and highway bridges, tanks, smoke stacks, blast furnaces and odds and ends. Their miscellaneous output was due to the limited market and they could not hope to compete with the specialized American industries without protection.

J. R. K. Bristol filed a statement on behalf of the Cross Fertilizer Co., Limited, Sydney. This statement showed that if protection was withdrawn, the fertilizer industry would be wiped out. Present production in Canada was only about 100,000 tons per annum. The industry, however, was a growing one and capable of tremendous development. The Cross Co. started in 1912, facing strong competition from Great Britain, Belgium and Germany. Sales for 1912 were 6,000 tons. Owing to stoppage of importations caused by the war, trade increased to 35,000 tons and they anticipated making 42,000 tons this season. They had purchased a site in Welland, Ont., where they proposed to erect a plant for the manufacture of chemical fertilizers, provided no interference took place with the present tariff. Protection at present was 5 per cent. under the British preferential tariff and 10 per cent. under the general tariff. The company was a British concern brought here by reason of the tariff.

The Session at Halifax, N.S.

Nov. 8.—The Commission met in the Chamber of the Legislative Assembly at 10 a.m. W. D. Piercey opened with a statement on behalf of the manufacturers of Nova Scotia. He assured the Commission that the manufacturers as a class believed it to be in their interests, in the interests of the workingmen, of the consumers and the nation as a whole, that a policy of protection such as had been in force since 1879 should continue to be the policy followed by the Government of Canada.

He did not believe that the farmers of Nova Scotia favored free trade as apparently some people did in the West, but were fully aware of the immense advantage which a large home market was to them. Further, he urged that the Commission should give due weight and consideration to what other countries and especially the United States, were doing in the way of revising their tariff to give greater protection to home industry. He also pointed out how valuable protection had been in the past in building up industries which had done so much to help win the war.

Figures were then given to show the extent of manufacturing in Nova Scotia. Between 1900 and 1919, the number of establishments had increased from 1,1[illegible] to 2,433; capital from $34,586,416 to $142,734,454; employees from 23,284 to 36,474; output from $23,000,000 to over $100,000,000. In Halifax, the number of establishments had increased from [illegible] to 280; employees from 3,000 to 8,[illegible]

nd value of goods from under 7,000,000 to over $20,000,000. A engthy list of goods made in Nova cotia was supplied.

It was pointed out that times were ever bad in Nova Scotia because hat had diversity of industry, the rovince being endowed with four undamental sources of wealth, amely: the raw materials from the arm, the mine, the forest and the ea. Great possibilities were in store or the province through the develop- ent of these, providing the neces- ry capital could be secured. Capital, owever, would only flow in if an lequate tariff was maintained.

Some Disadvantages

The point was also emphasized at Canadian manufacturers were boring under a disadvantage be- use the later development of their dustries and the smaller market ndered their production costs gher than in older and more popul- s countries. Nova Scotia was fav- ably situated for export trade, but r manufacturers must be assured the home market in order to be e to produce goods cheaply enough meet competition in world mark- . Reference was also made to exchange situation which would rendered more unfavorable were ports to be encouraged. If fac- ies were worth having, because of ployment, markets for farm produce, iness for banks, railways, etc., and enue for municipal, provincial and minion Governments, then adequate tection was the price paid to secure retain them.

H. Brittain, vice-president and eral manager, Maritime Fish Cor- tion, presented a brief on behalf of Atlantic fisheries. These, he said, re at present experiencing what was ome respects the most difficult and ncing situation in their history. Pro- uc on had been greatly stimulated by evar, but when the emergency passed, nsumption in the U.S. and Canada ropped sharply, while European coun- ie on account of the exchange situa- on had curtailed their buying. To-day er was large over-production. Whole- le prices had fallen to the pre-war ve or below, while it cost between two d wo and one-half times as much to tc and land fish as it did before the ar.

The Fishing Industry.

Approximately 47,000 Nova Scotians reengaged in the fishing industry, hol or in part, and 87,000 persons re directly dependent upon the Cana- n fisheries for their livelihood. Many hermen owned their own vessels. To ang their employment was hard. ey were not organized and had few sou es. They were suffering a nui hardship to-day because markets were glutted with fish offered below the actual cost of catching.

A Product of Maritime Province Industry

The Steel Steamer "War Bee," Built at New Glasgow by the Nova Scotia Steel and Coal Co.

Mr. Brittain presented figures covering the operations of three companies producing fresh fish and manufacturing smoked and canned fish. They had a combined investment of $2,312,600, employed close to 700 persons, and last year paid in wages and in payment for fish purchased approximately $2,275,000. A very large proportion of the fish were purchased. These companies provided a market for industries making boxes, containers, cans and other supplies. The companies were not inter-related but operated in keenest competition. There were many other companies carrying on a similar business.

Glutting the Market

Tariff items, in which the fishing companies were principally interested, were next enumerated and it was shown that fishing companies of the United States Atlantic coast were offering fish in Canadian markets at prices which under present conditions netted the fishermen little more than one-half the cost of catching the fish and bringing them to port. The situation, while a temporary one, was demoralizing the Canadian fishing industry and working hardship to the fishermen. It would be even worse were it not for the tariff.

Prices at which fresh fish have been sold to the Canadian consumer at almost any time in the history of the industry were much lower than prices charged for similar fish in the United States. The present measure of tariff protection was needed to stabilize conditions in the industry and reserve the home market largely for Canadian products. The best interests of consumers as well as fishermen would be served by a continuance of the duty.

Have to Move Industry

Speaking only for his own company, Mr. Brittain declared that in the event of free trade there would be no alternative but to go into some other line of business or remove to the United States. Under free trade conditions the companies would be much more favorably located in the United States. Nova Scotia's history was closely connected with the fishing industry and that industry and its products had become distinctive. This distinctiveness would be lost under free trade conditions.

It was pointed out that whole villages and towns in Nova Scotia were dependent on the fisheries, and not only would free trade in fish operate to destroy them, but many other interests would suffer loss—the transportation companies, for instance. From the port of Mulgrave, in 1900, the Canadian Government Railways handled 1,450 tons of fish, valued at $100,000 and charged freights of $16,500; in 1919, they handled 10,256 tons, worth $ 1,332,800 and charged $150,193. There would also be a serious exodus of fishermen under free trade.

So far as canned fish was concerned, the U.S. producers were well protected so that in the event of such fish being

placed on the free list, they could quickly capture the Canadian market. Canada's Atlantic fisheries represented an annual value of between $40,000,000 and $50,000,000. Canadian companies have built up a considerable business in smoked fish, and export trade has enabled them to get quantity production. They have also developed new products. While the immediate export situation was not bright, it would improve, but the home market must be reasonably assured.

Mr. Brittain was asked for details with regard to his statement that the Canadian fisherman got a higher price for his catch than the American fisherman. He said that this was difficult to do because of wide variations, but he undertook to get up some figures on the point. He was also asked for comparative figures of fish prices in Boston and Montreal.

Referring to the way Lunenburg had been built up through its large operations in salt fish, Mr. Brittain contended that other ports could be built up through fresh fish. The fresh fish industry was more important because the fishermen got his money at once. He would combine the two, building up the Canadian market with fresh fish and the export market with dried and salted fish.

Co-Operative Fishing

H. B. Short, of Digby, explained the co-operative system as applied to the fishing industry. He stated that practically all the fishing is done on the co-operative plan as amongst the crew but not as between the companies and the crews. He showed the system as employed in the fresh fish industry at Digby and the salt fish industry at Lunenburg.

Going over the history of the fresh fish industry he said that the industry did not begin to thrive until the duty was raised to a cent a pound following the tariff inquiry of 1907. A large business in fresh fish had been built up with the upper provinces and that trade would be lost were the tariff reduced or removed. He asked for more Government assistance in the way of better transportation facilities, etc. Give the fresh fish people the protection they have and in time they would build up an industry that would be a great national asset.

A. Boutillier, National Fish Co., told of the experiment of sending carloads of fish to Ottawa and selling direct from car to consumer. This system worked at first but it did not last owing to poor service and to the fact that retailers reduced prices. He believed it would be a serious mistake to have the duty removed from fish coming into Canada after so much had been done to build up the industry. There had been a large investment in the business and the consumption of fresh as well as of smoked fish in Upper Canada had increased enormously. Were the duty taken off, all this effort and all the money spent would have been wasted. He referred to the way the Americans had been dumping fish in the Canadian market, and quoted figures to show that they were selling fish for less than it cost Canadian companies to catch them. He also referred to the geographical situation which handicapped them in shipping to Montreal and Toronto and also into the American markets. Raw materials was going down to the United States to be manufactured while, with more encouragement to the industry, it could be manufactured in Canada.

Fisherman's Testimony

William Henneberry, fisherman, Devil's Island, gave information about his fishing operations, and in reply to questions stated that it took an hour and a half usually to salt a quintal of fish and an expenditure of from eighty to ninety cents for salt. The price obtained for fresh fish was about $12.00 a quintal and for salt fish $7.50 a quintal. There were 18 or 19 boats at Devil's Island. The fresh fish business had built up the Devil's Island business 100 per cent. in the last few years. In some years he caught about 100 quintals in six months.

Frank Martin, fisherman, Kitch Harbour, and Walter Brown, fisherman, Herring Cove, gave similar evidence.

A. H. Whitman, president Halifax Board of Trade, spoke on behalf of that body. He quoted a series of figures to show that the larger proportion of Canada's imports came in by rail. In 1919, 81.5 per cent. of imports came from the United States, and in 1920, 75.3 per cent. A reduction in the Dominion general tariff, it was very evident, would tend to increase foreign imports by rail and to correspondingly decrease overseas commerce. During the war exports reached record figures, so that in 1919 the port of Halifax was the world's third most important port. Terminal facilities necessary to enable Halifax to handle a large proportion of world trade had been provided and only required the carrying out of the original plans to fully take care of everything that appeared possible in the way of foreign trade. So long as the customs tariff encouraged and promoted other channels of import trade, the proportion of foreign trade which the seaports should handle would remain disproportionate.

Encourage Ocean Shipping

"In the interests of the Maritime Province seaports and of the other seaports of this Dominion; indeed, in the interests of the whole Dominion and of her carrying trade, her banks, the wholesale trade and the development of domestic industry, we ask that this needed development in overseas trade be fully considered in the arrangement of the forthcoming new customs tariff."

Mr. Whitman also asked for the nego tiation of more trade treaties wit friendly overseas countries and urged th Government to use its influence to g preferential treatment for Canadian pr ducts in the British overseas dominion

Questioned as to the reason for th heavy importation of goods from th United States, Mr. Whitman admitte that a great deal was due to war cond tions, but said that most houses engage in foreign trade were of the opinion tha the general trend of trade was with th Republic.

W. T. Ritcey, president and gener manager of Acadia Gas Engines, Limite stated that the company was started i 1908; had a paid-up capital of $150,00 and a rest account of $35,000. The com pany was engaged in the manufacture marine engines only. Yearly output wa increased from $5,000 in 1908 to $700,00 in 1919. On only four occasions wer dividends paid. Their market extende from coast to coast in Canada and the exported to Australia, New Zealan England, and Newfoundland. They ha about 135 employees, mostly made up local married men, natives of Canad who owned their own homes in Bridg water. The average wage of the machinists was about $1,350 a yea During 1919 they made on an averag about nine marine engines a day, and a output increased, number of employee would increase and the town be corre pondingly benefitted.

Prices About on Par

Competition came principally fro Bridgeport and Hartford, Conn., an though they had to pay a duty of 27½ 30 per cent. on various parts, the pric of their engine in Nova Scotia was abo on a par with the price of similar e gines in Connecticut. They sold to Ne foundland in competition with U. manufacturers and had over 40 per cen of the business. Figures comparing t price of their stationary engines (ma by a subsidiary company) with the pri of similar engines made in the Unit States were submitted, showing that t Canadian engine was cheaper and t Government got the duty on the import parts. Under the present tariff th could retain the major portion of t home market and continue to exte their export business, lowering th overhead expenses. Were existing p tection reduced, American manufactur could undersell them and force them close.

In answer to a question, Mr. Rit said the value of their Newfoundl business was nearly 60 per cent of t total production.

D. N. Eisenhour, managing direc Lunenburg Foundry Co., Limited, that his company started the manu ture of Atlantic gas engines about 1 since when this branch of their busi

ad increased more than 900 per cent. he capital employed was about $40,000; ney employed over thirty hands and paid ages of $37,000 annually. Although a ood many parts of their engines were nported and paid duties, the Atlantic as purchased by Canadian fishermen uch cheaper than similar engines made the United States. He quoted prices prove this. Under present conditions ry few American two-cycle marine gines reached the Canadian markets, t if the tariff was removed, the Ameri- n manufacturer could come in and put em out of business.

Luxury Tax Protested

E. A. Sanders, Secretary Halifax Board Trade, placed before the Commission brief in connection with the luxury x, and asked favorable consideration wards some immediate change in the esent stamp system. Personal evi- nce as to the working out of the system as presented by H. S. Colwell; Henry ahon, Mahon Bros.; George M. Smith, ith Co., and R. A. Wood, Wood Bros. A. H. Whitman, at the request of a mber of Halifax business houses, ced a protest against the continuance the Business Profits War Tax Act.

Miss Smyth appeared before the Com- ssion on behalf of the Nova Scotia rtilizer Co., an unincorporated com- y which commenced operations in lifax in 1878. Their output averaged rly about $250,000, sold entirely in Maritime Provinces. They made thir- different varieties and claimed that r long experience in studying the ial soil needs of the Maritime Prov- es gave their fertilizer a better value h imported fertilizers. Their loca- on the coast gave them the advan- of cheap transportation in bringing tsh from Germany and acid phos- es from Baltimore. They paid ten ent. on importation of phosphate, dhad ten per cent. protection on the ished product. They employed from 130 hands, according to the season. he chief competitor was the American ultural and Chemical Co., of New rk a large concern with immense out- t. Although at present their prices ared favorably with the prices of ir fertilizer in the State of Maine, y did not feel that they could success- ly compete against their American al without the advantage of the pro- tion they now had.

Same Price as Maine

Questioned, Miss Smyth said that acid sphate averaged about one-quarter of ight of the fertilizer, but repre- ted less than one-quarter of the value. was cheaper than fish offal. Their pro- ct sold from $40 to $80, which was ut the same as the price in Maine.

Dr. Cumming, Secretary for Agricul- re of Nova Scotia, and Principal of the Provincial Agricultural College, contended that the duty on acid phosphate should be removed. It was used not only by the manufacturers, but by the farmer, who applied it direct. He stated that a Canadian company now making acid phosphate had told him that it was a very doubtful proposition as to whether the article could be made in Canada profitably any way, and added that their experience with the company had not been satisfactory.

Questioned, Dr. Cumming said that acid phosphate was worth $20 in bulk in Baltimore, while in Nova Scotia it was worth about $40. He also answered questions about other fertilizers, such as basic slag.

H. L. Taggart, President United Farmers of Nova Scotia, presented a statement on behalf of that organization. They believed that the future development of the province depended upon the development of no single industry, but of every industry which the province supported. Their attitude, however, was that the unnatural development of any one industry brought about by tariff legislation or any other public measure, was not in the interests of the all-round development of the province. It was the desire of the farmers to see the largest possible development of manufacturing, provided that this development was not brought about by any legislation or other form of special privilege which wuld give their industry an undue advantage over agriculture.

Slow Agricultural Progress

Although one of the oldest provinces, Nova Scotia had made no great agricultural progress for several decades. Out of a total of 13,483,671 acres, farmers owned 5,260,455, of which 2,000,000 were in woodland, 2,002,906 in pasture land, and 1,257,449 under the plow. Approximately 8,000,000 acres could be cultivated, but less than half of that area had been cleared. Figures were also presented to show that there had been no increase in the areas devoted to cultivated crops in twenty years, and that rural depopulation was continuing. Asking why this stagnation prevailed in agriculture, Mr. Taggart gave as one reason that the farmer operating under present conditions could not afford to pay the wages for labor that the manufacturing centres paid. There were several reasons why manufacturers could pay more, but among them he named the special government privilege of tariff protection.

Mr. Taggart thought there were cases in the early history of industries where some tariff protection was justifiable, and he would still favor a moderate degree of protection wherever he was convinced it was absolutely necessary, but wherever the protection was so high that the industry could earn more money for a given number of hours' work than agriculture, then he held the tariff should be revised.

Saying that he believed that all manufacturing implements and tools used in production should be placed as near as possible on the free list. Mr. Taggart went on to deal with fertilizers. While admitting some justification for the ten per cent. duty on manufactured fertilizers, he held that the ten per cent. duty should be removed from acid phosphate. At the present time the price of fertilizer for 1921 delivery was from ten to twenty per cent. higher than a year ago, and that in the face of falling prices for farm produce. The increased freight tariff was responsible for an increase of from $1.50 to $3.00 a ton, and the duty was responsible for at least $2.00 in addition.

Favored Protection

Mr. Taggart admitted that some fruitgrowers were opposed to having the tariff removed from apples and other tender fruits, but said there were some good reasons for this. When Nova Scotia entered Confederation, they were to get the Intercolonial Railway and cheap freights, which would give them the Upper Canada market in lieu of the former New England Railway. They got the railway but not the cheap freight rates, and now they felt justified in having the duty on apples in compensation for the cost of the long freight haul.

With regard to the United States market, Mr. Taggart said that Nova Scotia farmers had been shipping large quantities to the United States under the free food policy of the Wilson administration. He feared that, if Canada persisted in keeping up the bars between the two countries in respect to tariff matters, there was every danger of the new administration re-enacting the old McKinley legislation.

Sir Henry Drayton asked whether Mr. Taggart had ever considered the question of the unfavorable trade balance with the United States and what should be done about it, but apparently could get no answer. Sir Henry also pointed out that, for the past eight years, Nova Scotia farmers had enjoyed free access to the United States market, which he considered rather upset the argument in connection with the loss of that market since Confederation. Dr. Cumming then interposed to say that prior to Confederation they had enjoyed a big trade with the United States. Between 1867 and 1912 they had lost the American market, and it was not easy to re-establish a market once lost.

Some Progress Made

Dr. Cumming was asked for his views on the farmers' statement, and replied that he would not go quite as far as that statement. He would say that agriculture had made some progress, but not the progress they had hoped it would, or which it should have made. Dr. Cum-

A Fish Drying Scene in Nova Scotia

ming had been fifteen years in the Department of Agriculture. In that period, substantial increase had been made in the dairy business. In 1908 the total output of the creameries was 100,000 pounds of butter; last year about 2,000,000 pounds. In grain, hay, potatoes, etc., there had been no substantial change. These crops were largely seasonal.

Sir Henry Drayton then went over figures in the Canada Year Book, showing that wheat production had increased from 165,806 bushels in 1891, to 248,476 bushels in 1901, and to 255,150 bushels in 1917. Oats had increased between 1891 and 1917 from 1,559,842 bushels to 3,597,800 bushels; potatoes from 5,113,612 bushels to 7,173,000 bushels; turnips and other roots from 1,349,076 bushels to 3,193,000 bushels, and hay and clover from 632,391 tons to 894,300 tons. Dr. Cumming estimated that the value of all crops last year was about $50,000,000.

"May I point out," said Sir Henry, "that instead of agriculture languishing, we find that in the year 1901 the value of these field crops was $16,669,321, as against what you now state is $50,000,000."

More Fertilizer Used

Dr. Cumming said there were several causes contributing to the increase in production, one of which was the more extensive use of fertilizer. Referring to apple production, he said that this varied very much, running from 500,000 to 1,500,000 barrels in the last fourteen or fifteen years.

Sir Henry Drayton next asked Mr. Taggart for his views on revenue, but was met with the reply, "I am not here to discuss this with an expert." Asked for suggestions, he reiterated his remarks about the difficulty of getting labor. He was not, he said, in a position to take up the question of a Dominion land tax. He had never gone into keeping records and had no information as to production. He had no objection to the income tax, but did not pay any. His main trouble was labor and the high cost of everything he had to buy.

Hon. Mr. Robertson, dealing with Mr. Taggart's argument that high freights prevented them from shipping apples to Montreal, pointed out that British Columbia apples were on sale in Nova Scotia and said that, if rates were prohibitive to Quebec, it was difficult to understand why B.C. apples could be sent all the way to Nova Scotia.

Would Not Name Industries

In reply to Sir Henry Drayton, Mr. Taggart said he was not prepared to single out any industries which were getting more assistance from the tariff than they ought to.

F. H. Johnston, United Fruit Company, explained that the reason why B.C. apples came in was because they were a little more attractive in appearance and were put up as fancy apples, commanding a higher price. They were not complaining very much about the apple business. They complained a little of the ocean and rail freights. The latter were $2.50 a barrel as against 60 cents before the war. Asked whether they wanted the protective duty taken off apples, Mr. Johnston said they would not mind; it did not make much difference to them. Asked whether there was anything the Fruit Growers' Association wanted the Government to do about the fiscal question, he replied, "Nothing very particular. We are getting along fairly well."

R. H. Mackay, New Glasgow, Chairman Maritime Division, C.M.A., presented a brief on behalf of the smaller industries in the Pictou District. The principal growth of this community dated from 1874, when the iron and steel industry had its beginning in the establishmer of the Hope Iron Works at New Gla gow. The small industry had some di ficulty in living through the har times of '77 and '78, and received i first stimulus from the tariff prote tion of 1878. This stimulus resulted i the formation of the N.S. Steel Co Limited, in 1882, and the productio of steel in Canada for the first tim in 1883. Mr. Mackay then traced th growth of the industry, and th changes in protection which wer made from time to time, showing ho other industries had sprung up as result of the presence in the con munity of a basic iron industry. Th growth of the entire community an its industries was due to the fosterin influence of a protective policy.

Demand for Farm Produce

Figures were presented to show ho the district had grown, with statistic covering the extent and production its industries. The growth of the town had meant a tremendous impetus give to the demand for farm produce—on creamery alone distributing approxi ately $1,200 a day among the farmers the neighborhood. The smaller indu tries were naturally anxious that not ing should be done which would affe the steel industries of the communit They employed between 600 and 800 me

J. F. Fraser appeared on behalf of t pork packing industry. He explain that, generally speaking, the price hogs in Canada had been from three four cents per pound higher than in t American market. Notwithstanding t present duty of two cents per pound, co siderable American product had be sold to the Maritime trade during t past few months, and at much low prices than the cost of hogs would w rant. This seriously curtailed the m ket for the home-cured product. T could not but have a serious effect the outlet of the local packers, beca of the fact that their trade was lo conditions being such that an exp trade was not profitable. Any reduct in duty would have a serious effect the production of hogs in the Marit Provinces.

A Halifax Industry

H. Goudge presented a statement behalf of the Starr Mfg. Co., Limi This firm had been in business s 1868; capitalization was $398,000, hal six per cent. preferred and half in mon stock. To date, no dividend been paid on the common stock and had not always been able to pay the ferred dividend. The business was unduly profitable. Their output was iron, bolts, nuts, and skates; yearly put averaging slightly over $400 Their market was Canada as a wh in some lines the Dominion abso about 95 per cent. the remainder g to the United States, Newfoundland

Jamaica. Prices of bar iron and higher grades of skates have been, generally speaking, somewhat lower in Canada than at comparable points in the United States. In making prices they took into consideration neither the tariff nor foreign competition. They employed a staff of 200. Machinists received from 65 to 75 cents per hour. Some men made upwards of $200 per month. They were able to continue in business only because they controlled a fair share of the home market. Had they not protection, they would lose a portion of the home market and be no longer able to compete with United States manufacturers, who, with larger production and lower costs, could undersell them.

R. L. Graham, Maritime manager of the Consumers' Cordage Co., Limited, appeared on behalf of that company, which operates factories at Dartmouth, N.S., and Montreal, and asked for alteration of customs tariff item 682, admitting lead ropes for fishing nets, and Manila rope, not exceeding 1½ inches circumference, for holding traps in lobster fishing, free of duty. They did not find difficult with fishermen getting these ropes free of duty, but claimed that large quantities were imported, presumably for fishermen's use, and which were used for entirely different purposes. The company suggested a duty of 25 per cent. with a 99 per cent. drawback where the rope was to be used for fishing purposes. Mr. Graham answered a number of questions about the production and price of binder twine.

The proceedings at Halifax were wound up with an appeal from the Hon. G. H. Murray, Premier of Nova Scotia, for careful consideration of the needs of the iron and steel industry. He presented figures showing that the industry had an estimated pay-roll of $29,400,000 in 1920; paid in royalties on coal, $637,000, and employed 25,000 hands.

"Our population is only half a million," said the Premier, "and you have 120,000 of that population actually dependent on these two great industries of coal and steel. You can therefore see how serious a thing it would be if anything should happen to these industries. . . . The idea that, in a general way, I want to convey to you in respect to these two great industries is, that we are continually apprehensive with regard to the tariff. We have the great Republic to the south of us with her iron and coal industries, and there have been times in the past when there has been danger and there may be times in the future when there will be danger. I just wanted to point that fact out to you."

The Hearing at St. John, N.B.

Nov. 9.—The Commission met in the Council Chamber of the Board of Trade at 10 a.m. R. B. Emerson, president of the Board, welcomed the Commissioners. He was thanked by Sir Henry Drayton.

J. S. Fisher, vice-president C.M.A., spoke first on behalf of the manufacturers of New Brunswick. He pointed out that for various reasons, the agricultural development of the province was along the lines of mixed farming, and as the products of mixed farming were not as readily exportable as grains, the best market was the nearest market. To provide a home market, it was necessary that industrial expansion should take place. Natural resources furnished a broad field for development. Capital was necessary and this would be more difficult to secure were there any departure from the policy of adequate protection.

The growth of manufacturing in N.B. was enumerated. The number of establishments had increased from 628 in 1905 to 1,183 in 1918; the value of output from $23,183,951 to $66,855,078. There were at present about 20,000 people employed, with a payroll of approximately $17,000,000. In St. John city the number of establishments had increased from 114 in 1905 to 275 at present, while output had increased from about $7,000,000 to about $20,000,000. Agricultural development was almost entirely in districts in close proximity to industrial centres. Mr. Fisher then presented lists showing the varied classes of manufacturing in which the people were engaged.

He next illustrated by means of one map how scattered was the population of Canada as compared with the population of the United States, and by means of another map how convenient were the great centres of population of the United States with their highly developed and specialized industries to the Canadian market. The dumping Act was intended to safeguard Canada but it was unworkable in several ways.

"Never in the history of the world," declared Mr. Fisher, "has an attempt been made to overcome such a tremendous geographical handicap in seeking to weld a small body of people into a complete whole." He referred to the barriers that existed, which tended to drive trade north and south, and said that it must not be forgotten, when talking of a Canadian national ideal, that there were a great many people from Europe and the United States, who had not been here long enough to appreciate this. They quite naturally would advocate the removal of all barriers, even if it endangered Canadian nationalism. It was for those imbued with the ideals of Canadian citizenship to join hands in upholding every institution that contributed to a distinctive and independent national life.

As one of the most potent factors towards this end, interdependence in the exchange of commodities was most vital. There must be the cheapest possible transportation, and Mr. Fisher put in a plea for cheaper long haul rates. Dealing with the argument that articles should be manufactured in indigenous territory, he showed by taking the case of brushes, how impossible this would be. The whole Canadian demand for many lines did not offer sufficient volume to manufacture at a minimum profitable cost.

Effect of Exchange

Mr. Fisher then dealt with the exchange situation and declared that Canada's self-respect suffered through having her dollar at a discount, and we should do our utmost to right the trade balance. The protective tariff was necessary to this end. He referred to the establishment of protective tariff by many European nations and overseas dominions and showed how the United States under President Harding would be committed to a higher tariff.

"With the likelihood of our greatest competitors acting in that manner," concluded Mr. Fisher, "it would surely be folly for Canada to grant less protection to her industries than will enable them to expand, pay fair wages to their workmen and enable them to retain the major portion of our home market."

Mr. Fisher was questioned by Sir Henry Drayton with regard to his references to the dumping clause and to long haul freight rates, giving instances to show how the dumping clause was being evaded and how the freight rates handicapped maritime manufacturers in shipping to the West.

L. W. Simms, president and manager, T. S. Simms & Co., Limited, gave an interesting account of the company's business. It was established in a small way in 1872. Up to 1906 growth was slow, but since then rapid, and annual turnover was now about $850,000. In the whole history of the business there were only three years in which practically all the earnings were not turned back into the business. Paid-up capital was $245,000 and they made brooms and brushes. They had a staff of 300 of whom 60 per cent. were male. They had a hygienic plant and operated a residence for girl employees from outside points.

Japan a Competitor

Mr. Simms gave details of the industry showing that 7,500 different classes of raw or semi-manufactured material entered into the construction of their brushes, practically every country in the world contributing one or more of the raw materials. Competition in pre-war days was from the U.S. and Gt. Britain. Japan was now becoming a competitor, and figures were given to show how low were wages in Japan. Their broom business was confined to the east; brushes went all over Canada, while about 20 per cent. of their output went into export trade. The tariff enabled them to hold a substantial share of the home market,

while their export business enabled them to bring down their selling costs. Although their home market was only about 1/15 of that of U.S. manufacturers, they had been able to meet U.S. competition in Newfoundland and practically shut out U.S. competitors.

Their business was built up because of the tariff protection they had enjoyed. Were this removed or reduced American manufacturers, with their larger capitalization, could undersell them. Canadian protection was 17½ per cent. under the British preference, and 27½ per cent. under the general tariff. United States protection was 35 per cent. and had been 40 per cent.

Mr. Simms was questioned regarding wages paid, and stated that they averaged from $4.50 to $5.00 a day for male labor, while girls earned from $7 in the case of a beginner, up to $10 or $12 a week.

Benjamin Sheppard, a broom maker, asked that the Government should protect their means of livelihood by at least retaining the present tariff on brooms. The men were receiving a good living wage which made it possible for them to live in comfort and educate their children. If a depression came in the industry, they would either have to seek employment in some other industry at lower wages or go to the United States.

Lewis Connors, manager of Connors Bros., Limited, stated that the firm was established in 1890. During the first few years they employed in the fishing season an average of 20 employees and distributed in wages $250 per week. In a normal year they now employed about 350 hands and paid wages of $5,000. Value of output had increased from $50,000 to $1,000,000 a year. About 60 per cent. of output was consumed in Canada, the balance being exported. Their prices were as low, if not lower, than those of foreign competitors. If any changes were made in the tariff which would encourage larger importation into Canada, output would be diminished, production costs increased and plants would eventually have to be closed, forcing fishermen and other employees out of the country.

Mr. Connors answered questions regarding the kinds of fish packed by his firm and the number of fishermen from whom they bought. He stated that they were buying the catch of about 500 fishermen, consisting of about 50 hogsheads a day at from $5 to $10 a hogshead.

W. G. Clark, of J. Clark & Son, Limited, dealers in farm machinery, etc., stated that they sold potato machinery principally in the St. John River section of New Brunswick. It was imported for the most part from the United States. The potato growers lived adjacent to the State of Maine and wanted the same kind of machinery as the growers of that state. He claimed that the duty was unduly high on the machinery, and even higher on parts.

Waterfront Scene in St. John, N.B.

Albert George Pressly, shipper in a local cotton mill, said that under the present system of protection, they were enjoying prosperity. Employers had used employees with generosity and had raised wages without asking. They received also a 5 per cent. bonus; participated in a profit-sharing scheme and were covered by insurance. If protection was removed, the company would not be able to do this. Wages would be cut and in the end plants would be closed down. In St. John, cotton mills employed over 500 hands. If the mills closed, it would be hard to get other work without leaving the city. Mr. Pressly answered a number of questions regarding the profit-sharing plan and the wages paid.

James W. Walker, cotton employee and mayor of Marysville, stated that the town had 2,000 inhabitants of whom 650 were employed in the cotton mills, at an average wage of from $9 to $30 a week. Eighty heads of families owned their own homes valued at $250,000. The company had 190 families living in their rented houses at from $2 to $10 a month, including light and water. Under the bonus system employees last year received $22,000. Mr. Walker enumerated other advantages and said that any adverse change in the tariff would be disastrous to Marysville and would affect Fredericton as well.

Employees Testify

Alfred E. White, yard foreman of the Canadian Cotton Co., Marysville, corroborated the statement of Mr. Walker as to what would happen to the town were the mills to close.

Asa Libby, cotton worker at Milltown, N.B., said that any reduction in the tariff would have a serious effect on the industry there. He stated that conditions were much the same at Milltown as at Marysville.

C. O. Morris entered some complaint about tariff item 412 covering bolts, and asked that the item be changed from *ad valorem* and specific to *ad valorem* only.

W. S. Poole, first vice-president, United Farmers of New Brunswick, and president United Farmers Co-operative Co. of St. Stephen, read the tariff demands contained in the Farmers' platform. Asked as to what he would propose to do to replace the revenue that would be lost, he again read from the platform. Referring to the land tax, Sir Henry Drayton questioned Mr. Poole on the wild land tax. The latter thought that land held for speculative purposes should be taxed. He did not know of any such land in New Brunswick, however.

"How much money do you think the farmers ought to contribute to the national war debt by means of a land tax?" asked Sir Henry.

"I think they are contributing now to the extent of their ability," said Mr. Poole. He admitted they might stand a little more if they were placed in the same position as Canadian Cottons, but it would be a burden for many of them to pay even a dollar an acre on their cultivated land. It was his opinion, however, that such a direct tax would be less than the indirect tax now paid by the average farmer through the tariff.

No Suggestions to Make

Mr. Poole was questioned as to means of raising revenue. He said the farmers were not making enough to pay an income tax, and as to other suggested sources of revenue, he had no definite suggestions to make. It would, he said, have to be left to the Government to devise ways and means. He next answered a series of questions as to the produce of his farm and the costs of operating the same. He did not have any definite figures showing what he had sold, but was asked to submit them in writing.

W. G. De Wolfe, president Retail Merchants Association of New Brunswick, presented a resolution of his association asking that the luxury tax be discontinued at the earliest possible date, and that immediate relief be given from the present method of collecting by stamps. He was supported by Robert Macaulay; J. G. Harrison of W. H. Thorne & Co., Limited; H. V. Rising of Waterbury & Rising, Limited; P. L. Higgins, Moncton; George L. Warwick, Wm. Hawker and F. A. Dykeman.

T. W. Caldwell, M.P., president of the United Farmers of New Brunswick, presented a statement giving the views of that organization on the tariff question. It reiterated support of the platform of the Canadian Council of Agriculture. Proceeding, it dwelt upon the present duty on agricultural implements and fertilizers. In the first place the New England States were the natural market for the surplus of farm products. About 80 per cent. of this surplus went to the United States. The duty on implements and fertilizer made it practically impossible for them to compete with the American farmer. Figures were submitted showing the cost of the same machinery in New Brunswick and in Maine, this being made both in the United States and Canada. The result was farmers were leaving New Brunswick and going across into Maine. The same difference in price applied to motor cars.

Mr. Caldwell was asked by Sir Henry Drayton if the farmers' organization would consider a land tax of $1 an acre objectionable, if everything that was used for the farm was made free.

"The feature of the tariff that I object to personally," replied Mr. Caldwell, "is that it is collected by the Canadian manufacturers, or even worse, by the American manufacturers with branch factories in Canada, and does not go into the revenue of the country. I do not think we object so much to the duty collected on goods imported."

"You are objecting to the Customs Tariff," said Sir Henry, "and a duty works just the same in either direction; I mean you have got to have a tariff."

Mr. Caldwell expressed willingness to have a tax on unimproved land but not on improvements. When Sir Henry mentioned the expense in valuing land and suggested a way of avoiding that by having a flat rate, Mr. Caldwell said that the farmers' organization was willing to tax unimproved values. He added that the farmers were willing to make any contribution fair and equitable compared with the rest of the people.

A discussion followed on the income tax. Sir Henry asked whether farmers would be willing to pay on the same basis as the city man, that is to say on gross, instead of net income. Mr. Caldwell replied that the farmer was not exempt on anything the city man was not but only on his fertilizer, seed and cost of production. He was then questioned about his farming operations.

The Session at Moncton

Nov. 10.—The inquiry opened in the City Council Chamber at 10 a.m. J. L. Macdonald, Atlantic Underwear Co., appeared on behalf of the manufacturers of Moncton. After endorsing the position taken by the C.M.A. Mr. Macdonald gave some statistics of the industrial growth of Moncton. The city had a population to-day of 20,000. In 1900 it had 21 manufacturing establishments; in 1918, it had 51. Output had increased from around $1,000,000 in 1900 to over $3,500,000 in 1918. There were over 1,200 employees in the different industries. With dependents, they numbered nearly 4,000 people. They occupied approximately 700 houses. Most owned their own homes. Mr. Macdonald referred to the abundant resources of New Brunswick, but said that capital for their development would not be forthcoming if there was any doubt as to the continuation of the policy of protection.

Mr. Macdonald pointed out that the owners of the industries were not men of wealth, but were the everyday people of the province, and the capital employed was furnished generally by shareholders in sums running from $100 to $1,000. The United States policy of protection has brought prosperity to the people of that country; it would be a safe one for Canada to follow. Other nations were jealously guarding their home markets; why should Canada alone voluntarily assume the role of Cinderella in the family of nations? He was assured that the people of New Brunswick were not ready to see their manufacturing plants close up and their sons and daughters seek employment across the line on account of the home markets being supplied by the Germans and the Japs.

Mr. Macdonald answered a number of questions about his company. He stated that they imported from one-third to one-half their wool from Australia, South America and South Africa, and mixed it with native wool. They bought cotton from the United States and most other raw materials from Canada. They employed from 300 to 400 hands. Girl employees got from $9 to $20 a week and men from $18 up to $50. Their payroll was about $12,000 a month and output from $750,000 to $1,000,000 a year.

A. C. Chapman appeared for the New Brunswick Wire Fence Co., Limited. The company had a capitalization of $32,000 and a rest account of $35,000, which represented the undistributed profits of 21 years. Operating capital was $67,000. They had paid, almost without interruption, a ten per cent. dividend, which was less than five per cent. on the capital employed. Output was about $160,000 per annum, twenty per cent. of which was sold to railway companies and the balance to farmers. Before the war they bought the bulk of their raw material from Sydney, but since then they have had to purchase their wire from the United States, because the Sydney mills had ceased making it. This wire is admitted duty free, while on their finished production they had fifteen per cent. protection.

What Can Be Done

"With this protection, so long as our raw material comes in free, we feel that we can hold the needed proportion of our home market and continue to operate on a narrow margin of profit; but this can only be done under the most efficient management, by careful buying and by keeping our selling cost at the lowest possible figure." Other larger companies had been forced out of business.

Owing to fluctuations in the price of raw materials, it was difficult to make comparison between American and Canadian prices for finished goods, but in normal times, prices were about on a par.

Mr. Chapman explained that they made their own machines, and a machine operated by four men would turn out from 1,000 to 1,800 rods of fencing per day. They had a staff of thirteen and wages averaged from 50 to 70 cents an hour. Men were paid the whole year through, even though the plant might be closed down. This resulted in retaining the staff permanently. They never had any labor trouble. Reduction of the tariff would put the industry out of business.

Questioned, Mr. Chapman said the prewar price of wire was $1.65 or $1.75 a hundred at Sydney. It was now $4.20 f.o.b. Pittsburg. They required about 2,000 tons a year.

The Linen Industry

W. C. Newcomb, president and general manager, Maritime Linen Mills, Limited, stated that they commenced business in 1918, manufacturing linen towels, which were dutiable under the British preferential tariff at twenty per cent. They imported linen yarn from Japan, but looked to the time when yarn would be spun in New Brunswick. Their market covered the whole Dominion, but as towels were one of the classes of goods which, at certain seasons or periods, were difficult to dispose of, they had extended their activities to shirtings, tweeds and shirts, buying woollen yarn in Canada and cotton yarn in Canada or the United States. Markets for tweeds, shirtings and shirts were practically confined to the Maritime Provinces. Their paid-up capital was $24,000. The first year they paid a seven per cent. dividend, but nothing since. Employees numbered about 20. In so far as the lines they made

were concerned, they did not feel that they could operate and retain their home market with less protection.

A. E. Trites appeared as representing, to a certain extent, the farming industry of New Brunswick, and made some observations on the Canadian customs tariff in its relation to the agricultural industry of the province. He pointed out that all conditions in New Brunswick tended to the development of mixed farming. The live stock industry was affected detrimentally by the high freight rates to Montreal and Toronto, and the only relief could come from the development of a larger local market. He therefore urged that no changes should be made in the customs tariff which would in any way adversely affect the manufacturing industries.

He instanced the growth of Moncton, which provided an important market for the produce of the surrounding farms. The home market was the farmers' best market, and an endeavor should be made to attract and develop industries, which could be done most quickly and surely by adequate protection. The farmers were receiving protection on meats, butter, cheese, eggs, poultry, live hogs, etc., and the duties imposed were of material assistance against the dumping of such products when prices were depressed elsewhere. Prices of farm lands were also increased as a result of the growth of industrial centres. He concluded by saying that a general reduction in the tariff would not be in the best interests of the farmers.

Mr. Trites answered questions about his farming operations, and gave information about farm values. He stated that he was president of the Maritime Stock

(*Continued on page* 98.)

INDUSTRIAL STATISTICS OF PRINCIPAL CITIES AND TOWNS OF CANADA FOR 1918

Preliminary Report Compiled by the Dominion Bureau of Statistics

Cities and Towns.	No. Establishments.	No. Employees.	Salaries and Wages	Capital	Cost of Materials	Value of Products
Montreal, Que.	2,375	157,878	$110,196,219	$468,401,480	$291,973,466	$551,814,605
Toronto, Ont.	2,835	106,128	105,509,698	392,945,178	266,580,781	506,429,283

Traffic Managers of Canada Building up Useful Organization.

By W. R. BRYAN.

This is the story of a lusty four-year-old Association, closely allied in its membership and interests with the Canadian Manufacturers Association, and doing valuable work, in co-operation with the railway companies, in improving transportation methods in Canada. The organization has had a rapid growth, and held an enthusiastic annual meeting last month.—The Editor.

IN the Canadian Traffic League, organized October 2, 1916, the traffic managers of Canada have an association that seems destined to play an important part in transportation affairs. It was formed during the stormy days of the Great War by a small group of enthusiasts in Toronto. It has subsequently expanded appreciably, until to-day it has approximately one hundred members, who are located in several of the principal industrial centres of the country.

Just what is the Canadian Traffic League?

For answer, consult the revised constitution that was put through at the recent annual meeting. This is what that document has to say on the subject:

"The object of the League shall be, by the interchange of ideas and the study and discussion of questions of mutual interest;

"1. To promote a better understanding by the public, provincial and Dominion Governments, of the needs of the traffic world;

"2. To secure modification of present laws, regulations and rulings, where they are harmful to the free interchange of commerce;

"3. To advance fair dealing;

"4. To promote, conserve and protect commercial and transportation interests;

"5. To co-operate with the Board of Railway Commissioners of Canada, other regulating bodies, the Canadian Manufacturers Association and similar organizations, and the transportation companies, thus bringing about better transportation conditions generally."

Purposes Mainly Educational

It will thus be seen that the League has mapped out for itself a programme of work that should have far-reaching results in improving the standard and efficiency of transportation in Canada. Its purposes are in the main educational. By bringing transportation managers together for a discussion of traffic problems and by inspiring members to study these problems and put into application the solutions best suited to each the League is promoting the cause of greater efficiency. Nor is the education confined to members of the League. They in turn become apostles of improved methods to the public generally, who are reached through governments and organizations of one sort or another.

The League's existence has been simply justified by the growth in the membership and the enthusiasm of the members. It originated four years ago as the result of a suggestion thrown out by W. C. Thompson, traffic manager of the Goodyear Tire & Rubber Co., Limited. The same idea had also occurred about the same time to S. B. Brown, assistant manager of the Transportation Department of the C.M.A. An organization meeting was arranged, and on October 2, 1916, with nineteen charter members, the League was brought into being. It had then as now the sanction of the management of the C.M.A. and has always worked in close co-operation with the latter body.

The charter members of the League included the following traffic managers: A. C. Archambault, Wm. Wrigley, Jr. Co., Limited; H. Blahout, Page-Hersey Iron, Tube & Lead Co., Limited; S. B. Brown, Canadian Manufacturers Association; N. M. Ford, Dunlop Tire & Rubber Goods Co., Limited; J. Foster, A. R. Williams Machinery Co., Limited; A. E. Gore, Canadian Fairbanks-Morse Co.; H. P. Howard, Canadian Stewart Co.; R. S. King, Campbell Flour Mills Co., Limited; E. A. Larsen, Swift Canadian Co., Limited; W. E. Minty, Gunns, Limited; A. W. Pengelly, Cowan Co., Limited; C. H. Portch, Canadian H. W. Johns-Manville Co., Limited; A. Scott, F. W. Woolworth Co., Limited; J. W. Spivey, Lever Bros., Limited; John H. Stevenson, Grand & Toy, Limited; W. C. Thompson, Goodyear Tire & Rubber Co., Limited; H. E. Uttley, Harris Abattoir Co., Limited; H. R. H. Williams, Steel & Radiation, Limited.

The League holds monthly meetings, the first Wednesday each month. Hitherto most of the meetings have been held in the C.M.A. offices in Toronto, with an occasional gathering in Hamilton. It is the intention, however, as the membership spreads to other cities, to alternate the meetings so that the interest will be made as widespread as possible. The League now has members not only in Toronto, Hamilton, London, Ford, Ont., etc., but in Montreal and Winnipeg. It is intended to make the organization thoroughly national in scope with a national outlook.

Works Through Committees

The work of the League is carried on by an executive council, consisting of the president, vice-president, secretary-treasurer and five members, together with a number of standing committees, whose designations are railway legislation and bill of lading committee; express traffic committee; rate construction and tariff committee; claims committee; classification committee; export committee; and refrigeration and car service committee. To these committees are referred such questions as may arise in the several departments of activity.

Naturally the progress of the League towards its ultimate objective has been gradual. There has been no idea of rushing matters until the organization could be thoroughly perfected. Thus, up to the present time, the League has not made any public appearance in connection with any of the transportation questions of the day. No doubt, later on, when the membership becomes larger and more representative, such action will be taken. In the meantime, the value of the organization, as already indicated, lies in its educational features. It has already served to bring to the attention of members points that they had not been familiar with before, enabling them to handle traffic more economically and thus save money to their firms. Members have been apprised of the best methods of loading and marking; they have been taught to keep records and as a result claims have been eliminated and much unnecessary work, such as tracing, obviated.

Relation to C.M.A.

There is a close relationship between the League and the Canadian Manufacturers Association. Mr. Walsh, the general manager of the latter, is honorary president of the former. Mr. Brown, the assistant manager of the Transportation Department, was the first secretary-treasurer of the League and is now a member of its executive. Mr. G. P. Ruickbie of the Transportation Department, Canadian Pulp and Paper

Association, has just been elected Vice-president. Further, membership in the League is limited to the traffic managers of industrial and commercial companies and is very largely made up of representatives of manufacturing concerns, which are members of the C.M.A. The League, however, is quite distinct both in personnel and functions from the Transportation Committee of the C.M.A. The latter is concerned more with policies than with practice. The League aims to smooth out difficulties that arise and to facilitate the movement of freight by co-operating with the railroad companies. In fact, the latter feature is very prominent in the work of the League, and it has been cordially endorsed by such railroad officials as have addressed meetings of its members.

Starting in a modest way, the League has not yet established its own office, nor has it a salaried staff. These are both developments that will come later on. At the last meeting membership fees were raised somewhat with a view to obtaining funds which might be used or required for hiring people to compile information, to publish charts and to perform other services of this kind. Other features will be added from time to time as the organization becomes more firmly established.

Annual Meeting Held

The annual meeting of the organization was held in Toronto on Wednesday, November 3, the council chamber of the C.M.A. head office being filled to overflowing with members. The proceedings were followed with much interest by all present, evidencing the value which the League has attained in the eyes of those associated with it. The constitution and by-laws were revised and placed on a more comprehensive basis. Hereafter there will be three classes of members instead of one. An honorary membership has been created to take in those who, while not directly engaged in traffic management, are interested in the subject. Next come the active members who are limited to those actually employed as traffic managers. Finally, there are now associate members, comprising assistants and juniors in the traffic departments.

Guests at Banquet

At the annual banquet held in the evening the chief guest was D. B. Hanna, president of the Canadian National Railways. There were also present: J. E. Walsh, general manager of the Canadian Manufacturers Association; Acton Burrows, editor of the *Railway and Marine World;* R. W. Long, Division Freight Agent, G.T.R., Toronto; M. H. Brown, Division Freight Agent, C.P.R., Toronto; Wm. Grant, District Freight Agent, C.P.R., Hamilton; and G. C. Martin, General Traffic Manager, T. H. and B. Railway, Hamilton. All the speakers united in approval of the idea and purpose of the League, and Mr. Long went so far as to say that it was the best thing that ever happened in railway relationships. He thought that the railway companies should welcome the formation of the League, for the work it aimed to do would be of great advantage to them.

President Hanna of the C.N.R. devoted the major portion of his speech to the subject of the development of export trade. He believed that the manufacturing interests of the Dominion should co-operate with the railways in an effort to develop a greater Canadian export trade. The fleet of the Canadian Mercantile Marine, numbering seventy-seven ships, representing 404,000 deadweight tons, was at their disposal, Mr. Hanna said, and the day is near at hand when the Canadian flag will fly at the masthead on the seven seas. He was prepared to put steamships in service between Canada and any foreign country where the business justifies the establishment of it. So far as the Canadian Mercantile Marine was concerned, it did not want a five cent piece of subsidizing by the Government. This was one of the things that should give the manufacturers and the steamships great hope, and it was most important that new markets for the Canadian export trade be established if Canada expects to get rid of the heavy debt which has been piling up.

C.N.R. Employees

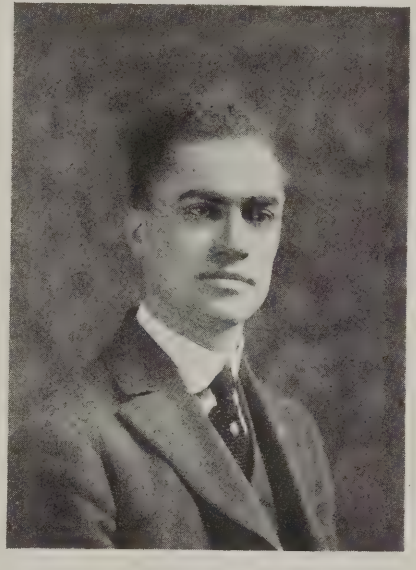
"A great amount of criticism has been levelled at me because I will not permit employees in the service of the Canadian National Railways to accept nominations for Parliament," asserted Mr. Hanna. There has been no attempt on my part to prevent an employee exercising his franchise as a citizen, but when he decides to become a politician the whole

Immense Railroad Yards at Winnipeg

country is open to him. We employ men to work and not for the purpose of a divided interest. It is not practical and as the question has been camouflaged by so many people saying that the liberty of the employee has been usurped, you can readily see the foolishness of it. As long as I have the power to say—and the Board of Directors back me up—we will not permit politics to interfere with the operations of the Canadian National Railways or the Canadian Mercantile Marine. So far as the present Government is concerned, no attempt has been made to interfere in any shape or form in the carrying on of our work."

Question of Freight Rates

Referring to the application of the railways for increased freight and passenger charges, Mr. Hanna declared that no country in the world enjoys lower freight and passenger rates than Canada. They were much lower than in New South Wales (Australia), Great Britain and Germany.



He believed that Canadians did not realize how much they are indebted to the railways for the low rates furnished by Canadian railways compared with those of other countries under the British flag. As an illustration of this point, Mr. Hanna said that the Canadian railways had to haul one and a half tons of freight a mile to earn the price of a five-cent cigar. The increase in rates had not increased in proportion to wages now paid railway men. In 1913 the average wage paid was $706 per year; 1920, $1,860 a year; while the recent increase granted will bring it up to $2,000 a year. Mr. Hanna asserted that he was just as anxious as the men to see that they were given a good living wage, but, at the same time, rates should be increased so as to meet the high wages paid. "I know of one case of an engineer, running on a small branch line, who is paid over $5,000 a year," said Mr. Hanna. "And another instance where a station agent, who sees a train once in a while, and takes down a red lantern at night, receives $350 a month.

Country is Prosperous

"I have just returned from a tour of inspection of 10,000 miles of the Canadian National System, and I found nothing but a great wave of prosperity pervading the whole country. I am bound to say that I have never seen a better outlook for the coming Spring. I am satisfied that next year there is a possibility that we will have another 1915 crop. If that be so, it means more business for the manufacturers and the railways, providing we can get rid of the existing condition of unrest respecting unemployment. What has been the basis of the prosperity of the United States? It has been based on the development of five natural resources—mining, fisheries, lumber, agricultural lands and water powers. We have all these resources. The experimental stage of development is past, and it is up to Canada to get busy if she hopes to keep abreast of production by the Republic to the South.

"We should in some way encourage immigration by co-operating as a great family, so that we may give to the present generation a better environment than they enjoy in the Old Land. We should not populate Canada with any race but the English-speaking classes. If I had my way, that is what I would insist upon. The business interests of Canada can do much towards bringing about such a condition. In fact, we should keep in mind one thought: 'Bring to, and give to, Canada the best people that we can get.'"

A hearty vote of thanks was tendered Mr. Hanna by J. E. Walsh and Thomas Marshall, traffic managers of the Canadian Manufacturers Association and the Toronto Board of Trade, respectively, on behalf of the members. A. W. Bell, Oshawa, the retiring president, presided.

F. W. Dean

Traffic Manager, Steel Co. of Canada, Limited, Hamilton; President, 1920-21, Canadian Traffic League

The officers of the Canadian Traffic League for 1920-21 are the following:—Honorary president, J. E. Walsh, general manager, Canadian Manufacturers Association; honorary vice-president, T. Marshall, traffic manager, Toronto Board of Trade; president, F. W. Dean, Steel Co. of Canada, Limited, Hamilton; vice-president, G. P. Ruckbie, traffic manager, Canadian Pulp and Paper Association; secretary-treasurer, A. H. Thorpe, William Davies Co., Limited; auditors, W. E. Minty, Gunns, Limited, and H. Blahout, Dunlop Tire and Rubber Goods Co.; Executive Committee, S. R. Brown, Canadian Manufacturers Association; W. S. Campbell, Canadian General Electric Co., Limited; W. R. Caldwell, Dominion Canners, Limited, Hamilton; N. Boyd, Gutta Percha and Rubber, Limited; L. R. Howe, Toronto Board of Trade.

Good Progress Made With Lignite Plant

ACCORDING to a report appearing in the *Public Service Monthly* of Saskatchewan, good progress has been made on the erection of the demonstration plant at Bienfait for the Lignite Utilization Board, although there has been such extremely slow delivery of some of the material required that it will be impossible to have briquettes on the market as early as anticipated.

To date, the Board has let the contracts for the supply of all buildings and equipment with the exception of carbonizers, piping and housing. Plans and specifications for the carbonizers have been distributed and the piping layouts prepared and the whole question of housing has been arranged and drawings and specifications are being completed.

Important Problems Solved

The two most important problems solved by the Board before work on the demonstration plant was begun, were the carbonizing and briquetting of lignite coal.

As mentioned in a previous article, the Board was forced reluctantly to the opinion that no commercial carbonization of lignite had ever been undertaken and thereupon set itself to devise a type of apparatus that would carbonize lignite under commercial conditions. This was successfully accomplished and during the months of July, August, September and October experimental runs were made on the carbonizer in Ottawa. The net result of the experiments was that the Board became convinced that the problem had practically been solved. This fact enabled the chairman to announce at a public meeting of the Board, held in Winnipeg in October, 1919, that the Board had decided to proceed with the erection of its main plant.

The difficulties confronting the Board on the question of briquetting were not so large as those of carbonizing, and yet the economic aspects were serious. It became apparent that the published results of briquetting experiments conducted by other investigators on anthracite were not at all applicable to the briquetting of carbonized lignite. As an example of this fact it may be noted that to produce a good briquette from carbonized lignite requires almost double the quantity of binder necessary to make a correspondingly good briquette from anthracite fines. This condition made it essential that the Board should know beyond peradventure the minimum amount of binder necessary to produce a first quality briquette in order to judge of the future cost of such a product.

During the progress of the Board's investigations the following substances have been tried as binding material.

Coal tar pitches, hard wood tar pitches, sulphite liquor pitches, lignite tars, asphalts, petroleum pitches, cement, resins, starches, flour and flour screenings, water glass, waste straw jelly, etc.

Some of the Preventable Causes of Fatigue

A COMMON SENSE SUMMING UP

By THE SECRETARY
Committee on Industrial Fatigue

In the June Issue of INDUSTRIAL CANADA, *we published an article telling of the formation of the Committee on Industrial Fatigue, and giving the names of those comprising its membership, together with an account of the purpose for which it was created. This article was of a general nature. We now give readers of* INDUSTRIAL CANADA *a second article of a somewhat more practical character, which goes more minutely into the causes of fatigue.*
—The Editor.

THE problem of "Fatigue" in industry which has been receiving a great deal of attention in recent industrial literature and will, it may be prophesied, receive a great deal more is, of course, an old problem. The fact that it is coming so much to the fore at present is one of the many signs that the necessity of allowing for the "human element" in industry has been recognized —and this not on humanitarian grounds alone but also on the grounds of practical common sense. Other signs are apparent in the fact that departments known as "Industrial Relations Department," "Welfare Department," "Mutual Help Department," "Service Department," and the like, are becoming almost universal in any large concern.

Some Effects of Fatigue

Now fatigue in its various aspects—its *detection*, its *prevention or control* and its *effects*—is probably the biggest factor in the "human element" problem presented to industry. While its effects cannot be precisely shown either in the figures of sickness records or in the curves of output charts, they are none the less present in both. Although "fatigue" may not be explicitly stated in any sickness record as a cause of absence, the chances are that it is a contributing factor in very many of the causes which are stated. It plays its part doubtless in the time lost "for personal reasons" and equally, though less obviously perhaps, in the time lost through specific illness, not only such as general debility or mental illness, but also such as, say, bronchitis or some infectious disease where fatigue caused susceptibility. Similarly, fatigue is either an absolute or a contributing cause of lateness, slowing down (whether voluntary or involuntary), accidents, spoilt work and the like. Again it may be suspected as having something to do with friction between employer and employee and with the general spirit of unrest and discontent.

What "Fatigue" Means

And now it might be well to ask ourselves "what *is* this fatigue which evidently plays so large a part in industrial inefficiency? What exactly do we mean when we say that certain workers are industrially fatigued?" In the first place "fatigue" is not merely another name for tiredness. Tiredness is a symptom of fatigue, but the fatigue itself may have been doing its enervating work in the human frame, throwing off at the same time its inevitable effects in the way of inefficiency, long before the symptom of tiredness appears. Workers who are suffering from industrial fatigue are not simply workers who feel tired—whether they feel so or not depends on the stage of their fatigue. They are workers whose capacity for work is steadily, day by day, diminishing. And here we see the reason of the argument which is becoming so common—namely, that it is in the employer's own interests, in the interests of his cash profits, to put it crudely—that fatigue should be eliminated as far as is humanly possible. A workman whose capacity for work is diminishing day by day will be, almost inevitably, one whose efficiency also is diminishing day by day.

Causes of Fatigue

The first step towards reduction of fatigue is recognition of its causes. Perhaps the clearest way of getting at these is to sub-divide them in our minds into *circumstantial causes* and *personal or individual causes*. Under the first class will come all the material conditions of a man's working and home life, as for instance hours of work, kind of work, housing, food, etc. Under the second all the factors to do with a man's individuality,—his age, his health, his private worries, his adaptation (both physical and psychological) to his job.

The Chief Cause

This last factor is the crux of the whole matter. There is scientific support for the view that if the problem of industrial fatigue is to be solved—if, that is to say, fatigue is to be reduced to its lowest possible degree—it will only be through study of this point—the question of the *adaptation (both physical and psychological) of the worker to his job*. This is a subject far too wide and too technical for the scope of the present paper. It is mentioned here in passing simply because no consideration of fatigue could be complete which did not recognize this problem as the central one which confronts every employer of labor and the most subtle one of all the many subtle ones which an employment manager has to face.

Other Causes

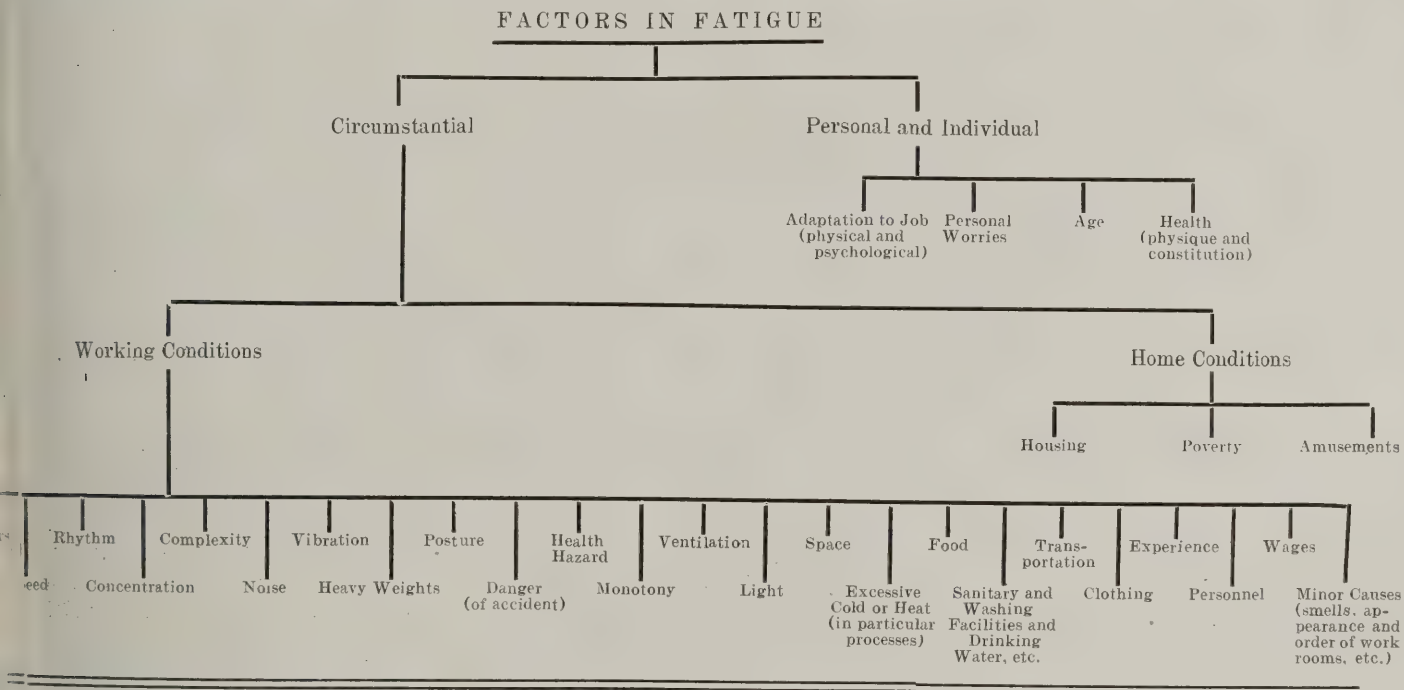
The simpler and more concrete causes of fatigue, that is to say those grouped under the main heading of circumstantial causes must be sub-divided again in our minds into two classes—*those connected with working conditions* and *those connected with home conditions*. These last include questions such as housing, cheap amusements, public parks and libraries, etc., and are the concern of all interested in the welfare of humanity, whether they be legislators, government officials, social workers or private individuals.

Causes of Fatigue Due to Working Conditions

These are the peculiar business and responsibility of employers, and are briefly as follows:—

I. *HOURS OF WORK.*—From the practical point of view of industry the question here is largely an economic one. It obviously does not make for economic production habitually to pay full wages to employees for time when owing to fatigue they are not doing full work. Purely for its own prosperity it is necessary for each industry to discover what is the "right" length of working day for its employees—for how long each day, that is, the normal employee may work to reason be counted as worth his pay. The answer necessitates for each individual plant a consideration of its peculiar demands on physical and nervous strength, the environment it offers, the nationality and calibre and class of its employees. The common sense at the bottom of all questions of hours of work is well shown in a statement of a British foreman about Sunday work at double pay during the war. He held that it "gave six days' output for seven days' work at eight days' pay."

II. *ENVIRONMENT.*—The next question is the employees' working surroundings. If wastage from fatigue is to be



ept at its lowest all unnecessary uses must be eliminated. Among unecessary causes are (*a*) *bad ventilation*, which the worker is forced to breathe tiated air; (*b*) *insufficient light* (either atural or artificial), inducing a sense of rain; (*c*) *insufficient space*, causing ther physical or nervous discomfort or th; (*d*) *extremes of temperature necestated by particular processes*, either exssive cold, which makes abnormal deands on the workers' vitality to keep arm or excessive heat by which the orker is enervated and rendered lanuid; (*e*) *disagreeable though harmless nells*, which cause irritation and dismfort.

In addition the more (*f*) *psychological ctors in the question of environment* is a natural and unconscious apportioning of the time spent on each movement in a series of movements. Here also a man's best work will be done, with the least waste of energy, if he is allowed to observe this natural rhythm of his own and as far as possible to work in any co-operative work with those whose rhythm is most like his own.

(*c*) Again, as regards *rest periods*, which are recognized as necessary in some processes, there is a "right" moment for the rest period to occur and a "right" time for it to last. In some plants experiment has shown that a ten-minute break in each hour has greater recuperative power and is therefore more economical than a twenty minutes' break in each two hours.

fatigue and reducing output, since after the introduction of carefully chosen chairs and tables the output hitherto attained by twenty operatives was equalled by sixteen operatives.

(*h*) *Noise and Vibration.* These must also be recognized as factors in the fatigue problem. The claim that "workers are accustomed to them" may be true of the normal experienced worker in average good health. It must very often be untrue of the beginner, the latent neurasthenic and even of the normal experienced worker when temporarily below par. A social worker in a certain plant recently volunteered the opinion that the increase in lost time which occurred in one room in the plant over other rooms where similar work

anifatigue should not be ignored. The appearance of a room, the color of its walls, its neatness and order all play some part in the fatigue or freedom from fatigue of its occupants.

II. *PHYSICAL AND NERVOUS STRAIN.*—The next point for consideration is the actual demands made upon the human organism by the different kinds of work or processes. The points to look for are the following:—

(*a*) *Speed.* It is a well known fact that for each individual there is a "right" speed, that is to say a rate at which he can continue working without unduly "fatiguing" himself and starting the decline of his energy. Where a speed in excess of this "right" speed is imposed on a worker, either by the greater natural rate of his companions or by the rate of machinery, there is inevitably a strain, both physical and nervous, to keep up and fatigue may be expected to follow.

(*b*) Similarly there is for each individual a natural *rhythm* or swing, that

Scientifically appointed rest periods are required not only for recuperation from the stress of speed, but equally for recuperation from the stress of work of great precision calling for a high degree of (*d*) *concentration of the faculties*, and in work necessitating (*e*) *complexity of movements*, as in telephone operating, where sight, touch and hearing must work in the closest co-operation. *Physical strain*, resulting either from necessity of (*f*) *lifting heavy weights* or from retaining a tiring (*g*) *posture* is another common cause of fatigue. Here the necessity of selecting only such workers as are not initially handicapped by poor physique is, of course, of paramount importance. As regards posture a great deal can be done simply by giving consideration to the choice of chairs and tables, etc., with a view to allowing the worker to take up a natural, comfortable and unstrained position. An experiment on these lines recently made in a Toronto firm gave practical proof that uncomfortable posture had been causing

was being done was due in great part to the fact that the workers concerned were exposed to the continual roar and throb of great machines.

(*i*) *Monotony.* This though an unavoidable element in every industry, is one of the most fruitful sources of fatigue. The only solution, apart from the wider question of providing healthful recreation during non-work hours, seems to be the commonsense and obvious one of alternating different kinds of work. This has been tried in some plants and has been proved possible and useful.

(*j*) *Accident and health hazards.* It will readily be granted that failure to guard against accidents and to reduce as far as possible health hazards, exposes the worker not only to the accidents and the occupational diseases themselves, but also to unnecessary nervous strain. The shock experienced at the occurrence of any serious accident, irritation where either accident or illness is attributed to managerial neglect, each man's fear of being

Contrasts of Half a Century Point to the Benefits of Protection

REMINISCENCES OF A BRANTFORD MANUFACTURER

By W. A. CRAICK

This is the first of a series of interviews with Canadian manufacturers, whose association with the industrial life of the country enables them to look back for forty years or more and contrast conditions as they were then with what they are now. The picture thus painted will serve to illustrate how important has been the application of the principle of protection in building up industry and providing a market at home in Canada for the products of the farm.

SEATED in his capacious private office, on the walls of which hang ranged the portraits of several pioneers of industrial enterprise in Brantford, Mr. C. H. Waterous, president and general manager of the Waterous Engine Works Co., Limited, gave me recently some exceedingly interesting recollections of earlier days in this busy manufacutring city. His memory can carry him back well before the adoption of the National Policy, when Brantford was a small town and when such of its industries as still survive, were carried on in a very limited way.

"Brantford used to be at the head of navigation on the Grand River," explained Mr. Waterous, "and that is what gave the place its early importance. I can recall how the street just above the canal used to be filled with wagons of grain after the harvest. These were unloaded into the warehouses along the canal and thence the grain was transferred to barges, in which it was taken down the river to Buffalo.

"All this section of the city where this plant now stands and where you will see other large industries located, was in those early days covered with clumps of trees. Yonder, where a populous section of the city now lies, were hop fields. The old swimming hole, to which we boys used to race after school, was just over there at that bend of the river, and it was about here that we used to start pulling off our clothes preparatory to a dip.

"This industry was located in the centre of the city right where the post office is now. It started in a very small way in 1844, being little better than a blacksmith shop. My father became associated with it in 1848. The first motive power was a horse, which shows how primitive were the beginnings. What did they manufacture? Well, to begin with, the first products were stoves and ploughs, both being articles that were badly needed by the settlers all in through the country to the north and west. The iron, you may be interested to know, was secured from Normandale, down near Lake Erie. It was made from bog ore. Those andirons in the fireplace there are samples of it. Later on, the company gradually added various lines of machinery and engines and boilers to their list of products.

"The original plant was a small frame building, not as large by any means as our present office building, and I suppose the space occupied was not one-twentieth of the area covered by our present shops. The frame building was superseded by a brick building and, as the business grew, additions were made from time to time until we covered about two-thirds of the post office block. We moved to our present site in 1896, since when the plant has been practically doubled in size."

C. H. Waterous

President and General Manager Waterous Engine Works Co., Limited

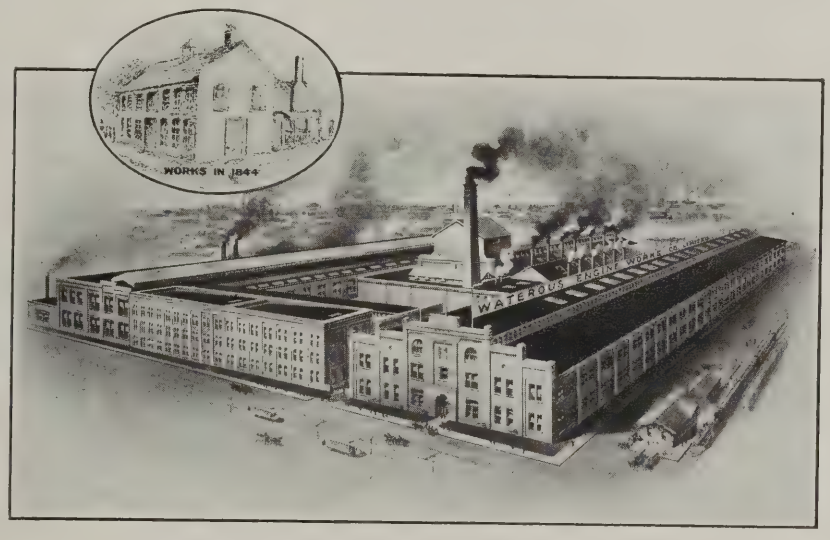
The story of the growth of the Waterous industry, which is typical of many others in Canada, has been contemporaneous with the development of the country's natural resources. Mr Waterous tells graphicall of the way in which th expansion of the lumbe ing industry has played it part in bringing busines to the plant. Back in hi boyhood days, lumberin flourished all through th western peninsula of On tario, and much of th lumber sawn was shippe down the Grand River fron Brantford. The Waterou Company did its share i equipping the sawmill that sprang up here and there in th district. Later, when the timber wa pretty well cleared away and the lumber men crossed over into Michigan, th Brantford industry continued to supply them with sawmill machinery, the re putation of their product having becom well established.

Mr. Waterous attributes to the passing by the Ontario Legislature in 1897 of th Act requiring that all timber cut o Crown lands in Ontario be sawn within the province, a great deal of the credi for the industrial development of Canada

"American lumbermen, having cleare out their own forests, were coming acros into those portions of Ontario adjacen to Lake Huron and Georgian Bay, an securing timber limits there. All the did was to fell the trees and float th logs across to their big sawmills i Michigan. This kept the American lur bering towns alive, but did nothing f Canada. When the Ontario Act w passed, an immediate change took plac Sawmills were built all around the shor of Georgian Bay and Lake Huron, tow sprang into existence and money w kept and spent in our own country.

"While this is not exactly a case of t application of a protective tariff to bui up industries, it is a similar procedu and its shows what can be done to crease our population and create busine by requiring the manufacture of lum in the country instead of sending the lo away to be sawn elsewhere. The legis tion making it compulsory to manuf ture wood pulp in Canada, from pu wood cut on Crown lands, is anot example of what can be accomplish for the pulp manufacturing industry h grown to great importance of rec years, largely as the result of the ad tion of this policy. To our own indust the development of pulp manufactur

has meant the receipt of large orders for machinery, which otherwise would scarcely have materialized."



Mr. Waterous is inclined to be mildly critical of the contention that industrial development in Canada is responsible for drawing people away from the farm.

From Country to Town

"It is perfectly true," he admits, "that people are leaving the country and concentrating in the towns and cities, but that is nothing new. They have always done it and I suppose they always will do it. Many of our smartest men and women, leaders in every walk of life, have come from the farm. What I wish to emphasize is that, if we don't get the boys and girls from the farms in our own Canadian cities and towns, we are going to lose them, as we used to do, to the cities and towns across the line. Is it not desirable, therefore, that, if the movement from country to city is destined to continue, such opportunities should be afforded in Canada as will serve to keep our young people in their own country? We want to have opportunities for them in manufacturing industry and this, I contend, is one very sound reason for maintaining such a tariff as will tend to bring new industries into existence and preserve those already existing business. I am glad to observe that conditions surrounding rural life are becoming more pleasant. The building of good roads, the introduction of the automobile, the extension of the telephone, and the increasing use of labor-saving devices are all tending to make the lot of the farmer and his wife better. I hope it will not only keep the young people on the farms but attract city folk back to the farms. At the same time the movement cityward is still a big factor and I want to see it so directed that we will lose as few people as possible."

Growth of Brantford

The City of Brantford itself, judging by its growth in population, has been successful in diverting not a little of the flow from country to city to its borders. It has been a typically prosperous industrial centre, adding each year to the number of its manufacturing establishments and thereby increasing the extent of its opportunities for work and advancement. It is a long cry from the Brantford of pre-railroad days, when the grain and lumber of Western Ontario were shipped down the Grand River in barges, to the Brantford of to-day, with its steam and radial railroad services, its street cars, its miles of well-paved streets, its fine public buildings, its parks and its squares, its mammoth factories and above all its thousands of prosperous-looking homes. Mr. Waterous has seen the gradual transformation and he knows, as do the big majority of his fellow-citizens, that there would be no Brantford of such proportions and such possessions to-day had it not been for the encouragement afforded to industry by the application of the protective tariff. There have been enterprising citizens and there have been other factors which have given Brantford a boost towards prosperity, but underlying all has been the indispensable tariff. Without it, many industries could never have been established, while others could scarcely have found it possible to reach their present proportions.

A 75-Year Contrast

The First Works of the Waterous Engine Works Co. Limited Compared With Those of the Present Day

The growth of Brantford stands clearly revealed in the census figures. Going back to 1871, when the first census of the Dominion of Canada was taken, it is found that the population of the place was then 8,107. To-day Brantford has attained a population of 32,786, which is four times what it was in 1871 and almost double what it was in 1901.

So far as industrial growth is concerned, an examination of the self-same census of 1871 shows that for the whole of the riding of South Brant, the capital invested in manufacturing industry was $494,190; the number of hands employed was only 1,237; the amount of wages paid for the year was just over $300,000; the value of the raw materials used was slightly under $1,000,000 and the products manufactured were valued at $1,850,627.

Contrast these figures with the recently issued figures of the Bureau of Statistics for 1918, and the amazing extent of the industrial expansion of Brantford in the past half century is graphically illustrated. In 1918, on the Dominion Government's basis of estimating, there were 181 industrial establishments in existence within the city, these having a combined capitalization of $40,724,243 and a staff of workers numbering 8,208. In wages paid, there was expended $8,222,296, and in raw materials purchased, $19,168,364. The value of the products manufactured was over $35,000,000. All these figures were very much in excess of previous years though there is no doubt that they will be far surpassed by the figures for 1919 and 1920 when these are issued.

Eighty-six Industries

The Brantford Chamber of Commerce reports eigthy-six industries in the city, of which sixteen are branches of United States factories. Within the past year such important branch industries as those of Robbins & Myers, Springfield, Ohio; J. and J. Cash, Inc.; H. K. Ferguson Engraving Co., Cleveland, Ohio, and the A. C. Spark Plug Co. have located in Brantford, demonstrating the way in which a protective tariff tends to draw industries into the country. The products of Brantford industries are almost too numerous to mention but include agricultural implements, binder twine, biscuits, boots and shoes, carriages, cigars, emery wheels, enamelling ovens, engines, hosiery, kitchen cabinets, motors, paints, phonographs, pumps, refrigerators, scales, sleighs, sporting goods, stoves, tractors, underwear and many other useful articles.

Some City Dates

Brantford was incorporated in July, 1847, just three years after the Waterous industry was established. The first council meeting was held on September 9, 1847. By October 5, Brantford had built its first town hall. In 1851 the county buildings were erected in Brantford. Industry expanded, and when, in 1854, the Buffalo, Brantford and Goderich Railway reached the town, its place on the map was assured. Brantford became a city on May 31, 1877. Its history affords a very striking illustration of what industrial development when guided by the hands of loyal citizens can do to build up a community.

The story of the Waterous industry is typical of that of several other Brantford industries and in fact of many industries all over the Dominion.

The Company Paper's Part in Improvi Industrial Relations

By J. L. CHARLESWORTH

EFFICIENT work, contented employees, safety and a low labor turnover are conditions which every modern manufacturer is anxious to secure. In fact, once they are secured the problem of industrial relations may be considered as solved. At these ultimate results all welfare work is aimed, and in such work the company paper plays a part by no means unimportant.

There are many schemes calculated to improve the internal conditions of a plant; the company paper should be the consolidation of all the rest. Publicity should be given in it to everything that is done for employees. If one is promoted for good work the others should know about it. When a group insurance scheme is adopted, it should be explained in the plant organ. In short, everything that employees can be told about the company's affairs should be made known to them, and such information can best be disseminated by means of the company paper.

Canadian Plant Organs.

That Canadian manufacturers have not overlooked this means of improving industrial relations is evidenced by the number of companies that publish weekly and monthly papers for their employees. The latest is the Steel Company of Canada, whose publication, the *Stelco News*, was started last July. Other firms in the list are the Laurentide Company, the Goodyear Tire & Rubber Company, the Spanish River Pulp & Paper Mills, and the Brompton Pulp & Paper Company.

In view of the fact that the usefulness of a company paper has been demonstrated both here and in other countries, it may be of value to consider what the objects of such a journal are, and how they are best achieved.

In the first place, such a publication should be the outcome of other welfare work. It can do nothing alone. If workmen have reasonable grounds for thinking that the company is not treating them fairly, the conditions of which they complain must be rectified before the company paper can exert any influence. On the other hand, if discontent is spreading without any valid reason, the work that the plant organ can do towards putting matters in their proper perspective is invaluable.

As with any journalistic enterprise, an editorial policy must be fixed upon before a line is printed. In answer to an enquiry, the editor of *Stelco News*, Mr. S. E. Lebrocq, sent a statement of the objects of his paper, that is typical of the policy adopted by most firms that embark on such an undertaking.

> *"May I tell you something else that I think needful to a good publication for distribution among one's own people? It must emanate from the head of the firm, from the management, naturally. And the biggest, broadest-minded man you have shouldn't be too busy, nor his time thought too valuable, to be spent in this direction. But along with that there should be secured, I think, the viewpoint of at least one of the humblest workers you have. And the message of the one should be interpreted in terms of the other.*
>
> *"I don't quite know how this can be done; I believe with a sincere effort it can be done. It might be that in some dull, routine work where the monotony would give the characteristically workman's viewpoint that I mean, you might find someone with just enough ability to express the message of the management in a way that would make it pleasing and convincing to his fellow-workers. Or you may need a real editor with the gift of good-fellowship sufficiently developed that he can make friends with your factory people, win by genuine merit their confidence, learn their problems, and in this way not only carry your message to them, but theirs to you."*
>
> —*Miss Margaret Wade,*
> *Editor of "McClary's Wireless."*

"*Stelco News*," he says, "is published for, and in the interest of the employees of the Steel Company of Canada, Limited, and the same is to promote a closer relationship between working units and to establish a spirit of good fellowship among co-workers.

For Esprit de Corps

"We believe that employers of labor are beginning more and more to realize that the success of their undertakings is largely contingent on the *esprit de corps* existing in their organization, and to create this condition we know of no means more effective than the publication of a plant organ.

"The aim of this publication should be to represent every worker in the plants, and make them realize that THEY constitute the Company—that their interests are also the Company's interests. The publication should also be of an educational character. If the Company is a manufacturing one paper should be the means of edu the workers in the products ma tured, while at the same time it su a very effective medium for propa along accident prevention and fir vention lines."

Another matter, that arises at t ginning of such an enterprise, i selection of an editor. In the opini persons whose intimate association the work of bringing out plant o enables them to speak with auth success or failure, primarily depen him. "Of one thing I am absolutely vinced," writes W. McE. Bowden, o Laurentide Company, "That is th order that a company paper, run fo benefit of the employees, be a succe must be handled by a man of ima tion and enterprise who has a good of personality and a good deal of int in his fellow-workers. The ordinary of newspaperman cannot fill the bi

Value of Variety.

So far the establishment of most pany papers runs on parallel lines. when the policy is settled and the torial chair filled by a man of ir gence, imagination and sympathy possibilities for variety are inf Variety is an indispensable attribu a plant organ; everything printed should be read by a majority of th ployees at least, and the editor c afford to neglect any measure that further this aim.

The *Spanish River News*, publish Sault Ste. Marie, for employees o Spanish River Pulp and Paper Mills made a specialty of printing items will attract its readers' attention. I number contains some piece of that will be of importance to son the workmen. Now it is a contest, the announcement of a picnic or d The idea is to make the paper of value, so that one looks to it for n

Personal items, if properly han assist in gaining readers for the p Everyone likes to see his name in and the harmless vanity can be ca ized. Let the employee understand good work will receive recognition, he will try to deserve it. Tell the when he gets married, when he acq a Ford, or a new baby, and he will more than a cog in the machin healthy self-respect usually conduc good work.

Some other means of making the organ a live factor were recently lected by *Factory* from letters of

correspondents. One company printed a picture showing their print shop in one of their issues. Workmen, naturally curious about mechanical processes which affect them directly, were anxious to learn about the way their own paper was brought out, and the company found that they were twice as eager to read it as before.

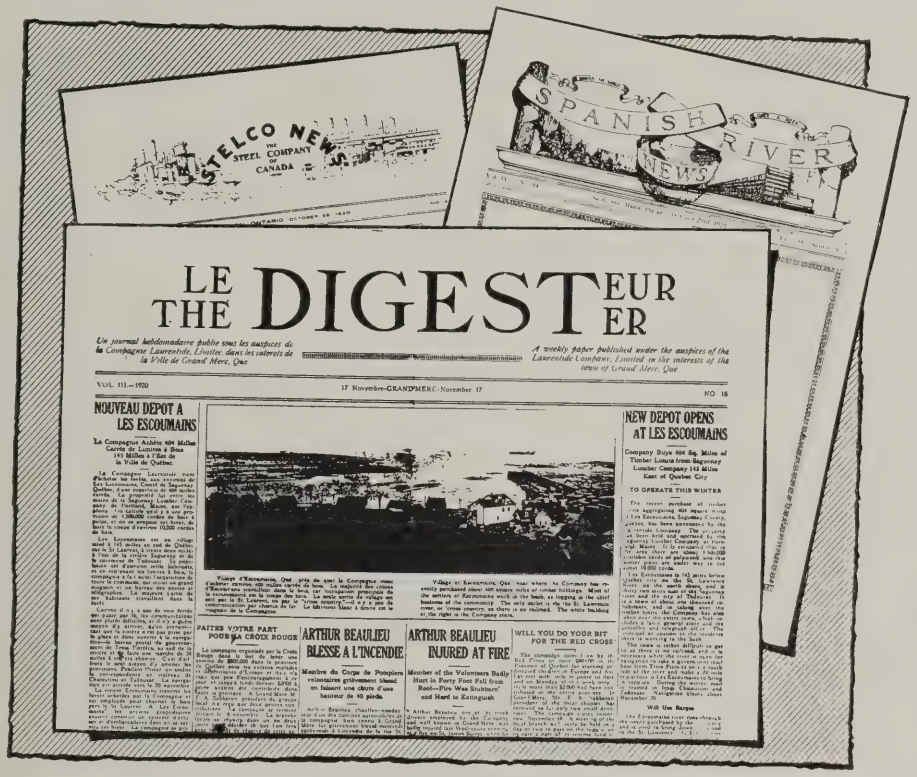
Another firm offered to bind the issues for one year provided each one was preserved. Many of the employees kept all their papers carefully and watched for the announcement telling how they would be bound. Instructions were printed in the paper telling how copies were to be prepared for binding, and a number of employees took advantage of the offer.

The Laurentide Company, who practically created the town of Grand-Mère, Quebec, have a highly-developed system of industrial relations. It includes homes for employees, a library, a gymnasium, a club house and golf links. With the numerous activities implied by these and other institutions the company paper finds no shortage of news material. One of its features is striking and may commend itself to other manufacturing firms who employ foreign labor. The Laurentide Company have in their employ both French and English workmen. Their paper, *The Digester* or *Le Digesteur*, is printed in both languages, alternate columns being used for the same news. By delicately emphasizing the quality of both languages, the danger of racial jealousies is avoided, and every reader of the paper has a chance of improving his knowledge of French or English by comparing the printed translations.

The services which the company paper can render are numerous. As stated above, it should be the consolidation of other welfare schemes aimed at securing a contented and efficient personnel. The open discussion of all problems affecting such an aim should be encouraged. Every worker should be invited to contribute suggestions and constructive criticism. If this is done, if employees feel that fairness to all is the company's object, they will not listen ready to Bolshevistic agitators. The copy sent in may be ungrammatical, illogical, badly written; but even in the rubbish the editor may find something worthy of notice, while in a large plant there is certain to be someone who will contribute valuable material. Here, by the way, is one reason why a good editor is needed. Rejecting manuscripts sent in by those whose co-operation is a vital necessity calls for almost superhuman tact.

Then there is the social side of the worker's life which can be assisted in many ways. It is not logically the company's business what a man does with his spare time, but if some control can be enforced there are practical advantages to be gained. When the company can provide means for wholesome recreations they should be well advertised in the plant organ. Men should be encouraged to try for the company baseball team or attend the weekly dance. Everything that links up the workman's life with the company should be given space in the paper, for through such devices labor turnover is decreased. More than that, they go far towards assuring a future labor supply, since a man who feels that he has been successful in the company's service will bring up his children to enter it also.

A suggestion of what may be done by the plant organ in fostering healthy recreations is given by a writer in a recent issue of *Factory*. "The management of one large industrial plant in an eastern city," he says, "is a firm believer in the value of an out-of-door life for itself and and for people working for the company. It believes in encouraging the workers to get outdoors more and, with this object in view, space has been devoted regularly in the shop paper to out-of-door sports. Each week a short pleasure trip which may be taken on foot, in motor cars or by electric trains to nearby districts is described. The route is carefully noted so that the strangers among the workers cannot be misled, and is effectively described to induce the workers to take the trip.



"With each weekly selection, a photograph of some striking spot or an attractive building is included. These photographs are usually secured from men in the plant who make a practice of taking such trips and taking snapshots. Very little difficulty is met in securing these photographs, as the owners are usually glad to have them printed."

In most modern plants, the great message from management to employee is safety, and in carrying out this idea the company paper justifies its existence. There are several obvious advantages in using it as a medium for such propaganda, of which the chief one is probably the wide scope for variety. There is little doubt that everyone in the country has heard the slogan, "Safety First." Yet accidents, preventable accidents, continue to happen. The reason why the slogan so often fails in its purpose is that it is too frequently no more than a slogan. Put up a poster showing a gory hand above a machine, and the operator will be careful—for perhaps a week. Then the poster has become part of the scenery, and no longer carries an effective message.

The company paper, conducted along the lines described, so that every hand in the plant looks to it for guidance, can make the idea of safety a living factor for its readers. The editor's originality can find a different way to present his case with every issue. One week a poem or cartoon may make the desired impression, at another time the spirit of rivalry may be invoked by a contest between departments for a no-accident record. If a challenge trophy can be competed for, so much the better.

Does the company paper pay? The consensus of opinion seems to indicate an affirmative answer; answers to enquiries sent to several firms who publish such journals, with one exception, showed that

(*Concluded on page* 98.)

Some Canadian Company Papers

The Stelco News, The Digester, and The Spanish River News

News and Views of the Association

There will be found each month in this department a record of the various activities of the Canadian Manufacturers Association during the preceding month. The information is supplied to INDUSTRIAL CANADA officially, and all members of the Association are urged to acquire the habit of reading and checking over the contents of the department carefully in order to keep themselves posted on the work of the Association

Executive Council Met in Montreal

AT the meeting of the Executive Council held in the Windsor Hotel, Montreal, on October 28, Thomas Cantley, Nova Scotia Steel & Coal Co., Limited, New Glasgow, and Thos. R. Deacon, Manitoba Bridge & Iron Works, Limited, Winnipeg, were elected members of the executive committee, replacing Thomas Findley, Massey-Harris Co., Limited, Toronto, and H. I. Thomas, Ottawa, whose three-year term of office had expired.

Approval was granted to the application of members in Kitchener and other points in Waterloo County for authority to form a branch to be known as the Kitchener and Waterloo Branch of the C.M.A

Authority was granted for the foundation of two new sections—the Structural Steel Section and the Clay Products Section of Vancouver Island.

A resolution was passed giving instruction that suitable letters of sympathy be prepared, signed by the president and despatched to the relatives of the late E. G. Henderson, ex-President, and F. H. Whitton, Chairman of the Commercial Intelligence Committee.

Big Electrical Project for Australia

W. C. CHAPPELL, assistant engineer to the Electricity Commissioners of the State of Victoria, Australia, will be at the head office, C.M.A., from December 5 to December 12, in connection with an important electrical development scheme in Australasia. The Electricity Commissioners are shortly undertaking the installation of a plant of great magnitude at Morwell, about seventy miles from Melbourne, for generating cheap electrical power from immense deposits of brown coal. It is estimated that the cost of installation and equipment for the conveyance of the current will be in the neighborhood of $15,000,000, so that the importance of Mr. Chappell's visit to Canada can be readily realized.

Tenders for the necessary plant close at Melbourne on February 24, 1921. There will be a generating plant at Morwell capable of an output of 50,000 kws. in the first stage and later of being developed up to a maximum of 150,000 kws. The power will be conveyed in the first instance to Melbourne by means of a transmission line consisting, in the first stage, of one line of towers with two 3-phase circuits each having a capacity of 25,000 kws. Alternative tenders are being invited for the conductors of copper and aluminum. The first terminal station to be proceeded with will be that at Newport, near Melbourne, where power will be reduced in voltage to 22,000 volts.

For the convenience of Canadian manufacturers, copies of the various specifications may be seen at the Toronto and Montreal offices of the C.M.A. So far as electrical equipment is concerned, the tenders comprise about the largest value ever sent to Canada from overseas. It is to be hoped that Canadian manufacturers will do all in their power to secure some of this business for Canada. Through the efforts of D. H. Ross, Canadian Trade Commissioner, Melbourne, the procedure has been simplified for Canadian manufacturers so that a special effort should be made to get the business.

Our Branch Chairmen
for 1920-1921

Norman Alfred Yarrow
Chairman, Victoria, B. C. Branch

MR. YARROW is managing director of Yarrows, Limited, ship repairers, shipbuilders, engineers, iron and brass founders. He was born in London, England, and is a son of Sir Alfred F. Yarrow, Bart. After receiving his education, he served a five years' engineering apprenticeship, on the termination of which he visited a large number of the principal engineering centres of Great Britain, Europe, America and Canada. In January, 1914, he came to British Columbia and took up his present work. Mr. Yarrow is an associate member of the Institution of Naval Architects, London; the Engineering Institute of Canada, Montreal; the American Society of Mechanical Engineers, New York; and the Society of Naval Architects and Marine Engineers, New York.

Milling Companies Form New Association

WITH the passing away of the Canadian Wheat Board, representatives of the milling concerns of Canada have formed an organization to be known as the Canadian National Millers' Association. The principal object of the new association will be to do everything possible towards increasing the country's flour export. It is stated that at the present time the annual output of flour from Canada is 8,000,000 barrels, whereas it should be in the neighborhood of 20,000,000 barrels.

Another object of the association would be to seek to improve milling methods, not only in the matter of grinding flour and disposing of it, but also in regard to the adoption of a proper system.

The first officers of the new organization are: President, Brig.-Gen. A. E. Labelle, St. Lawrence Flour Mills Company; 1st Vice-President, George A. McDonald, Quaker Oats Company; 2nd Vice-President, J. E. MacFarlane, Western Canada Flour Mills Company; Assistant Secretary, W. Sanford. On the directorate are: C. E. Austin, Interprovincial Milling Co., Saskatoon, Sask.; W. A. Black, Ogilvie Flour Mills Co., Montreal; D. A. Campbell, Maple Leaf Milling Co., Toronto; Alex. L. Fowler, Fowler Milling Co., West St. John, N.B.; Geo. W. Glen

Ellison Milling & Elevator Co., Lethbridge, Alta.; G. A. Gray, T. H. Taylor Co., Chatham, Ont.; J. E. Hall, Vancouver Milling Co., Vancouver, B.C.; C. Hunt, Hunt Bros., Ltd., London, Ont.; W. W. Hutchison, Lake of the Woods Milling Co., Montreal; A. C. McLeod, Canadian Cereal & Flour Mills Co., Stratford, Ont.; J. A. McDonald, McDonald & Robb, Valleyfield, Que.; R. J. McCullough, Geo. McCullough & Sons, Souris, Man.; C. Ritz, Robin Hood Flour Mills Co., Montreal; Hedley Shaw, Maple Leaf Flour Mills Co., Toronto; N. C. Sinclair, Empire Flour Mills, St. Thomas, Ont.; R. A. Thompson, Lynden, Ont.; C. B. Watts, Dominion Millers Association, Toronto.

W. Sanford Evans, who was Secretary of the Millers' Committee, with headquarters at Winnipeg, has been invited to become secretary of the new body, the executive of which will convene shortly to complete the details of permanent organization.

Visitor from Australia After Agencies

AN interesting visitor at head office in November was Arthur Kidman, of Sydney, Australia, who came with a letter of introduction from D. H. Ross, Canadian Trade Commissioner, Melbourne, Australia. Mr. Kidman was en route from Australia to London, where he has a branch office. He is engaged in both the export and import business, shipping such products as frozen and canned meats, rabbits, butter, tallow and dried and canned fruits. While here he asked to be put in touch with Canadian manufacturers of cider, condensed milk, electric washers, vacuum cleaners, linoleum, maple syrup, cocoa and chocolates and was furnished with lists by the Commercial Intelligence Department. Mr. Kidman will spend the winter in England and will return to Canada about next March.

Much Correspondence With West Indies

THE Commercial Intelligence Department has had numerous letters of late from merchants and importers in the British West Indies, asking for the names of Canadian manufacturers who would be interested in West Indian representation. This movement is the direct result of the new Canada-West Indian trade agreement, which presumably will come into force next year. It has already been ratified by Trinidad and Jamaica and will doubtless be ratified at the coming session of the Dominion Parliament. Meanwhile the merchants of the British West Indies, who are reported to be enjoying great prosperity at present, are evincing a strong desire to trade with Canada and are anxious to secure agencies for various lines of manufactured goods. Inquiries have already come for the names of manufacturers of hosiery, underwear, shirts, overalls, hardware, enamelware, dishes, wall paper, paper bags, wrapping paper, brooms, brushes, chairs, cut glass and glassware.

New Officers are Elected By Auto Makers

R. S. McLAUGHLIN, president of General Motors of Canada, Limited, Oshawa, Ont., was elected president of the Automotive Industries of Canada at a general meeting held in Toronto on November 10th. W. T. Samson, manager of the Gananoque Spring and Axle Company, Limited, was elected vice-president.

Of the fifty automotive companies which comprised the association in Canada, thirty sent representatives to the meeting. A feeling of optimism and confidence in the automotive field prevailed among the members, who admitted that although sales were dull at present the outlook for 1921 was bright.

The following directors were elected: Gordon H. McGregor, manager Ford Company of Canada; C. H. Carlisle, manager Goodyear Tire & Rubber Company of Canada; J. M. Taylor, president Taylor-Forbes Company, Guelph; T. A. Russell, president Willys-Overland Company, Toronto; Robert Gray, president Gray-Dort Company, Chatham; R. E. Jamieson, president Dominion Rubber Systems, Montreal; and W. A. Rowland of the Steel Company of Canada, Hamilton.

Toronto Branch Gives Many Scholarships

THE annual commencement of Toronto Technical Schools was held in the auditorium of the Central Technical School on the evening of Friday, November 5th. Dr. A. C. McKay, principal, in an introductory address, stated that the technical schools of the city now have a total registration of 8,626 students, and that the Central Technical School has given vocational training to 2,900 returned men.

Dr. F. W. Merchant, Director of Technical Education in Ontario, delivered an address on the advantages of technical education, outlining the progress of technical education in the province and complimenting Toronto on possessing the finest technical high school on the continent.

Short addresses were delivered by Dr. John Noble, chairman of the Board of Education; George Brigden, chairman Educational Committee of the Toronto Branch of the C.M.A.; Controller Cameron, and Mr. R. J. Stevenson, of the Advisory Industrial Committee.

Mrs. W. E. Groves, having taken the chair, 250 prizes, diplomas and scholarships were presented to those pupils who topped their years and completed their courses. Fifty-three scholarships, totalling $1,325, were presented by Mr. George Brigden, representing the Toronto Branch of the C.M.A., in addition to $200 given by Toronto Branch as prizes to the Evening School. The following is a list of the $25 scholarships donated by the manufacturers for the year 1920:

Name of Donor.	Scholarships.	Am't.

Proposed Visit to Orient Next March

THE Vancouver Board of Trade, which laid plans for a visit by several of its members to the Orient last fall, and which was unable to carry out the undertaking at the time because of lack of steamer accommodation, has again decided to attempt the trip. Tentative reservations have been made for twenty persons on the *Empress of Russia*, sailing from Vancouver next March. The proposed itinerary includes the principal cities of China, Japan and Manila, returning via Honolulu and San Francisco.

The proposal to have a number of Canadian business men visit the Orient was mooted in 1919 and an effort was made at the time by the C.M.A. to interest a number of the larger boards of trade in the idea. It was the plan then to have each board, together with the C.M.A., send a representative. The proposal, however, did not receive much

support and was dropped. Subsequently the Vancouver Board of Trade revived it on its own account.

There is no intention of limiting next year's party to Vancouver business men. In fact, it is understood that the promoters of the trip would welcome eastern representation. If any members of the C.M.A. contemplate a trip to the Orient next year, they are requested to send their names to the head office of the Association.

Told About the Physician in Industry

QUITE a few members of the Industrial Relations Association of Toronto, a new organization in of Toronto, a new organization in which several Toronto members of the C.M.A. are interested, together with a number of industrial nurses, met in the Canadian Foresters' Hall on Monday, November 8, to hear Dr. Robert E. Gaby speak on the subject of "The Physician in Industry."

Dr. Gaby is the consulting physician for the Hydro-Electric Power Commission of Ontario, and was well qualified to speak on this subject. In the course of his remarks he showed how large industrial plants were finding it more and more a help to the industries to have well equipped medical and surgical laboratories attached to or in the vicinity of each establishment, where the best of attention could be given to employees in need of assistance or for physical examinations when required. Rest rooms and the need for the nurse in industry was touched upon, after which quite a discussion was entered upon by the members present as to the advantages and disadvantages of the various systems in use for looking after the well-being of employees.

D. S. Curtis, office manager of the Office Specialty Manufacturing Co., followed with a very interesting talk, illustrated by lantern views, showing and explaining the card record system in use in various employment departments.

Thomas Bengough, vocational director, Toronto Board of Education, was also in attendance, and in a brief few minutes gave an interesting synopsis of what his work would be in connection with the gradual education of the child for its entry into industrial and mercantile life.

Minimum Wage Board for Ontario

R. A. STAPELLS, managing director of the McElroy Manufacturing Co., Toronto, and Mrs. H. W. Parsons, Secretary of the National Council of Women, two of the nominees of the Ontario Division, C.M.A., for the new Minimum Wage Board of Ontario, have been appointed to the Board, Mr. Stapells for two years and Mrs. Parsons for one year. The chairman of the Board is Prof. J. W. Macmillan of Victoria College, who was previously chairman of the Manitoba Board. Labor's representatives are H. G. Fester, Secretary of the Hamilton Trades and Labor Council and Miss Margaret Stevens of the Toronto Garment Workers' Union.

Mr. Stapells, who represents the C.M.A. on the Board, is a former President of the Empire Club and is a member of the Council of the Toronto Board of Trade. He was organizer of the Navy League Campaign in Toronto last year, and is both energetic and public-spirited.

Ontario Division's Efforts to secure Power

OWING to the serious shortage of power experienced by the industries of the province, the Power Committee of the Ontario Division made vigorous efforts to secure relief for the industries during the past month.

On November 3rd the Power Committee organized a representative deputation, which waited upon Premier Drury and the Cabinet at the Parliament Buildings, when the following resolution was presented by Mr. W. H. Shapley, chairman:

"Whereas there is a serious shortage of electric power throughout the Province of Ontario;

"And whereas such shortage of power is aggravated by persistent and uncertain shut-downs in numerous industries, causing serious disturbance to contracts, immeasurable loss in production and widespread confusion, as well as broken time and consequent loss of wages to workers at a period of the year when they are least able to bear it.

"Therefore, be it resolved, That the Power Committee of the Ontario Division of the C.M.A., representing over 2,000 industries in the Province of Ontario, earnestly appeal to the Provincial Government forthwith to take all ne sary action to the end:

"(1) That the 25,000 h.p. which Toronto and Niagara Power Comp are believed to be capable of develop from water which is the property the province, and for which they h the machinery to do this, shall be g erated and made available to the Hyd Electric Power Commission of Onta for the use and benefit, in particular, the industries in this province.

"(2) That any other available po be generated and supplied in the v that will give the greatest possible lief and benefit to users of Hydro powe

It was shown that the present po shortage in Ontario is causing the ma facturers of the province a loss wh has been estimated at $3,000,000 a mont

It was stated on behalf of the ma facturers that the only source fr which power was immediately availa according to their information, was private company operating at Niag Falls. This company was reported be able to develop some 25,000 h.p. m than it is at present doing. Furth the company has in Toronto a ste plant capable of developing some 000 h.p.

In addition to the power that mig be made available from the sou just mentioned, there were three cons erable blocks of power which are n being exported from the province:

(1) The Hydro-Electric Commission exporting 50,000 h.p. under a contr which it took over from the Onta Power Company.

(2) The Canadian Niagara Pow Company is exporting 36,000 h.p.

(3) The Toronto Niagara Pow Company is exporting 13,500 h.p.

By a Dominion Act, known as "T Electricity and Fluid Exportation A passed in 1907, the exportation power out of Canada was forbidden cept on license granted by the Gov nor in Council. Since the passing this Act in 1907 all three companies, cording to our information, have c plied with the act and secured licen covering their exportation of pow The Ontario Power Company and Canadian Niagara Power Company, h ever, take the position that this does not give the Dominion Governm the right to forbid the further exp of power by these companies, in v of the fact that the contracts un which these companies are export were made before the act was passed. n this connction, it may be noted that contracts made by these two generat companies with their respective tra mission company or consumers, as cae may be, all contain clauses prot ing the generating companies in event of any action by the Governm of Canada interfering with the furt exportation of power. In the case the Toronto Niagara Power Compa contract for the export of power, argument in question does not apply

Executive Council

Owing to the way in which the Tariff Inquiry has absorbed the attention of officers and officials of the Association of late, no meeting of the Executive Council was held in November. The next meeting will take place in Toronto, on December 16, when a full attendance of members in expected.

he contract was made since the passng of the act of 1907.

Finally, it was pointed out that the Royal Commissioner (Sir Henry Drayon), appointed by the Dominion Govrnment in 1917, reported against the dvisability of cancelling the licenses or the export of power, but not beause of any doubt as to the right of he Dominion Government to do so nder the 1907 act, but only because the merican users of power were doing aluable war work and would be seriusly hampered by any deprivation of ower at that time.

The Premier assured the deputation at the substance of the resolution as, in fact, already receiving the conderation of the Government, and that eir efforts would be continued until a tisfactory solution was secured.

November Activities of The Quebec Division

By R. W. Gould

Secretary, Quebec Division

THE Quebec Division, at the very outset, desires to extend to the ther divisions and members of the sociation in other parts of Canada the ason's greetings and the wish that the "nouvelle annee" will herald to all a renwed period of prosperity and happiss.

The Ministerial Tariff Commission has ne and gone; our members are satisfi, and it would appear that the Commsion itself was satisfied, with what it ceived in Quebec, Sherbrooke, Three Rers and Montreal. A greater volume ofevidence was presented in Montreal thn in any other part of Canada yet vi ted. During the tour of the Commsion throughout the Province of Quebe a very strong sentiment in favor of mderate protection was found on all sis. Farmers, laborers, professional me, citizens and industrial organizations all came forward and spoke in favor of a fisl policy of protection.

The Montreal Branch presented over thiy briefs in all of various groups, and at last 80 per cent. of the time of the Commission, during the five days it sat in Montreal, was taken up in hearing the arguments.

The members of the Quebec Division are particularly appreciative of the effort of the officials from Head Office who came to Montreal and other centres in the province, where briefs were being presented, to assist them in the preparation of their data for the Commission.

In the midst of the presentation of briefs and the storm of tariff argument the Montreal Branch held its quarterly luncheon meeting. This meeting, which was held on November 16th, in the Rose Room of the Windsor Hotel, was addressed by Roger W. Babson, founder of the Babson Statistical Organizations. He took as his subject, "The Outlook for 1921," and more than 400 of our members heard his address. So striking were his prognostications for business conditions in 1921 that it has been decided to have the address printed and distributed to the members of the Quebec Division. In this connection, should any of the members of the outside divisions desire a copy of his address I will be pleased to see that one is mailed on receipt of the request.

The luncheon had the biggest attendance of any similar function held in the history of the branch, and was, from every standpoint, a splendid success. Mr. Babson has been invited to address the Branch again next year. This was the only address delivered by Mr. Babson in Canada, and in view of business conditions at present obtaining in this and other countries his address struck a note of exceptional interest.

November was a month of stirring events in the activities of the Montreal Branch. On November 10, the Canadian Board of Railway Commissioners sat in Montreal for the purpose of hearing local evidence with respect to the application of the Bell Telephone Company for increased rates and the introduction of the measured service system in several of the larger centres served in Canada.

B. W. Coghlin, vice-chairman of the Montreal Branch, presented a brief to the Commission setting forth the views of the Branch in the matter. The brief contained figures secured from questionnaires sent out by the Branch to its members, which showed that the measured service system would increase costs for telephone service from 5 to 580 per cent. The Branch, however, did not oppose an increase to the Bell Telephone Company on the flat rate basis, as might be shown necessary to the satisfaction of the Railway Board.

A meeting of the local executive was held on November 9th, when matters of interest were discussed and plans were completed for the reception of the Ministerial Tariff Commission.

Goes to Ingersoll

John F. Mackay

MR. MACKAY, who was last year's chairman of the Publishing Committee, has recently received the important appointments of vice-president and general manager of the John Morrow Screw and Nut Co., and vice-president of the Ingersoll File Co., Limited, removing from Toronto to Ingersoll, on December 1. Mr. Mackay was for some three years secretary-treasurer of the Russell Motor Car and Willys-Overland organizations, Toronto. Prior to that he was for fifteen years business manager and treasurer of the Globe, Toronto, his previous newspaper training in Western Ontario and Montreal having fitted him for the success he attained there and subsequently in the industrial undertakings with which he has been identified.

Foreign Circulation of Trade Index

THE foreign circulation of the 1920-21 edition of the "Canadian Trade Index" has now been completed. This year, the distribution among foreign firms has been considerably increased, and will amount to over 2,000 copies. The English and French edition has been supplied to over 1,600 firms and organizations, and the Spanish edition of this book has been distributed throughout Cuba, Mexico, Central and South America and Spain. Owing to the increasing trade, the circulation of the British West Indies and Cuba has been enlarged, and, as a result of a request from the Mexican Commercial Representative in Canada, a number of books were forwarded to the principal Chambers of Commerce and Government Purchasing Departments in Mexico.

The following statement will give an idea of the extent of the distribution in various countries:

British Isles and Europe	500
United States	400
Australia, New Zealand and South Africa	400
British West Indies, British Guiana and Cuba	175
Newfoundland	95
Orient	100
South America, Central America and Mexico	400

Inquiries from foreign countries are coming in from time to time, and it is estimated that the total foreign circulation will approximate 2,100 copies. Care has been taken to see that the "Index" has been placed in the most advantageous way: it has been supplied not only to reliable import and export houses, departmental stores, Government purchasing departments and railroads but also to Canadian trade commissioners, British consuls, banks, trade organizations and chambers of commerce in all the above countries.

Tariff Department Bulletin

Announcements Regarding Tariff Matters, Including New Drawbacks, New Export Requirements and Excise Tax Rulings

Drawback in Respect of Oleomargarine

Regulations established by Order in Council of the 1st of November have been issued by the Department of Customs (vide Memo. No. 2433-B), providing for drawback of 99 per cent. of the duty paid on imported materials, not including machinery, used on and after September 1st, 1920, and prior to September 1st, 1921, in the manufacture of oleomargarine.

Drawback on Steel Sheets Used in the Manufacture of Stampings for Automobiles

Regulations established by Orders in Council of the 9th of August and the 26th of October have been issued by the Department of Customs (vide Memos. 2414-B and 2430-B) providing for drawback of 99 per cent. of the duty paid on imported steel sheets, hot or cold, rolled or coated with lead or a combination of lead and tin, No. 16 gauge and thinner, but not thinner than No. 24 gauge, measuring from twenty to fourty-two inches in width and from fifty to one hundred and twenty inches in length, used after the 31st of July, 1920, and prior to the 1st of August, 1921, in the manufacture of stampings for automobiles.

Regulations Regarding the Importation of Foreign Wool and Hair

The Department of Customs has notified its collectors that the regulations issued by the Department of Agriculture governing the importation of wool and hair do not apply to American domestic wool. Domestic wool originating in the United States may be imported into Canada without disinfection.

Members desiring copy of the regulations which were established by Order in Council on the 12th of August last may obtain same on application to the manager of the Tariff Department.

Inspection of Preserved Fruits, Vegetables and Milk—New Export Requirements

On the 27th of August last an Order in Council was passed on the recommendation of the Minister of Agriculture, establishing certain regulations governing the inspection of preserved fruits, vegetables and milk. The regulations apply to fruits and vegetables, fruit and vegetable products, canned, bottled, dried, evaporated or otherwise preserved for food; and to milk, condensed, dried, evaporated or otherwise preserved for food.

The Order in Council contains provisions respecting the marking of containers in which fruits, vegetables, milk or other articles prepared for food are placed; also provisions respecting certificates of inspection, which must accompany all shipments of such food products for export out of Canada and respecting the form of declaration to be used with imports of these commodities coming into Canada.

The new regulations are practically the same as the regulations which were previously in force. The principal change is that on and after January 1st, 1921, shippers who have canned or evaporated fruits or vegetables or fruit or vegetable product, or milk condensed, evaporated or dried for export, are required to make application in writing to the Veterinary Director-General or his duly authorized agent for inspection and "Certificate of Export." The prescribed forms are set forth in the regulations.

Copies of the regulations, which are set forth in Department of Customs Memorandum 2423-B, may be obtained on application to the Manager of the Tariff Department.

Bosch Magnetos Prohibited in Australia

The Commonwealth of Australia has prohibited the importation into Australia of magnetos bearing the word 'Bosch." The authorities in Australia are strictly enforcing the prohibition, and exporters should take care that cars and engines sent to Australia are not fitted with magnetos coming within the terms of the proclamation.

Excise Tax Rulings

Fractional Sales.—The Department of Customs and Inland Revenue advises that it has been decided to adopt the commercial practice in dealing with the amount of sales tax payable on what are known as "Fractional Sales."

The ruling of the Department reads as follows: "The tax shall be computed upon total value of any sale. Where amount of sales tax thus computed results in a figure containing a fraction of one cent and the fraction is less than one-half cent, such fraction will be disregarded; but where the fraction is one-half cent or more, the same shall be treated as one cent. When the amount of tax on any sale is less than one-half cent the tax is collectible. These regulations are effective from the first of December, 1920.

Licenses.—One Firm—One License. The Department of Customs and Inland Revenue states that a Sales Tax license taken out on behalf of a firm will cover all of the branches of the firm which are operated under the firm name. Similarly, when a firm takes out a Manufacturers' license such license will cover the firm's branches. Branch offices do not require separate licenses.

Returned Goods.—In the October issu of INDUSTRIAL CANADA it was stated th the Department of Customs and Inlan Revenue had cancelled the former rulin respecting the taking of credit for sal tax paid on goods subsequently returne and that in future credits in respect returned goods could only be obtaine by way of refund claim to be filed wit the Department of Customs and Inlan Revenue every three months. It has no been made clear that the new ruling a plies only to credits for Luxury Taxe and accordingly where a firm has paid the Government a Sales Tax or Manufa turers Tax, or both, on goods, and th goods are subsequently returned, th firm may take credit for the amount question on its next return.

Sales Tax re Provincial Government and Government Institutions.

The Department of Customs and Inlan Revenue has issued the following instru tions to its Collectors with respect to th operation of Stamp Tax and Sales Ta in connection with Provincial Gover ments and certain Government instit tions. The instructions read as follows:

Although there is no provision in th Special War Revenue Act, 1915, exemp ing the provinces from the payment taxes, it is a recognized principle tha such revenue laws do not apply to th Crown, and therefore the Sales Tax not applicable to sales made direct provincial governments for use thereof

Where *Crown Funds* are solely involve the stamp tax does not apply to cheque issued by Provincial Governments, othe wise it applies.

Provincial Governments are exem from Sales Tax as respects purchases liquor made for use of said governmen and not for resale—for example, spiri purchased by a Government vendor, bei for resale, will be subject to Sales Ta Exemptions apply only on sales by a m chant direct to the Government, but n on merchandise purchased by said m chant even if intended for resale to t Government.

No Sales Tax is payable on purcha made for the use of Government jails Provincial Departments of Public Wor and as regards sales made to milit hospitals or the Department of Soldie Civil Re-Establishment the tax does apply where *Crown money* is solely volved; nevertheless, if sales are made such institutions to patients or soldi the tax is applicable.

Sales Tax is collectible on purcha made for Provincial Government t phone systems. Provincial railroads all other separate bodies corporate similar character.

In all cases where conditional exe tion is claimed, orders placed for go must bear a certificate from the Pro cial Government that the goods so chased are for direct use by such Pro cial Government and not for resale.

The Merchants Bank of Canada

Complete Organization of 399 Branches across Canada at the service of Canadian Trade and Industry and the Canadian Farmer

In addition to its complete service across Canada, The Merchants Bank of Canada is helping in the development of Export Trade, through its offices in New York and London, England.

Banking Connections throughout the World

The Power of Punctuality

The Builder of Men, of Better Homes and Vast Industries

Punctuality is a most important factor in the building of men as well as of industries. It is the means of completing mighty tasks according to schedule. Punctuality builds nations.

Punctuality conserves time, which is an active income-yielding property; it builds homes and increases our pleasures and comforts. Punctuality eliminates waste. It helps us to capitalize on our efforts and ambitions.

Punctuality means much to Canada—more than ever before. Time is constantly increasing in value. Economy of the hour is as essential as economy of the dollar. An hour wasted to-day is a great loss to Canada.

Time recording is essential to labor and to capital. An accurate, simple and impartial system is necessary to equalize time.

Wherever people work together it is a vital necessity that accurate printed records should be kept. To obtain accurate knowledge of costs, it is essential that a printed record of the starting and the stopping time of each job be secured. We have been manufacturing International Time and Job Recorders for 30 years. This accumulated experience has enabled us to place upon the market recording equipments of mechanical accuracy and efficiency that cannot be equalled elsewhere.

Every Man His Own Time Keeper— Every Man Satisfied and Every Man Right

That's a condition that makes for contentment and big production. Every employee has his own number and punches his time in clear, accurate, unchangeable figures on the time sheet inside the Recorder.

International Dial Recorder

This is the fastest time keeping system in the world. Has automatic morning, afternoon and overtime shift, automatic day to day shift and shows late arrivals, early leavers and overtime in red. This last feature is a big convenience to the cashier as in making up his payroll he needs to pay attention only to the red figures as all other are normal. The International Dial Recorders are the only machines in the world giving automatic service on these three vital features.

Our representative will be pleased to call upon your request and explain the best method of installing a time-keeping system suitable for your plant.

Bell Telephone Company's Application

THE Bell Telephone Company's application was considered before the Board of Railway Commissioners at Hamilton, November 4th; Toronto, November 5th; and Montreal, November 10th. At the Hamilton hearing certain evidence was put in on behalf of the Chamber of Commerce, etc. At Toronto, evidence was submitted by various organizations, some contending that no advance should be made, others appealing against the establishment of the measured service. In Montreal the stand taken was that the measured service should not be established, but that any increase found necessary by the Board should be secured through a flat increase on the present rates. It is expected that the final hearing at which various counsel will cross-examine the witnesses and submit argument, will take place at an early date at Ottawa.

Manifesting Shipments from United States

THE railroads in Canada have issued tariffs which became effective on November 1st, 1920, establishing a fee to cover the necessary work performed by their agents at border points in connection with manifesting shipments from United States to Canada. This charge is 11c. per shipment, and is to be shown separately on the bill tendered to the consignee.

A number of complaints have been received from interested members in connection with this new charge. The Transportation Department is making an investigation in regard thereto, and will have something to report in the near future. In the meantime, interested members are requested to make a study of their shipments for a period of say four months, two months during a period when shipments are heavy, and two months during a period when shipments are light, for the purpose of determining how much this charge will represent on a year's business, based upon the study for four months, the result of this study to be sent to the Transportation Department. In this connection members are referred to Circular No. 280, which was sent out a few days ago, calling for this information.

Reduction in Freight Rates Effective January 1st

FROM communications received in the Transportation Department, it would appear that some of our members are not clear as to what reductions are to be made on the first of January in the freight rates. The judgment of the Board of Railway Commissioners stated that effective January 1st, 1921, the increase in freight rates of 40 per cent. east of Fort William, and 35 per cent. west thereof should be reduced to 35 per cent. east of Fort William and 30 per cent. west thereof. In other words, the rates on the first of January, 1921, in Eastern Canada will be 35 per cent. higher than they were prior to September 13th, 1920, and the rates in Western Canada on the first of January, 1921, will be 30 per cent. higher than the rates in effect prior to September 13th, 1920.

The rates applied on business moving from the East to the West and West to the East are now 40 per cent. on the eastern portion and 35 per cent. on the western portion higher than in effect prior to September 13th, 1920. Effective January 1st, 1921, they will be 35 per cent. higher on the eastern portion and 30 per cent. higher on the western portion than those in effect prior to September 13th, 1920. For example, the first to tenth class rates "all rail" effective on January 1st, 1921, from Toronto to Winnipeg, Calgary and Vancouver, or in the opposite direction, will be as follows:

Between Toronto and Winnipeg.

1st	2nd	3rd.	4th.	5th.	6th.	7th	10th.
$2.89	$2.39½	$1.93	$1.50	$1.23½	$1.09½	$0.87	$0.79 per 100 lbs.

Between Toronto and Calgary.

$4.97	$4.13½	$3.33	$2.54	$2.16	$1.96	$1.45½	$1.28 per 100 lbs.

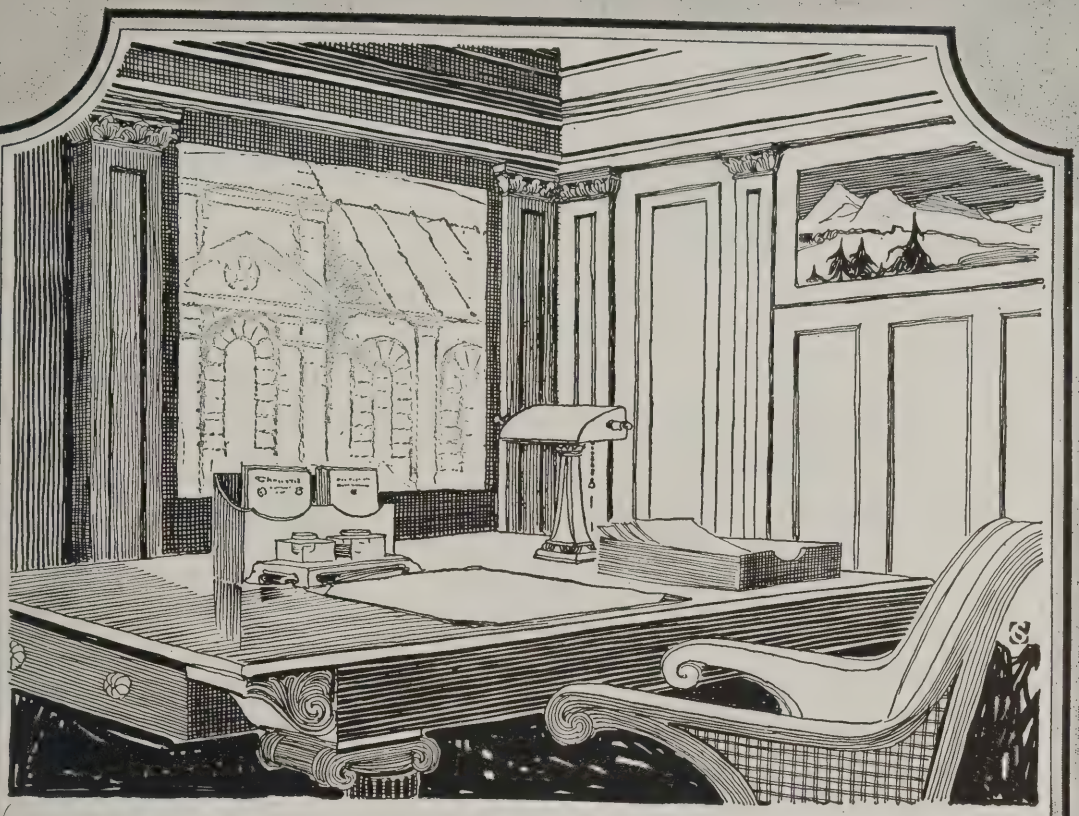
Between Toronto and Vancouver.

$6.17	$5.03	$3.94½	$3.14	$2.68	$2.44½	$1.88	$1.67 per 100 lbs

The majority of shipments from Eastern Canada to Pacific Coast terminals move under special commodity rates named in G. C. Ransom's Tariff 1-A, and shipments from Pacific Coast terminals to Eastern Canada move under special commodity rates named in W. E. Campbell's Tariff 101-B. The rates in these tariffs were advanced 33 1/3 per cent., or the same increase as allowed between points in Eastern United States and points on the American Pacific Coast, but no reduction will be made in these rates on January 1st, 1921.

Private Siding and Team Track Defined

A VERY interesting and important judgment was issued at Ottawa on October 21st, 1920, by Commissioner Boyce, concurred in by Commissioner J. G. Rutherford and Assistant Chief Commissioner S. J. McLean, covering the question of the status of a private siding and team track.



The judgment disposed of the complaint of the R. Laidlaw Lumber Company, Limited, Toronto, against the Canadian Pacific Railway, which was heard before the Board on September 3rd, 1920. Complainants stated that the Toronto Power Company's siding, owned and constructed by that Company, from which complainants took delivery of their lumber, was being considered by the Canadian Pacific Railway Company as a team track, and charges assessed accordingly. It was contended on behalf of complainants that the siding was a private siding and the Interswitching Order of the Board clearly defined a private siding as leased or owned by the consignee or shipper, and a team track as that owned or maintained by the railway company, the latter type of siding being charged 2c. per 100 lbs. as against 1c. per 100 lbs. for the former, the extra cent being established because of the fact that the railway company had the extra expense of securing and maintaining the siding.

The railway company contended that the Toronto Power Company's siding was a team track because of the fact that various firms used it in the unloading of their traffic, paying the Power Company a certain sum per car for the use thereof, and that therefore 2c. per 100 lbs. should be charged against all such shipments, shipments to the Toronto Power Company remaining at the rate of 1c. per 100 lbs. Commissioner Boyce very clearly points out that the question of "who shall use the siding," is a matter of contract and refers to section 9 of the Standard Siding Agreement used by the Canadian Pacific Railway, which states:

"The rights and privileges of the party of the second part under this agreement shall not be transferred or sub-let, either in whole or in part, except with the written consent of the Railway Company, provided that the Railway Company shall not withhold its consent to such transfer without good and sufficient reason, and the party of the second part shall have the right, should the Railway Company withhold its consent to such transfer, to appeal to the Board."

In other words, the owner of a private siding, who has signed an agreement with the railway company, must secure the consent of the railway company before it can allow other shippers or receivers to use its siding. It might be pointed out that the railway company cannot withhold such consent without giving good and sufficient reason.

The issue in this particular case, however, was slightly different, in view of the fact that the private siding was completely owned and maintained by the Toronto Power Company, and no agreement had been signed with the railway company. The judgment orders the railway company to refund any amounts collected over and above the regular private siding charge.

SUPERFINE LINEN RECORD

Your letterhead may pass through the mails, be handled by a dozen clerks, be filed, and refiled, and yet at the crucial moment, carry into a President's Office the suggestion of your Company's dignity and standing—if it be of Superfine Linen Record.

Harold C. Shipman & Co., Patent Att'ys
34 Central Chambers, Ottawa, Canada

Gentlemen:

The selection of a patent attorney whose ability, integrity and honesty can be absolutely depended upon is a matter of the greatest importance to inventors, some of whom are often deprived of the fruit of years of hard and persistent study and labor, due to carelessness on the part of attorneys to whom they entrusted their inventions with a view of obtaining a patent.

Your firm was highly recommended to me about two years ago when I intended patenting an Electric Reduction Furnace and, in consequence, entrusted you with the task of obtaining as broad a patent for me as possible and I am exceeding pleased to state that my confidence in your ability and integrity was not misplaced. All transactions with your concern have always been a source of pleasure to me.

This day I received my latest Canadian Patent No. 190,320 on Motor-driven Cable-supported Carrier, and wish to congratulate you upon your speedy securing of this valuable patent, and as it is my intention to sell both patents to manufacturers in Canada I shall give you first consideration for negotiating the deal.

Assuring you of my high esteem and appreciation, I am

Very sincerely yours,

(Sgd.) *G. L. Tanzer,*

GLT:MB

President.

Inventors from all over the World send their Canadian applications to Shipman & Co. at Ottawa. Prompt, personal service brings results.

Some of the Preventable Causes of Fatigue

(*Continued from page* 81.)

himself the next victim, and the general feeling of precariousness and anxiety are all emotions which weaken nervous vitality. Further, even where all possible precautions are taken it must be recognized that, on the psychological side, the existence of the need for precautions, on the physical side, the actual detail in connection with the taking of the precautions (as for instance the putting on of masks and goggles, or the adjusting of hoods), cannot be altogether ignored as possible contributing causes of fatigue. Although inevitable and not to be classed among the unnecessary causes they should be taken into account in connection with all questions of hours of work, rest periods, etc.

IV. *GENERAL HEALTH MAINTENANCE.*—(*a*) *Food.* The influence of good food as a preventive of fatigue, is theoretically realized by all, and during recent years the number of industrial establishments providing some kind of restaurant service has greatly increased. An official report on industrial welfare work in U.S.A., dated 1919, states that of the 431 establishments visited, 223 provide restaurants, cafeterias or other lunch facilities. "*Only two of the companies visited reported that they had tried lunch rooms and given them up.*" Similarly, an English committee of experts reporting in 1915 on the growth of industrial canteens states that the "practice has abundantly justified itself from a business and commercial point of view."

(*b*) *Sanitary Facilities*, etc. An obvious necessity for the physical comfort and well-being of workers is the provision of sufficient and convenient sanitary and washing facilities, and adequate supplies of drinking water.

(*c*) *Transportation.* The additional tax on workers who have to spend a considerable time in getting to and from work need not be emphasized. In some instances firms have found it in their interests to avoid this tax by putting up houses for their employees near the works. It is, of course, however, relatively seldom that this can be done, and most firms drawing their labor from a distance must, in estimating the capacity of their force, face this daily additional drain on its strength and endurance.

(*d*) *Suitable Clothing.* For some processes where the workers are exposed to great heat or where there are special health or accident hazards, it has been found essential to provide special working clothes.

V. *PSYCHOLOGY.*—The main cause of fatigue to be guarded against under this heading, is of course, the fundamental one of (*a*) *mal-adaptation of a worker to his job.* It has been admitted that monotony in industry can at the best only be alleviated, but nothing could more intensify the inevitable monotony of repetition work than that a worker's job should be one for which he has an inherent inaptitude.

Apart from this, fatigue is an unavoidable accompaniment of (*b*) *inexperience* and will be felt by every worker during the period when he is learning a new job and is confused by new surroundings and new demands upon him. More preventable causes are those connected with (*c*) *personnel.* An unjust and harsh foreman, the presence of one "anti-social" companion (whether a mental deficient, a neurasthenic or merely a "groucher" or maker of trouble) will react on all in the immediate neighborhood. Similar causes of fatigue are present where (*d*) *erratic management* permits lack of system, as for instance the issue of contradictory orders, irregularity in the flow of supplies and the like. Inefficiency in his immediate superior causes natural irritation to the efficient subordinate and prevents the growth of the sense of co-operation by which each individual can feel himself a necessary part in a well-ordered whole. It is useless merely to preach *esprit de corps* as a remedy for friction between employer and employee while the actual details of co-operation remain unsystematized.

VI. *WAGES.*—Finally, there is the question of a living wage. No sane employer who knows his own nature and judges his employees accordingly will expect whole-hearted and full strength service from harassed, underfed, badly-housed, insufficiently clothed men or women. In some cases the point at issue may be the actual wages paid; in the majority of cases in this country at any rate it is the subtler one of education in the spending of the wage. Both call for consideration and *in his own interests* the second is as much the employer's concern as the first.

[Enquiries on any of the points mentioned in this article should be addressed to the Secretary, Committee on Industrial Fatigue, c/o Medical Building, University of Toronto.]

Proceedings before Tariff Commission

(*Continued from page* 76.)

Breeders' Association, which was formed to encourage the breeding of pure bred stock. He stated that farmers, under conditions laid down, did not make enough money to pay income tax. With regard to implements, he said that he dealt largely with the Massey-Harris Co., who were competitors in the world's market, and he thought that farm mach inery was sold as cheaply in Canada a it was anywhere.

J. F. Riley, representing the Unite Farmers of Westmoreland, was to hav been present, but did not put in an ap pearance.

Hon. Senator McSweeney made a stat ment with regard to the textile industr and went over certain features of th history of the Dominion Textile Co. H thought twenty per cent. protection woul be ample.

The Company Paper

(*Continued from page* 85.)

the writers were quite convinced of the value. The exception was the Halifa Shipyards, whose experience was unfo tunate.

In August, 1919, the Halifax Shipyar began publishing a monthly paper, t *Shipyard Times*, for circulation free cost among their employees. The pap was very attractive in appearance, we illustrated, and printed on coated pap Publication was continued until the la issue in May, 1920. The June issue w in the printer's hands while negotiatio were under way between the mana ment and the representatives of t unions for a new agreement coveri conditions of employment. The old agr ment expired on May 31st and the m refusing to accept a general increase five cents an hour that was offered the went on strike. The publication of t *Shipyard Times* was, accordingly, in finitely suspended.

In industrial plants of the Uni States, the company paper seems to h found favor, judging by the amount f space devoted to it in business magazi Hardly a month passes without n article on some phase of the comp paper's work. In England, the Indust Welfare Society has been encourag them. In its second annual report e following passage occurs: "Another di tion in which the Society has been e to render valuable service to a num of firms has been in connection with e publication of works' magazines. e growth of this activity during the st few years has been remarkable, an a very large number of firms now pos ss their own house organ."

The experiences of other firms are ot always safe guides, but, in the case of he company paper, they seem to indi te that it is worth a trial. Run by a p able editor, it should promote the pr er feeling between management and m ployee, interest without interferenc on the part of the former, loyalty and ffi ciency on the part of the latter. It sh ld decrease labor turnover by showing w rk men that they are being fairly tre ed. Finally, it should promote the ide of safety first, and wage increasing wa re against the arch-enemy—carelessnes I these objects are attained the paper has repaid any time, trouble or expense on nected with it.

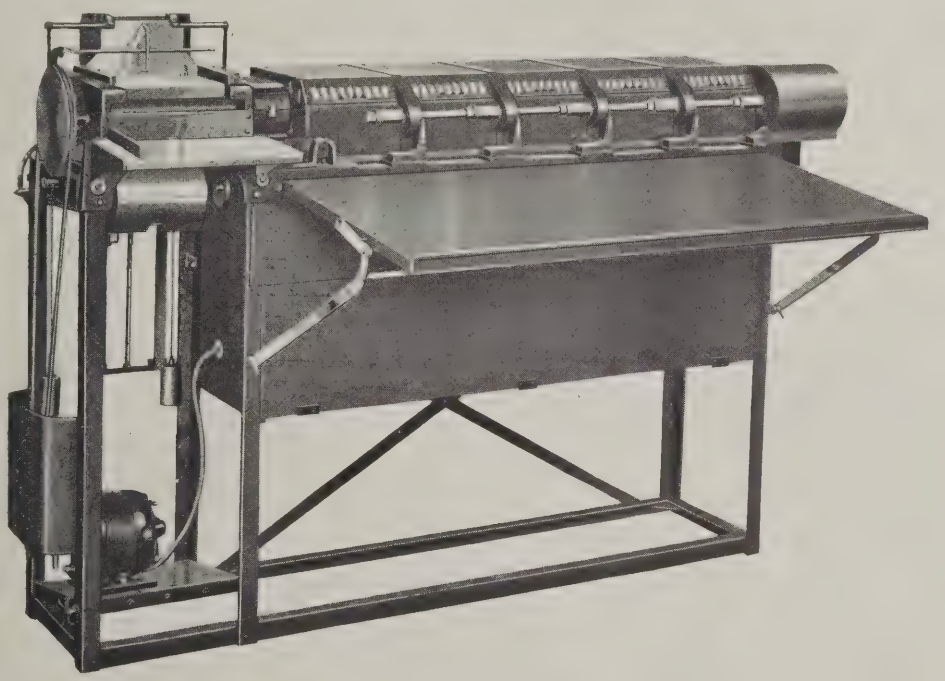
OFFICE AND FINANCE



Keeping Track of Time and Cost Records

By J. N. MILNER
Cost Department, International Business Machines Co., Limited

THE study of cost accounting will always be an interesting subject, and in some cases a problematical one, but there is a solution for most problems, and costing in all its branches can be simplified through the proper application of suitable mechanical devices. These devices are developed to the requirements of one or more departmental uses; therefore, it is quite apparent that care must be exercised in the choice of each mechanical unit, having always in mind the saving that can be effected through proper co-ordination. This particularly applies to the compiling of labor, cost, and stock records, for they comprise the heart of any manufacturing business, and should be subjected to a most careful analysis.

A brief outline of a system that is proven to be applicable to most manufacturing concerns in this regard can only be attempted here. Labor is purchased time; therefore, it should be weighed or checked carefully. The time clock, well suited to this purpose, prints the time of each employee in numerical order on a sheet with capacity for six registrations, thus, morning in, noon out, noon in, and evening out, overtime in and overtime out. The record sheet is removed from the clock every day, and checked. Due to the two-color ribbon, which prints all late or irregular items in red ink, the time required for checking purposes is negligible as only red items need attention. This record sheet, then, represents the bought time, and as time is only purchased to be sold at a profit, it is of much greater importance that job time be accurately checked.

The grocer with a daily turnover of $1000 would not think of weighing out his goods on an even balance scale which requires human judgment, and varies in the amount of commodity needed to balance with different operators. He uses an automatic computing scale, which shows the money value of the slightest fractions, for he knows that overweights eliminate his profits. Yet many manufacturing concerns are still depending upon pencil records of job time for arriving at their selling price. Good mechanics are usually poor clerks, and are prone to estimate time spent on jobs. Also shapes of pencil-written figures offer innumerable chances for wrong interpretation in the cost department. Pencil records can also be changed, and for this reason alone should be dispensed with, as a foreman is only human, and it is so easy to force a balance in favor of production labor hours in his department.

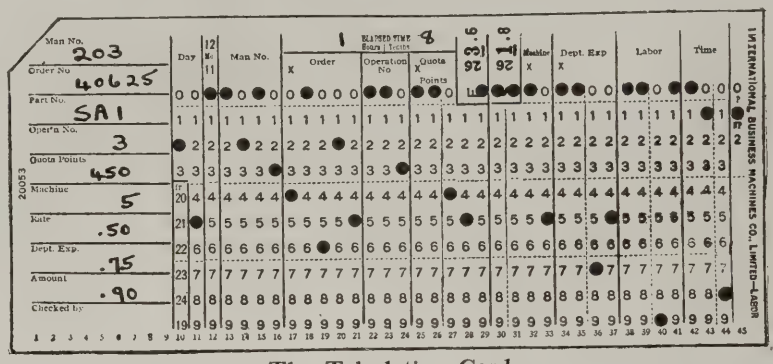
The Hollerith Tabulator

Used to tabulate the information supplied by the job time recorder

Many executives hesitate in making a change to job time clocks because their impression is that such a change requires special job cards, cost sheets, etc., and some because of the initial cost. The acquiring of actual knowledge and data pertaining to job time clocks and their advantages would soon dispel this view. Job time, stock, and payroll records are only so valuable as the use and analysis they are subjected to. Anyone who has seen how these records are made to divulge all their secrets by the use of a tabulating machine, will realize this. This wonderful mechanical cost accountant can be applied to all branches of record keeping, and offers an analysis that is impossible to attain through any other known agency.

The following method is used by us in keeping track of our time and cost records, and can very easily be adapted for use in any factory. At the end of the pay period information necessary for making up the payroll can be obtained in a remarkably short space of time.

First, a brief explanation of the mechanical devices used in connection with our system must be given, so that the reader may understand the various terms used in the ensuing paragraphs.



The Hollerith Tabular key-punch, automatic sorter, and combination job and time cards are the basis of our recording system. The machines sort and tabulate the information which the job time recorder supplies. In the first place the job time card can be arranged to carry any desired information. The specimen card shown in the illustration is used by us for our pay-roll and cost purposes. The card is punched in accordance with the information contained in the space at the extreme left. The automatic sorter then sorts mechanically the cards into any desired arrangement, and these in time when put through the Hollerith tabulator, will show as many as five different totals in one operation, as the machine has five counters working simultaneously. Both machines are electrically operated. The tabulator passes the cards through the sorter at the rate of 150 a minute. To explain more fully how the Hollerith tabulator and sorter work, the cards are punched by means of a key-punch, the numbers being used as a code for the different information required. The cards are sorted and tabulated by means of the punched holes in the cards.

We will now go through the details of an ordinary day's work.

The employee punches "In" and "Out" on the Dial Recorder. If late his time is registered in red print. This makes it very simple for the pay office at the end of the period to pick out the "lates," as all they have to check is the red figures.

At the commencement of a job the tabulating card is made out by the employee as to man number, part number, operation number, rate of pay, and the number of the production order on which he is engaged. In the cases of non-productive work the number of the expense account to which the time is to be charged is given in place of the production order number. The card is then punched on a job time recorder with the time of starting, and when the job is finished the card is again punched. This gives you a printed record on all jobs which cannot be changed, thus eliminating the chance for a big leak in your plant. This means that no time can be lost between jobs, as every minute of the day has to be accounted for on the cards. To eliminate the non-productive time a statement of non-productive hours against the productive hours is posed on a blackboard in the factory. This causes a friendly rivalry between the foremen in keeping down as low as possible the non-productive hours of their respective department.

The following morning all cards are turned into the cost office where the elapsed time and amount of pay earned is figured, together with the department expense or burden. The cards are then punched by a key-punch operator on the Hollerith key-punch. All the information contained in the left columns can be punched out on the body of the card.

The Tabulating Card

When the pay-period ends the cards are sorted in the automatic sorter. The cards for each man are separated and are put through the tabulator, which records the man number, hours worked during the week (which are checked by means of the dial clock slip, giving you a double check on your pay-roll) and amount of wages due. This is then transferred on to the regular pay-roll, completing the work in so far as time records are concerned.

But now the cards are utilized for cost purposes. They are sorted down so that the production order numbers run serially. Of course there may be many cards for one number, as the job may cover a period of a month or more, and also more than one man may be employed on the same job.

The cards are again put through the tabulator, and the production order number, hours spent on the order, amount paid in wages, and department expense, can be all obtained in one reading. These figures are taken down on a report, the amount of wages paid for the week balancing with the pay-roll. The time, wages, and expense are then posted right on to their respective production orders, copies of which are held in the cost department. From this it will be seen that when the production order is closed it is very simple to get

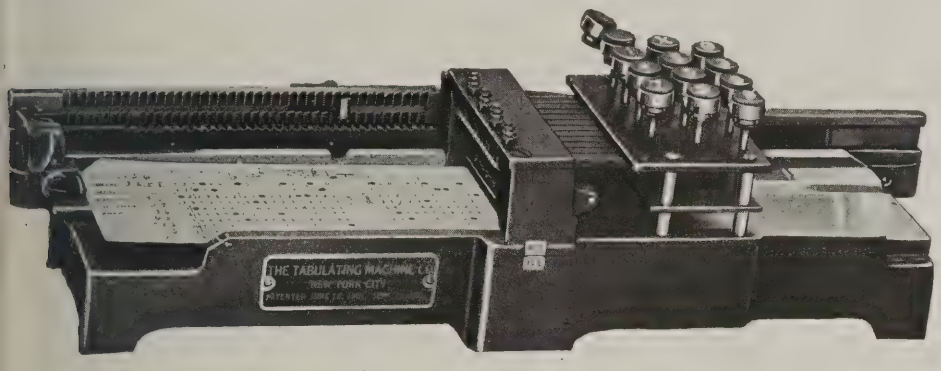
HEAD OFFICE - TORONTO



an accurate cost by merely adding the value of the material used to the figures already obtained. This is taken from the stores requisition, which carries the production order number, and is turned into the cost department after being filled.

From the weekly report a monthly analysis of the pay-roll may be prepared. All work done on production orders is of course shown as productive time, and non-productive time is shown according to the various expense accounts to which it is charged. By this means a close check can be kept on overhead expense, which, of course, is one of the chief factors in determining whether a profit or loss is to be made.

By the foregoing system accurate time and cost records may be kept without the mass of detail which the ordinary business man usually connects with the cost keeping.

Still the utility of the cards is not all consumed. At the present time we are installing a quota system in the factory, a certain time being allotted for each job, and any improvement on this time being suitably rewarded. The main point was to set a fair time for each operator. By means of our cards which have the printed record of the times of all operations performed for a year back punched on them, we are able to get actual and exact figures again with the aid of the sorter and tabulator.

We work on the old axiom that "figures cannot lie." Our dial recorders show the time of entering and leaving the factory, our job time recorders show the time wasted, if any, and the tabulating cards carry an indelible record of times made on any and all operations. Thus we have no disputes, and everyone is satisfied that he is getting a square deal, which is a great asset to a manufacturer in the day of high-priced labor.

The Key Punch

Used to prepare cards for the Tabulator and Sorter

Establishing Order

Writer in "Factory" Outlines Plan for Systematising Work

You've probably seen the man with his desk so littered up with paper that he has to hunt hastily through the whole pile each and every time he wants to find some certain paper. A great deal of time is wasted in the factory office by just this type of worker. He never knows just where his work stands and he is always busy and is generally considerably behind in his work.

The manager of one office realized the temptation for his lack of method and directness in his office work, so he devised a means of removing this temptation. The cornerstone of his plan was that a tidy desk makes a tidy brain.

On the desk of each clerk he placed a desk tray with three spaces. One

SENDING MONEY ABROAD

399 Branches in Canada Extending from the Atlantic to the Pacific

CANADIAN BUYERS OF BRITISH PRODUCTS—

AN enormous range of goods, in fact, practically every product manufactured in Great Britain, will be displayed at the Seventh British Industries Fair, organized by the British Government, for the inspection of the visiting buyer.

To make such an inspection, except at the Fair, would be the labour of months. The buyer would have to travel to every corner of the country, and even then he might miss the exact article he wants. He would have to make comparisons of similar products from memory, and might mistakenly select an inferior article.

The British Industries Fair affords the simplest, easiest, quickest, cheapest, and most efficient means of buying British products.

The buyer has the various manufacturers' products exhibited within a few paces of each other, this enabling him to make fair comparisons and quick decisions. Writing rooms, special Post and Telegraph offices, and restaurants are installed on the grounds for the convenience of the buyer.

A fully staffed office of the Department of Overseas Trade, of the British Government, is at the buyer's service. Here he may obtain all information regarding products—tariffs, shipping, exchange, etc.

The three sections of the Fair—London, Birmingham and Glasgow—exhibit an entirely different range of products, no industry being permitted to exhibit in more than one section. The London and Birmingham sections run concurrently, while the Glasgow section opens a week later—February 28th. An excellent railway service connects the three cities. Birmingham is a 2½ hours', and Glasgow a 10 hours' trip from London.

Full information, and invitations to bona-fide buyers, may be had, on request, from the nearest British Trade Commissioner, who will also recommend responsible brokers, if you cannot attend and have no representative in England.

CAPT. E. J. EDWARDS, H.M. Senior Trade Commissioner, 248 St. James Street, Montreal Que.
F. W. FIELD, H.M. Trade Commissioner, 257-260 Confederation Life Building, Toronto, Ont.
L. B. BEALE, H.M. Trade Commissioner, 610 Electric Railway Chambers, Winnipeg, Man.

THE BRITISH INDUSTRIES FAIR

February 21st to March 4th, 1921

LONDON — BIRMINGHAM — GLASGOW

space was labeled "To-day," another "To-morrow" and the third was marked "This week." A file was put in the drawer of each man. The file contained folders for every day in the month.

He then went around and had a talk with each man. He asked them to use the trays and files as he intended them to be used. He issued written instructions which outlined his plan. These instructions were as follows:

"File in each tray the work which should be done on the day designated.

"Have only one paper on the desk in front of you. All others are to be either in the file in the drawer or in the proper partition of the tray.

"Work on that one paper until everything possible is finished about it, then pick out the next job to work on. Work on that alone till it is finished.

"If you are interrupted while working on one paper don't go away and leave it on your desk. Put it in the tray marked "To-day" and pick it out again when you come back.

"Always finish up the work in to-day's tray before starting on to-morrow's.

"Every morning move the work in "To-morrow" up to "To-day" and take the day's work out of the monthly file.

"If it is necessary to get additional information on some work before you can go on with it, don't jump up and go after it immediately. Nor don't lay it on one corner of the desk to become mixed with something else you may have laid there before. Put it aside in the top right-hand drawer of your desk and wait until you have several things you have to look up—then do them all at once.

"Never have papers lying ahound promiscuously on your desk. Have one thing in front of you while you are at your desk, and nothing on the desk while you are away from it. And do one thing at a time and that well."

While this manager laid down some pretty stringent rules and instructions, he is working in the right direction and compliance with these rules cannot but benefit the worker and the office. He says that the improvement in the quality and quantity of the work accomplished, is quite noticeable.

M. I. N.

Banker Urges Caution

Manager of Molsons Bank in Vancouver gives Interesting Address on Finance

"Do not be pessimistic, but do be careful. Financially Canada is healthy. We have vast natural resources and are producing what the world requires to-day, and I am convinced our population will grow much during the next few years."

These were the concluding words of an address on "Finance," delivered before the Wholesale Bureau of the Vancouver Board of Trade last month by G. W. Swaisland, manager of the local branch of the Molsons Bank. Dealing with the part played by the banks in modern business, he said:—

"The banks are performing a great task in the world to-day, just as necessary and as important as that of any other business or profession. Our first duty is to our depositors and it is also our duty to endeavor to keep the wheels of commerce running smoothly, and to assist the legimate development of the productive resources of our country.

"The banking systems of all countries are now being put to the test, and I think you will agree with me when I say that the Canadian banking system is not surpassed by that of any other country. A short time ago banks were using all available funds to help finance this year's crop on the prairies, and now this money is beginning to come back. It will be available for use elsewhere."

The speaker dwelt at some length on the necessity of caution, making it clearly understood that there was no reason for pessimism. "Banks are sometimes criticized when they find it necessary to curtail loans," he said.

"It is improbable that at any previous time in the history of the Dominion the credit structure of the country has

been put to a more severe test than during the present autumn. Demands from commercial and industrial borrowers have been insistent and heavy, a fact which is reflected in the showing in the bank statement in respect to current loans which grew in September by over $32,000,000 to the record total of $1,417,000,000.

"The increase during the past year, ending September 30, in Canadian banks, was as follows," said the speaker. "Loans, $360,000,000, while the bank deposits only showed an increase of $70,000,000. Banks are just as anxious to lend money as you are to sell goods—but there is a limit.

"The great expansion in banking business during the past few years has not been accompanied by a corresponding increase in the paid up capital, or in the capital funds," he continued. "In August, 1914, the paid up capital and surplus of Canadian banks was an amount equal to about 20 per cent. of the total amount of the deposits. To-day this percentage is reduced to about 10 per cent."

The speaker said it was the opinion of many that bank loans would now begin to show reductions, and owing to the general drop in the cost of all commodities loans to merchants will probably show considerable reduction.

Adjourned Meeting Held.

Consolidated Report of Lake of the Woods Milling Company, Limited, and Subsidiaries Presented

The adjourned annual meeting of the shareholders of the Lake of the Woods Milling Company, Limited, was held in Montreal on November 3rd, and the executive and board of directors were re-elected without change for the ensuing year. A combined balance sheet of the Lake of the Woods company and subsidiaries was submitted to the shareholders, the figures shown being as at September 1st last, and showing the increased capitalization, which on that date stood at $3,500,000 common stock issued, and $1,500,000 preferred, bringing the total up to an even $5,000,000.

The statement includes the assets and liabilities of the Keewatin Flour Mills Company, the Sunset Manufacturing Company, and the Medicine Hat Milling Company, in addition to the parent concern, the combined property assets of which are shown at $4,354,226, compared with $3,080,588 disclosed in the exhibit of the Lake of the Woods company at the end of August. Elsewhere the statement of the combined companies contains a number of interesting changes. Inventories of wheat, flour and mill supplies are given at $1,498,306, or $15,739 in excess of the Lake of the Woods figures alone, as at August 31. From these inventories has been taken an amount for reserve, an altogether new item, "reserve account," appearing among the liabilities at $900,000. This new reserve is in addition to the contingent one of $697,519 contained in the Lake of the Woods proper statement at the end of the last fiscal year.

The working capital figures revealed in the consolidated showing disclose the usual strong position, current assets exceeding liabilities of a like category by $3,844,067, compared with $3,481,089 in the Lake of the Woods statement as at August 31st last.

Profits Are Lower

Annual Statement of Western Canada Flour Mills Company, Limited, Submitted to Shareholders.

The annual statement of the Western Canada Flour Mills Company, Limited, submitted to the shareholders at a general meeting held in Toronto on October 29th, shows a slight decrease in profits as compared with the previous twelve months. This decrease was largely due to the lack of export business, which necessitated the closing of the mills for various intervals, with the result that production was substantially reduced. With the abolition of the Canadian Wheat Board, the president, Andrew Kelly, points out, there is now permitted the resumption of business with foreign connections as

MANAGEMENT

In A Declining Market

it is important for the manufacturer or merchant to hold down to a minimum the quantity of materials in storeroom and goods in warehouse, and to turn inventories as quickly as possible into cash.

Success in the accomplishment of these results depends upon the effectiveness of control over stocks of material and merchandise, work-in-process, and goods in branch houses.

Are you sure your methods of control are adequate to enable you to make a satisfactory profit for the coming year?

We are especially fitted through long experience to be of service in equipping your business with methods that will provide the essential control.

prevailed before the war. Provided the mills are operated to capacity, he states the current year's results should be satisfactory.

Net profits for the year ended August 31st last, amounted to $414,723, compared with $437,986 in 1919, and $543,844 in 1918, which was the banner year in the history of the milling enterprise. After deducting bond interest there remained available for application to the oustanding capital stock of the company a balance of $335,470, or equal to 13.5 per cent., against 14.4 per cent. in 1919, and 19.9 per cent. in the record 1918 year.

The company distributed among its shareholders during the twelve months covered by the report the sum of $250,000, representing dividends at the annual rate of 8 per cent, and a bonus of 2 per cent. In addition, early in the fiscal period, shareholders received a special bonus of $250,000 in Victory bonds, as was the case in 1919.

After all deductions were made there remained a balance to the credit of profit and loss account of $548,335, compared with $712,865 on August 31, 1919, and $858,434 at the close of the previous year.

The balance sheet portion of the statement reveals the comfortable financial position reported in former statements. Current assets of $2,243,371 exceed liabilities of a similar category, amounting to $1,194,093, by well over a million, or leaving the working capital of the company at approximately the same level as a year ago and comparing with $910,730 in 1918.

President Kelly, in his report to the shareholders, states that during the year the erection of an office building was commenced on Macpherson Avenue, Toronto, adjoining the warehouse. The building will be ready for occupancy at an early date and the head office of the company will be moved to the new premises.

Bonus is Announced

Five Per Cent. to be Paid on Common Shares of Woods Manufacturing Company, Limited

A bonus of 5 per cent. on the common shares of the Woods Manufacturing Company, Limited, was announced in Montreal on November 18th. The regular quarterly dividend of 2 per cent. was also declared, dividend and bonus being payable December 1st to shareholders of record November 25th. This makes a total distribution of 13 per cent. for the year.

Merchants Bank

Marked Expansion in Assistance Bank has given to Canadian Trade and Commerce

The close association established by the Merchants Bank of Canada with the expansion of the business and industry of the Dominion is strikingly shown by the semi-annual statement of the bank, to October 30th, 1920.

The Merchants Bank, with its complete organization throughout the Dominion, is known for the special assistance to growing and expanding businesses and the report now issued shows that it has been particularly active in this direction during the past year. This is reflected by the increase in current loans and discounts to customers to $120,515,402, as compared with $102,346,514, a gain of $18,168,889.

With a view of increasing its facilities to the farmers and merchants and the manufacturers of the country, the bank has provided for an increase in capital and as a result the paid-up capital now stands at $9,955,970, an increase to date of $1,614,434. At the same time the reserve has been increased by $1,400,000 and now stands at $8,400,000. Both these amounts will be further increased by the instalments still outstanding.

A further substantial gain in savings deposits indicates that the Canadian people are practising habits of thrift. During the year the savings deposits of the banks have been drawn on heavily to meet payments for the last Victory Loan campaign. Notwithstanding this development, the bank shows a gain in savings deposits of $4,628,040 and total deposits now stand at $170,634,061, up from $166,006,015.

As a result of the expansion, the total assets established a new high record by crossing the $200,000,000 mark. They now total $209,450,448, against $198,506,572.

Bank of Montreal

Favorable Statement for Past Year Lends Encouragement to Present Situation

The financial report of the Bank of Montreal for the year ending October 30th becomes available at a somewhat critical moment in the readjustment of financial and industrial conditions in Canada. The report reflects continued prosperity in Canada's premier institution and its publication will be found welcome and reassuring.

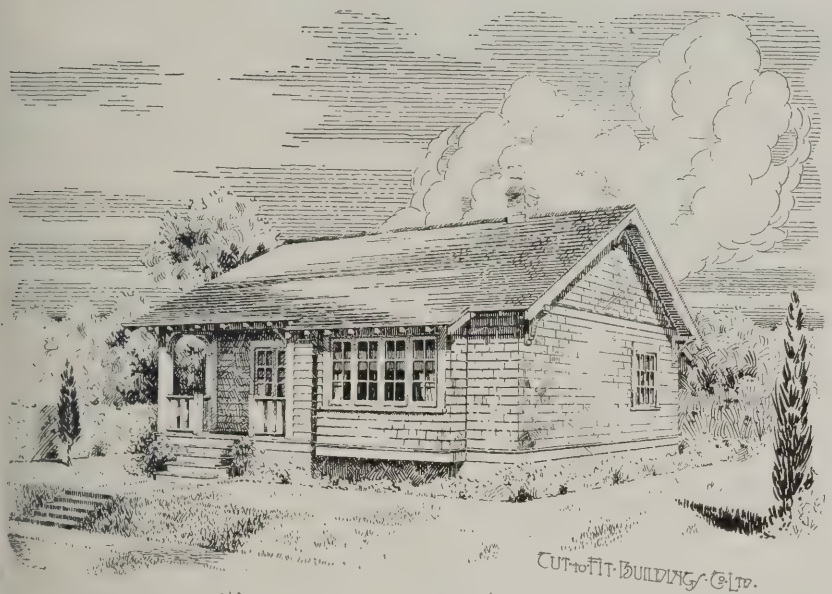
The statement indicates that the bank has been able to take care of an unusually large proportion of the increased requirements of the merchants and manufacturers of the country. The increase in the loan account during the year amounted to approximately $60,000,000.

At the same time there has been a striking reduction in the accounts which reflect the special business which the Bank of Montreal undertook during the war period on behalf of the Imperial and Dominion Governments. As a result, the holdings of Dominion and Provincial Government securities have been reduced to $14,863,954, compared with $63,984,255 at the end of the previous year. Canadian municipal securities and British, foreign and colonial public securities, other than Canadian, have also declined, the total this year being $36,749,430 against $47,041,359.

Owing to the marked expansion of the business of the country, the bank arranged during the year to increase its capital and this now stands at $22,000,000, a gain of $2,000,000 for the year. A corresponding increase was also made in the rest account, and this now stands at the same figure as the capital.

In addition, savings deposits continue to indicate a healthy gain and these now amount to $322,578,613, a gain of approximately $10,000,000 for the year.

As a result of these increases, the total assets of the bank stand at $560,150,812, up from $545,304,809 at the end of the previous year.



The larger amount of capital which the bank had at its disposal and the increase in the value of business handled has resulted in a steady expansion in the earnings of the bank. The net profits for the year amounted to $4,033,99 compared with $3,314,227 a year ago. These profits, added to the balance of profit and loss and to the premium obtained on the new stock issued during the year, made a total amount available for distribution of $6,846,850. This amount was appropriated as follows: Regular dividends and bonus, $4,960,000; amount credited to rest account, $2,000,000; war tax on bank note circulation, $210,000; reserve for bank premises, $425,000, a total of $5,595,000, and leaving an amount to be carried forward to profit and loss of $1,251,850.

Altogether the report is a most encouraging document appearing at a time when the shrinkage of inventories and financial stringency are casting their unfavorable spell over the sentiment of the country.

The Canadian Manufacturers' Sales Corporation have published a study by Percy Montgomery, entitled: "Co-operation in Industry." In it the objects of the Corporation, the services and methods of transaction are explained.

Please take notice that the undersigned attorneys for the patentee are prepared to supply at a reasonable price any demand for anti-creeping devices for railway tracks as described in Canadian Patent 186389, granted Sept. 3rd, 1918, to D. M. Patrick. They are also prepared to receive offers for the purchase of the patent or for licenses to operate under the same. Ridout & Maybee, Kent Bldg., Toronto, Canada.

Canada's Industrial Expansion

A Record of Progress

Now Making Conduits

Canadian Triangle Conduit Company, Limited, Are Manufacturing in Toronto

The Canadian Triangle Conduit Company, Limited, are among Toronto's newer industries. In their factory on Prescott Street, a building with some 10,000 square feet of floor space, they are now manufacturing flexible steel conduit, flexible conduit (loom), and armored cable. The employees are about thirty in number.

Officers of the new company are: V. C. Gilpin, president; E. E. McAuliffe, vice-president; J. Herbert Hall, secretary; and E. B. Watts, treasurer. Conduits Company, Limited, are their general sales agents.

New Battery Factory

Dominion Battery Company, Limited, Occupy New Plant on Trinity St., Toronto

Only the finishing touches remain to be added to the new building of the Dominion Battery Company, Limited, at the corner of Trinity and Mills Streets, Toronto. The plant, which was formerly a windowless tank-room of the Gooderham distilleries, has been transformed into a four-storey modern factory, fully equipped for the production of "Reliable" batteries.

The Dominion Battery Company were formed in the fall of 1917, and their new building is an indication of how their business has expanded. When the plant is running to capacity the number of batteries made will be three to five times the former output. Besides batteries for flashlights, the company also make ignition units for automobiles, trucks, and household uses.

Clarke Brothers, Limited

Extensions Being Made to Bear River Plant Will Almost Double Its Capacity

In a circular letter issued by Clarke Brothers, Limited, a report is given of the extensions being made to their plant at Bear River, Nova Scotia. In spite of unfavorable weather conditions last fall and winter, which caused an abandonment of the work for four months, the buildings are now nearing completion and the machinery is being rushed forward and set up as fast as it arrives.

The original mill had a capacity of thirty tons a day. The extension with the additional equipment purchased will increase this to fifty tons. The company also report that

New Plant of Dominion Battery Company, Limited, Trinity and Mills Streets, Toronto

they have been able to acquire rights to certain improvements in the manufacture of kraft pulp, and the quality of their product will be greatly raised as a result. Although these developments will almost double the capacity of the plant it has been found necessary to increase the indebtedness by only $250,000, making a total indebtedness of $1,250,000.

Are Rebuilding Plant

Mann Axe Company, Limited, Will Operate at St. Stephen About February 1st

The Mann Axe Company, Limited, successors to the Mann Axe & Tool Company, Limited, of St. Stephen, New Brunswick, are rebuilding their plant which was destroyed by fire on July 10th last. A one-storey, steel frame building is being constructed, 160 x 65 feet, which, when fully equipped will cost in the vicinity of $75,000. The foundation will be of concrete, and brick will be used for the remainder, the company's aim being to have a factory that is at once attractive, strong and fireproof. About fifty men will be employed in the manufacture of axes and edge tools. The beginning of February is the date set for the commencement of operations.

Fibre Box Factory

Clarke Brothers Paper Mills, Limited, Buy Plant at Glen Falls, N.B.

The organization of Clarke Brothers Paper Mills, Limited, brings the making of fibre and shipping cases under one control from raw material to finished product. The new company, an outgrowth of Clarke Brothers, Limited, of Bear River, Nova Scotia, have acquired the Ford Motor Company's plant in Glen Falls, near St. John, New Brunswick, and will carry on the manufacture of fibre and corrugated shipping cases there from kraft pulp supplied by the Bear River Mills.

The plant, though built for the purposes of automobile manufacture, has been found altogether suitable for the making of paper products. It consists of two buildings, equipped with sprinkler system and other modern devices, and has a total floor space of 36,000 square feet. The larger building measures 80 by 227 feet and the smaller 60 by 227 feet. Daniel McLarty, formerly superintendent of the J. R. Booth mills at Ottawa, has been appointed superintendent of the Clarke Brothers Paper Mills.

The authorized capitalization of the company is $5,000,000 in common stock, of which $3,000,000 is to be issued. An issue of $1,500,000 of 7 per cent. first mortgage sinking fund bonds is also authorized, of which $1,250,000 will be sold. The bonds are unconditionally guaranteed by Clarke Brothers, Limited. Manufacturing operations will probably commence in January.

Bathurst Power Development

Bathurst Lumber Company, Limited, Developing Water Power on Nepisiquit River

The power which runs the mills of the Bathurst Lumber Company, Limited, will soon be supplied from their own plant now under construction at the Grand Falls on the Nepisiquit River. They are building there a thirty-five foot dam which will give a head of 110 feet. Two units of 4,500 horse-power each are now being put in and provision has been made for installing a third unit of the same size at a later date. The style of equipment is the umbrella type of generator and it is manufactured by the Canadian General Electric Company at their Peterborough, Ontario, plant. The turbine wheels are manufactured by the Boving hydraulic and Engineering Company at Lindsay, Ontario, and are now being installed.

The plant is of the best known concrete and steel construction and a very handsome building. Most of the concrete work is now completed and the company are just commencing the installation of the machinery. They expect to have all machinery installed and the plant in operation by

JOHN HILLOCK & COMPANY LIMITED

Office and Factory - 154 George Street, Toronto

So They Called the Expert In

Fred Brock of Baxter and Company was a good Office Manager. That was an acknowledged fact, both among his business associates and the boys at the club. People discussed his organizing ability and the capable staff with which he had surrounded himself.

ONE thing troubled Fred, though: his filing system and certain details of office routine. In the rush of two years of unprecedented business he'd no time to re-organize his system. As a result it had become unwieldy; papers were becoming increasingly difficult to find; complaint reports were coming in with greater frequency from the "Chief" and other department executives, so Miss Thompson, the filing clerk reported.

That was just a year ago—before Fred Brock called to his aid the System Service Expert of "Office Specialty". His business day is much pleasanter for him now—since the "Office Specialty" System Expert analyzed his existing systems and submitted a plan that would not only remedy the immediate trouble, but make ample provision for natural expansion for some time to come.

This is the type of expert service that "Office Specialty" is rendering to its thousands of clients to-day— a concrete service backed by the resources of a centralized System Department whose cumulative experience in solving filing and record-keeping problems in many different kinds of business is offered to you in your individual problem without fee or charge, or without reservations of any kind.

SYSTEM SERVICE

"Office Specialty" System Service Experts are men who merit the name *expert*. They are trained, practical men. They will gladly make your office routine, record-keeping, or filing problems their own. Their value to themselves, and to us, depends upon the value of their service to you.

Put your office routine or record-keeping problem up to our nearest Service Store.

April 1st, 1921, and the power will then be transmitted about eighteen miles on steel poles and copper wire to the plant in Bathurst, New Brunswick, where most of it will be utilized.

In addition to this transmission line, the company are putting in quite an extensive pumping station in connection with their pulp-mill, and are building a concrete pump-house and a wood stave pipe line with 48-inch inside diameter to carry water from the Nepisiquit River into their pulp mill—a distance of about two and a half miles. In this pumping station they are installing three 17,500 gallons per minute centrifugal pumps.

As soon as these two operations are completed, the Bathurst Lumber Company expect to commence the work of doubling their pulp mill's capacity, and they will also install paper machines to manufacture a portion of their pulp into paper at Bathurst.

The hydraulic work in connection with the development is in charge of William Kennedy, Jr., hydraulic engineer, of Montreal, and the electrical part of the construction is under the supervision of Dr. L. A. Herdt, electrical engineer of McGill University. Messrs. Morrow & Beatty, of Peterborough, Ontario, are doing the construction at the Falls under contract, and W. J. George, of Ottawa, is directing the work on the pumping station and transmission line. The company report that the work is being carried on in a very efficient manner and is of the best possible permanent construction.

Alkali Plant Extends

Brunner, Mond, Canada, Limited, Will Soon Complete Addition to Soda Ash Plant

Brunner, Mond, Canada, Limited, alkali manufacturers, at Amherstburg, Ontario, have an extension to their soda ash plant well under way, which entails an expenditure of approximately $1,000,000. The original plant, a fireproof building of steel and concrete construction was completed last year and manufacturing operations were commenced on October 1st, 1919.

At that time a 50 per cent. output was sufficient to meet the demands of customers. It has been found necessary to increase the output sufficiently to guard against any shortage of a product essential to many other Canadian manufacturing industries. The extension should be completed and in operation early in December. As it will increase the production 50 per cent. above the original maximum capacity, the company expect to keep abreast of all Canadian demands for some years to come.

Remanufacturing Lumber.

Knox Brothers, Limited, Purchase Part of the Davis Shipbuilding Company's plant at Levis,

Knox Brothers, Limited, a lumber firm of Montreal, have purchased the wooden shipbuilding plant of the Davie Shipbuilding & Repairing Company, Limited, at St. Joseph de Levis, Quebec, and have fully equipped it with the necessary machinery for remanufacturing lumber.

The company were left with a very large quantity of B.C. fir timber on their hands due to the cancellation of a number of large contracts on the signing of the Armistice. They also had about ten million feet of Quebec spruce left over from their export contracts. As the only feasible plan of marketing this material to advantage involved further manufacturing, they decided to equip an up-to-date saw-mill and planing mill at Levis. They have installed there one 8-foot band saw for resawing their big fir timber, a number of 6" band saws and six planers.

In a letter to INDUSTRIAL CANADA, J. B. Knox, says: "We are able at the present time to take care of about eight cars per day, and we intend to increase our capacity until we can

remanufacture at least twenty cars per day. Our main mill is 500 feet long by 108 feet wide, and we have track storage room to accommodate about forty cars. We have another building which we intend to equip with machinery for making box shooks. Both of these buildings are well heated, so that we can work the year around to advantage. We have already started our operations and so far everything has been entirely satisfactory.

We are located at Levis, where we get the advantage of through rates from any point on the Canadian National Railways, including their Transcontinental lines. We also get the advantage of through rates from the Grand Trunk and the Quebec Central Railways. Shippers in Toronto or in any part of Canada who buy lumber east, north or south of Quebec City can have their lumber shipped to our plant at Levis and stopped off there for further manufacturing. Their shipment then can continue to its destination on the balance of the through rate. For this privilege they have to pay a minimum charge of $5.00 per car."

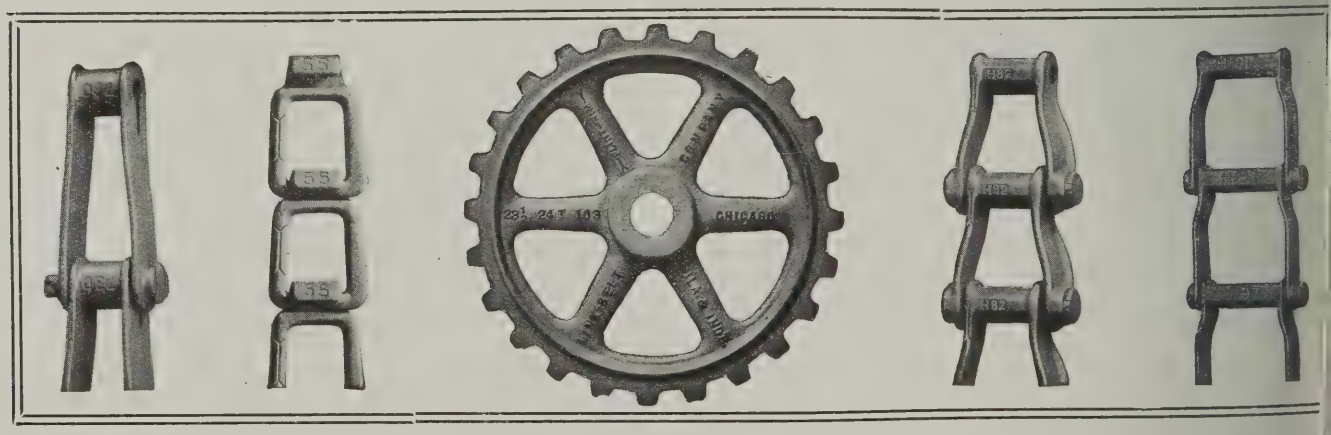
With the original cost of the plant and the money being spent on it by Knox Brothers for improvements and new machinery, the total valuation will be almost $500,000. The present owners believe that when they have the mill running to full capacity it will be the largest remanufacturing plant in Canada.

Waterproofing Materials

B. C. Impermealite Company, Limited, are a New Vancouver Industry

The B. C. Impermealite Company, Limited, are a company now manufacturing waterproofing liquids in Vancouver. Their plant is situated at 587 Seventh Avenue West, in that city and their offices are in the Rogers Building. The f tory covers a lot 33 x 120 feet and is equipped with the m ing tanks used for preparing the liquids.

Two men and an expert are employed in the factory, a with this force 20,000 gallons a week can be turned out. T output can be easily increased as the demand for the p duct grows. The liquids manufactured are trade-nam "Curo" and "Impermea" and are used for waterproofing c crete and hardening stone. The company have already fil a number of contracts satisfactorily.



To Manufacture Veneer.

Waterville Veneer & Panel Company, Limited, Ha Acquired a Plant at Waterville, Quebec.

At Waterville, Quebec, a new company, the Watervi Veneer & Panel Company, Limited, have acquired a fact formerly owned by George Gale & Sons. This plant ha floor space of 150,000 square feet and is being remodelled suit the requirements of the purchasers.

The company expect to be ready for operation about Ma 1st, 1921, with a force of 150 hands. They will manufact all Canadian hardwood single ply veneer, such as bi maple, basswood, beech, elm and ash. Among their produ will also be panels in three and five-ply of various thickne and grades, and panels faced with cabinet woods such mahogany, walnut, plain and quartered oak and all other fa woods. The plant will have a capacity of one carload of sin ply veneer and 20,000 feet of panels per day.

The directors of the Waterville Veneer & Panel Compa are all Montreal men. J. H. Sherrard is president; H. Lefe vice-president and general manager, and A. Conway, secreta

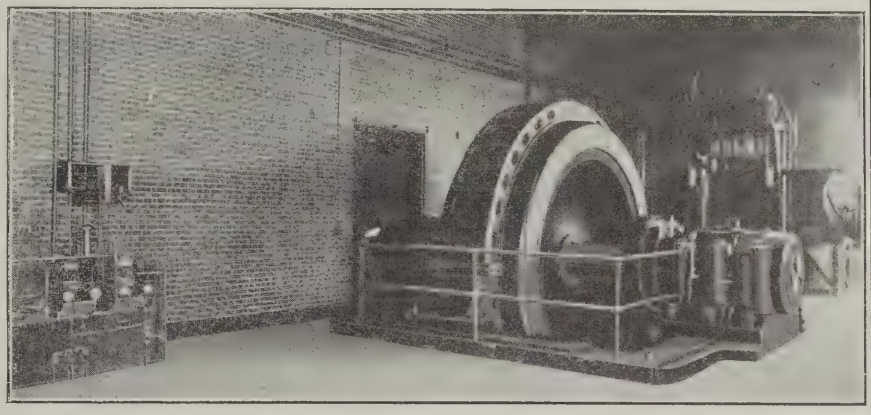
CONSERVATION OF OIL



THE consumption of mineral oil products is increasing faster than the production. Consequently Engineers and Industrial Executives are beginning to realize how important and necessary it is to conserve these oils.

A BOWSER OIL FILTRATION SYSTEM will assist you in doing this.

By filtering oil with a Bowser System it can be used over and over again—or indefinitely. The installation of a Bowser Complete OilFiltering and Circulating System generally results in a saving of over 50 per cent. on your oil bill.

The picture on the right shows a practical application of a Bowser 6-F Oil Filtering and Circulating System.

Write for our Booklet on Oil Filtration.

treasurer. R. Bradshaw and E. G. Donegani are also on the board. The company's authorized capital is $500,000, fully paid up, with a liability of outstanding bonds to the amount of $155,500.

Making Truck Bodies,

Carriage Factories, Limited, Use Orillia Plant for Truck and Pleasure Car Bodies.

Carriage Factories, Limited, of Orillia, Ontario, are going extensively into the manufacture of all kinds of bodies for motor trucks of different makes, in addition to the manufacture of bodies, open and closed, painted and trimmed complete for pleasure cars. They are devoting their Orillia plant to these lines entirely and have made considerable changes in their production equipment there. The company have the sole Canadian manufacturing and selling rights for the Rex sedan tops, which are suitable for a number of makes of cars.

The carriage and cutter productions have been removed to the company's plant in Alexandria, Ontario, and in Montreal they are carrying on the manufacture of harness exclusively instead of carriages, blankets, harness, etc., which were made there up to two years ago.

Cobourg Furniture Factory

Langslow, Limited, Will Commence Manufacturing Operations Early Next Year

A Canadian branch of the Langslow Fowler Company of Rochester, New York, has been established in Cobourg, Ontario, under the name of Langslow, Limited. The initial corporation is under Dominion charter, and on a basis of $500,000 authorized capital, with approximately $250,000 paid in at the time of beginning operations.

The company will begin production on February 1st, 1921, and their activities will include the manufacture of household, school and office furniture, and other wood and steel products. One hundred hands, both men and women, will b employed during the first year, and this number will be in creased as the expansion of business which the company ex pect takes place.

The plant to be operated comprises a main building wit 26,400 square feet of floor space, a power plant with an ult mate capacity of from 400 to 500 horse-power, and a new dr kiln fully equipped to handle 60,000 feet of lumber weekly.

The company will transact business throughout Canad and will undertake such export business as is found expedien The principal officers of Langslow, Limited, are: Stratton Langslow, president; H. R. Langslow, vice-president an managing director, and Paul Knox, secretary-treasurer.

To Make Phonographs

Canadian Edison Phonographs, Limited, Will Soon Commence Operations in St. Thomas

An important addition to the industrial establishments St. Thomas, Ontario, is Canadian Edison Phonographs, Lim ited, who are taking over the factory formerly occupied b St. Thomas Cabinets, Limited, and equipping it with th machinery necessary for the manufacture of phonograp cabinets and the assembly of phonographs. The buildin included in this plant have a total floor space of about 80,0 square feet.

The company will begin operations early in Decembe employing about sixty people. For the present they wi import from the parent factory at Orange, New Jersey, th phonograph mechanisms and other parts which cannot purchased or manufactured in Canada. Their present sch dule calls for an output of seventy machines a day, whic will be increased as the demand for the product in Cana and the British Empire warrants.

Canadian Edison Phonographs have an authorized capit of $500,000. The officers of the company are: T. A. Edis president; C. Edison, chairman of the board; S. B. Mambe

The Canadian Appraisal Company

Limited

The Pioneer Appraisal Organization of Canada

ESTABLISHED 1905

THE Canadian Appraisal Company, Limited, has now completed fifteen years of service and enjoys to-day an unrivalled position as an Appraisal organization amongst manufacturers as well as insurance and financial houses within the Dominion.

Approximately 4,500 properties have been appraised by us to date. Amongst these are the most representative industrial concerns and those which are "a household word" in practically every line of manufacture; including also all the properties comprising the recently formed "British Empire Steel Corporation, Limited."

We are therefore able to offer to clients the very best Appraisal Service that is to be obtained, yet one which it is our constant ambition to improve and perfect by every means in our power.

Some New Tools

The Brantford Machine & Tool Company, Limited, Bringing Out Several New Products

The Brantford Machine & Tool Company, Limited, have been incorporated to take over the former business of the Brantford Machine & Tool Company. While no extensions are contemplated for the present, the company are bringing out several new tools for the Canadian market. One of these is a bench slitting shear that will handle up to ¼" plate, and another is a garage press with a capacity of about ten tons. It is planned particularly for garage work but may also be used as an arbor press for machine shops. The company are also bringing out a portable boring bar for reboring Ford cylinders. These tools will be ready for market, it is expected, early in December.

Large Glass Industry

Canadian Libbey-Owens Sheet Glass Company, Limited, Will Build at Hamilton

The Canadian Libbey-Owens Sheet Glass Company, Limited, recently incorporated for $1,680,000, have decided to locate their plant in Hamilton, Ontario. Their decision was largely due to the efforts of C. W. Kirkpatrick, Commissioner of Industries and Publicity, who furnishes the following account of the new enterprise:

The Canadian Libbey-Owens Company are a concern organized under the Joint Stock Companies Act of the Dominion of Canada, to engage in the manufacture of flat glass by the process covered by the American Libbey-Owens patents. Previously to the war about 90 per cent. of th flat glass used for building purposes in Canada was su plied by Europe. Since the war it has been supplied chief from the United States. In recent years the manufacture glass has been converted from a hand to a machine indu try, and the Libbey-Owens process is the last word in ec nomy and efficiency of production. These machines are co tinuous and automatic, night and day, and produce glas from 1/16 ins. thick to 5/16 ins. thick, and by reason the flat drawing method the glass itself is absolutely fla perfectly annealed and of a better quality than is possibl by any other known process. The Canadian Company posses the exclusive right to the use of these machines in Canad Aside from the parent company, the Canadian plant is th second to be constructed. The first is in Japan, and com menced manufacturing in October last.

A site of ten acres, known as the Traiton L. Moore pr perty, has beeen secured in Hamilton. This is on Kenilwort Avenue, northeast of the Jockey Club, or between the G.T.R and old Northwestern tracks. It is south of the site chose by the Firestone company for the building of workmen homes.

Arrangements have been made already for constructio of the necessary buildings and every effort is being mad to rush the construction. Over one hundred men will b employed on the excavation and construction this winte but it is not expected that the plant will be completed fo another year.

In the physical conformation of the buildings and in th method of manufacture, the Libbey-Owens process is so di ferent from any other process hitherto known, as to constitut an entirely new industry. The Hamilton plant will be ca able of taking care of more than half the consumption Canada. The buildings will cover the larger part of te acres and will be architecturally attractive and a credit t the city. The main building, which will be of concrete, ste

Look for the **G** *on all cast iron fittings*

Tapping Cast Iron Tees on a machine in one of our Foundries.

Yes! They are Different!

You'll find that Grinnell Pipe Fittings ***are*** different—that in consistent quality they stand head and shoulders above any pipe fittings you have ever sold. And here's a sound, selfish reason for this consistent Grinnell quality—we are big users of our own fittings.

Some time ago we found that nothing but the best pipe fittings would do in our Grinnell Automatic Sprinkler Systems, heating and other piping work. The only sure way to have a thing right is to do it yourself. So we started making our own fittings. Quantity production soon gave us a surplus to offer in the general market. And so this great pipe fitting branch of our business started.

Today Grinnell Fittings are easy sellers and satisfaction givers. Every fitting is perfect—inspected twice for the slightest flaw. They couple easily and make tight joints. Any doubtful ones go straight to scrap. Grinnell Fittings always bring all around satisfaction.

Send us an order to-day.

and brick construction, will be 559 feet long and 160 f wide. Some idea of the size of this building, which will from one to five storeys high, may be gathered from the f that 2,000 tons of steel will be required in the building, a forty cars of cement will be used in the foundation alone.

Owing to the speed with which the construction is to rushed, the board of control has had to make arrangeme for a water supply and sewer connections; also the constr tion of a piece of roadway on Kenilworth Avenue in or that material may be taken to the site.

The parent company are located in Charlestown, W Virginia, and the local plant will supply the Canadian tr with its product, which largely replaces plate glass. It is only process of manufacture where the glass is rolled for purpose. The company will employ between two and th hundred workmen on the initial staff. All of these skilled. No unskilled or foreign labor is employed in the p cess of manufacture.

The officers of the company are: S. B. Henshaw, Char ton, W. Va., managing director of the American Libb Owens Co.; William Ford, Toledo, director of the Ameri Libbey-Owens Co., and director of the American Libb Owens Bottle Co.; Ralph King, Toronto, director of the D inion Glass Co.; J. T. Richardson, Toronto, barrister, a John W. Hobbs, managing director of the Consolida Plate Glass Co., who will also be the managing-director the Canadian Libbey-Owens Co.

New Flour Mill

Markham Milling and Manufacturing Limited, Will Oper Plant in January

A new member of the cereal industry is the Markh Milling and Manufacturing, Limited, whose mill at Markh Ontario, is being completed in order to start operations the first of the year. The building is three-storey, 40 x feet, of cement construction, and will be fully equipped w modern machinery. Hydro power is to be used. A daily put of one hundred barrels is expected. Flour, buckwh flour, crushed oats, feeds, etc., will be the products. The c pany plan to manufacture for both the home and the fore market. They are capitalized at $100,000.

New Canning Firm

O. U. G. Fruit Products, Limited, Now in Operation Vernon, British Columbia

The O. U. G. Fruit Products, Limited, are a manufactu company affiliated with the Okanagan United Growers operating a plant at Vernon, British Columbia. The prod of the company are apple sauce, apple butter and apple j canned apples, pasteurized and concentrated cider.

The building in which the fruit products are made i shaped, having a frontage of 130 feet on the C.P.R. t This part of the building is 40 feet wide, and the wir 120 x 50 feet. The plant, fully-equipped, cost about $4(and manufacturing operations commenced at the en September. W. A. Ferguson, manager of the company, s that they expect to run a full line of canning next year present about fifty hands are employed.

New Tire Factory

Tiger Tire & Rubber Company, Limited, Will Op Plant in Belleville, Ontario

The Tiger Tire & Rubber Company, Limited, expe commence the manufacture of auto tires and tubes at B ville, Ontario, early this month. They have erected a fa there 250 x 60 feet, and will employ about twenty-five at the start. H. H. Hastings is general manager of the pany. The capitalization is $2,000,000.

New Motor Company

Winnipeg Motor Cars, Limited, Altering Buildings for the Manufacture of Motor Cars.

Winnipeg Motor Cars, Limited, are a company incorporated under the laws of the Province of Manitoba, with authorized capital of $1,000,000 to manufacture motor cars in Winnipeg. The company have purchased property on Marion Street from the Rat Portage Lumber Company, Limited. This is a site of three acres with buildings which are now being altered to answer the requirements of motor manufacturing.

F. A. Ogletree, president of the new company, states that the car to be made will be a four cylinder model priced at $1,700. Coupés, sedans, roadsters and touring cars are planned and a 1½ to 2 ton truck may be added to the list in the near future. The car will be known as the "Winnipeg."

Officers of Winnipeg Motor Cars are: F. A. Ogletree, president; L. Arsenault, vice-president; C. L. Lane, mechanical superintendent; and D. E. Ogletree, secretary-treasurer.

To Build at London

The W. T. Rawleigh Company, Limited, Will Erect New Factory Next Year.

The W. T. Rawleigh Company, Limited, manufacturers of flavoring extracts, spices, toilet preparations, proprietary medicines, etc., have purchased land in London, Ontario, and will erect a factory there next year. Plans for this building are somewhat indefinite at present but it will probably be about 75 x 200 feet, with six storeys and basement. In addition one or two small buildings may be built.

The W. T. Rawleigh Company have been located in Canada for several years with a manufacturing establishment at Winnipeg and sales and shipping branches at London, Ontario, and Montreal. They are a branch of the company of the same name at Freeport, Illinois, but the Canadian business is entirely separate from the United States firm. The plant at London will give employment to about one hundred hands.

Manufacturing at Elmira.

A. Hemme Sons & Company, Limited, Have Plant Once Occupied by Ideal Shoe Company.

A. Hemme Sons & Company, Limited, are a firm, incorporated this year, who are manufacturing animal traps, root seeders and weed-destroying machines at Elmira, Ontario. Their factory is a brick building 28 x 133 feet, two storeys high for 45 feet, and one storey for the balance. It was formerly occupied by the Ideal Shoe Company.

The company plan to enlarge their plant next spring and they will then erect a moulding shop. The number of employees is at present eight, but this is to be increased in the near future.

New Pulp Mill

Gaspereau River Light, Heat & Power Company, Limited, Building Plant at Wolfville

Among new pulp-making organizations are the Gaspereau River Light, Heat & Power Company, Limited, who are constructing a plant for making ground wood pulp at Wolfville Nova Scotia. The company expect to commence manufacturing about the first of next year with an initial force of about twenty-five employees. Their mill will be equipped with one 30-inch grinder having a capacity of from eight to ten tons of dry pulp a day. C. H. Wright is president of the Gaspereau River Company, and R. A. Godrey is secretary.

Equipment for Kitchens

Our equipment for Kitchens is built on the sound Manufacturing experience of more than three generations. This extensive experience has covered an immense field. With it, we are in the admirable position of possessing a measure of understanding unexcelled amongst Canadian Manufacturers.

In the specialized line embracing equipment for Cafeterias, Hotel and Institutional Kitchens you will find that the confidence of the Canadian householder has extended to the architect and buyer of this equipment. This, because we have carried into this exacting line all the skill and valuable experience so strongly emphasized in "McClary's Good Stoves and Cooking Utensils."

Over a number of years we have supplied complete equipment for large Kitchens in Canada, from coast to coast. Our Manufacturing facilities have enabled us to meet the varied and complicated needs so often called for, by buyers of this equipment.

Wherever there is time saved, labor minimized, overhead expenses reduced, McClary's appliances are almost certain to be a partner in this task of producing greater efficiency. Your problems may look to you insurmountable; permit us the opportunity of assisting you to face them, unravel them, and satisfactorily adjust them.

Our experts are at your command and will gladly submit prices and blue prints for any specification submitted—write us.

A Visit to the Peace River District

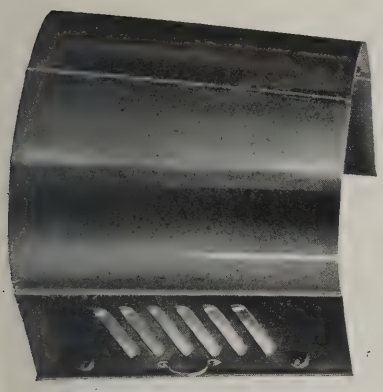
By JAS. B. THOMSON

Chairman, B. C. Division, Canadian Manufacturers Association

A PARTY consisting of the president and vice-president of the Vancouver Board of Trade, accompanied by some twenty-three members and press representatives, visited the Peace River district recently. They went from Vancouver by the Canadian National Railway as far as Edmonton, and then took the Edmonton & Dunvegan Railroad to Peace River Crossing, where the first stop on the tour of inspection was made, and the surrounding district of the Crossing was examined by the party. After spending two days at the Crossing, motors were taken by the entire party for a point known as Spirit River, a distance of about ninety-two miles. From the Crossing to Spirit River some idea was given of the vast future for this great agricultural country in what was already demonstrated in the very great expanse of oat and wheat fields that could be seen from the road. Particularly was the eye caught by what is known as Water Hole District, where settlement was more intensive than the average and hundreds of farms with good substantial homes and barns could be seen on either side of the road toward Dunvegan.

Arrival at Spirit River

Arriving at Dunvegan the party took the Government ferry across the river and from there, for a distance of seventeen miles, travelled through a very fertile country into Spirit River. The Board of Trade there royally entertained their guests, the Vancouver Board of Trade, and gave them every opportunity to see what it was possible to produce in that district. One could not help but be surprised to find that in addition to growing grain, as fine vegetables as could be found in Canada are also grown. We found potatoes, turnips, parsnips, leeks, peas, cabbage, cauliflower and tomatoes equally as good as can be grown on the coast line of B.C.



From Spirit River the train was again taken to Grande Prairie, which is the largest of any district there, from a population and agricultural standpoint, that was visited by the party. Some 160,000 acres of grain have been harvested this season in that section alone. The Peace River is not, as many thought, a barren Northland. It was unfortunate that, owing to the heavy rain which preceded the visit, the roads were utterly impossible to traverse between Grande Prairie and Pouce Coupe, but during our visit at Grande Prairie we had the opportunity of meeting many who had travelled and knew the Pouce Coupe district well and assured us that this district was equally as good as the points we had visited. While possibly owing to the immense Dominion Government Reserve of 3,500,000 acres held in that district there was not for the present as much land available as across the Alberta line, still there were thousands of acres awaiting settlers there to harness them for agricultural purposes.

The banks of the Peace River are very high; from the bed of the river to the plateau, they average from about 1,000 to 1,200 feet. The country is not like what one who is familiar with the middle west prairies would think. It is thousands of acres of what might be termed prairie land, but it is not the usual flat ground you see from the main line of the transcontinental roads. It is beautiful, pictures of rolling land more like England and Scotland, and also as

Steel work for Steam Power House recently erected for
The Dominion Power and Transmission Co., Hamilton, Ontario

the green, fertile appearance of Ireland with a sufficiency of poplars and willow trees to make it more attractive than the dreary outlook and continual sameness that one imagines the prairies to have. There is an abundance of small lakes and streams to meet all requirements without having to resort to irrigation to grow crops, and an abundance of wild grass and meadow land to support many thousand sheep and cattle with the protection against the winter of the woods here and there as required, which is not afforded by the further east prairie.

How many settlers are there in the Peace River District is a very common question. Bishop Robins, of Peace River Crossing, stated that in a conservative estimate he would say there were 25,000 people already settled in that district. Small towns we have mentioned have from 800 to 1,500 inhabitants. Grand Prairie District alone claims to have 160,000 acres of grain harvested this year. The other districts in proportion have a similar quantity. The crops average from 35 to 40 bushels of wheat per acre, while oats range from 90 to 120. The soil is a black loam with a clay sub-soil. One may have to travel miles to find even a stone. It has been within the war period that the majority of settlers have gone into the Peace River District, since the construction of the Edmonton & Dunvegan Railroad, but while the war was on conditions were not normal. Prices of all commodities were very high and the products of the farm was, and is to-day, away beyond normal value. Consequently, up to the present the agricultural products of the Peace River District have been able to reach the market even from as far north as Fort Vermilion, 300 miles beyond Peace River Crossing, where you find wheat and oats produced as fine as anywhere in Canada to-day. However, every settler whom our party spoke to were firmly of the opinion, as we were after viewing the situation, that, unless some direct communication were established between that district and the Port of Vancouver on the Pacific Coast, when conditions became normal again, it would be absolutely impossible from a transportation standpoint to be able to compete in the markets of the world by the present outlet through Edmonton which means a long distance haul from Pouce Coupe clear through to Fort William. With the present freight rates and the advances thereon, it would be utterly impossible to market at a profit anything one could produce in this fertile country part of which is situated in our own province and the other part almost against our boundary line. While it is true each particular district have their own idea as to how the outlet should go, they were all decided on the one main point, that the market for their produce was through Vancouver, to be distributed to the cities in the United States and also to the other countries across the Pacific, rather than to the Atlantic seaboard, which meant several thousand miles transportation added to the cost of the product.

To all of us in British Columbia it means an immense growth to our outlet for merchandise if we have direct communication with this wealthy district. It must also be remembered it is not alone the agricultural district we are tapping, but we are tapping some very rich mineral fields of iron, coal and precious metals. Geographically situated as we are, we are the outlet for the entire production of this immense unknown country which will be as great as any of the Prairie Provinces where already they can produce foodstuffs both in cereals, dairy products, beef, mutton, hogs, etc. To get this stuff coming through our ports means that the requirements of these people will be purchased from our local manufacturers and wholesalers, and that we will have through the handling of this produce to other parts of the world, increased activities in our shipping and other facilities all of which will tend to develop to a greater extent our fair province.

It must also be borne in mind that the Peace River District has not, as many suppose, a very severe climate. I

WHY YOU SHOULD USE PATHESCOPE SERVICE

Pathescope Films are effective
Pathescope Circulation is selective

Pathescope films are prepared by experts who have made a study of the screen medium—men with a breadth of vision, who can work out business problems by the picture method in a most effective manner.

Including as it does a selective urban and rural circulation, there is no other picture medium available in Canada which equals Pathescope Service. With this service, you can reach practically seventy-five per cent. of the towns and cities from coast to coast. Long after the pictures are seen, your message will be talked of and discussed in many homes.

Take Your Plant to Your Prospect

Your selling problems can also be solved by equipping your salesmen with a handy Victor Safety Cinema. Films showing your manufacturing processes, and demonstrating the various uses of your product constitute a forceful appeal and will materially assist your salesmen in securing sales not otherwise possible.

The Victor Safety Cinema can be used any time, anywhere, by anyone. This portable, projecting machine is endorsed by insurance underwriters, for use without enclosed booth, and both machine and films carry the underwriters' label.

What Pathescope Service can do for you

- Demonstrate Shop Practices.
- Promote Welfare Work in the interests of employees.
- Increase Distribution.
- Strengthen Intensive Selling Campaign.
- Educate Consumers and Dealers as to uses and merits of products, etc., etc.

fact, we are told by those who have been there for y that outside of the very low-lying land against the r such a thing as frozen crops are not known. While it is they get it colder than we do in the winter, it is not co we are informed, than the climate in and around Cal The district benefits by the Chinook winds just as the s of Alberta does.

Therefore, the citizens of Vancouver and British Colu must boost for a direct railroad connection to take adva of our natural inheritance rather than see it drift to fi coffers of those in other parts of Canada who are n favorably geographically situated as we are to handl wealth of this Northland.

Table of Comparative Costs.

The Office Specialty Mfg. Co., Ltd., Publish Chart Sho Increased Costs of Materials.

The Office Specialty Manufacturing Company, Lir have published a chart showing the increased costs of va articles used in the manufacture of their products as pared with pre-war prices. The information shown by table has been compiled from data furnished by the pany's purchasing department and the increases are s in percentages. About one hundred items are listed as many of the materials are used by other manufact than the publishers of the chart, it should be useful reference work. The company state that they have a nu of these for free distribution and will be glad to suppl requests from manufacturers.

Capacity Greatly Increased

K. & S. Tire and Rubber Goods, Limited, Extend N Purchased Plant

K. & S. Tire and Rubber Goods, Limited, have purc the plant at 99 Paton Road, Toronto, formerly owned b Canadian Carbon Company, Limited. About three ac land with modern buildings were acquired by this pur and considerable extensions made to the buildings ga company about 100,000 square feet of floor space. The is fully equipped with a sprinkler system and mode every respect.

The buildings will be used for the manufacture of mobile tires and tubes, and other smaller rubber goods. completed, the plant will have a capacity of over 300 1,000 tubes, 3,000 hot water bottles and 10,000 small of druggists' rubber sundries per day, or five times th vious capacity. The addition should be finished an machinery installed by the first of January. The tot of land, buildings and machinery is approximately $7

The company have found their business in druggis ber sundries the most favorable in recent months. In lines an increase of 244 per cent. for the past nine of this year is shown as compared with last year. T mand for druggists' sundries is better in the domest in the foreign field. The tire business has not increas ing the year and the domestic demand is not so good s export.

Steel for Permanence

The All Steel Elevated Water Tank is the most economical installation for Automatic Sprinkler systems for fire protection, general mill supply, or Municipal Water Works systems.

Its first cost is not excessive, the maintenance expense is very low, and there is no danger of leakage, falling ice, or possibility of the tank bursting or catching fire.

Hundreds of our All Steel Elevated Water Tanks now in service throughout Canada bear witness to these facts.

Difficulties in the Export Trade*

An Expert's View

MR. R. C. TOWNSHEND, of the Merchandise Sales Co., Ltd., who represent in Great Britain many large Canadian manufacturers, has just returned from a visit to Canada, made with a view to enlightening the firms which his company represent, as to conditions and requirements of the British market. When seen by a representative of the *Canadian Gazette*, and asked what he thought of the present state of Canadian trade with Great Britain, Mr. Townshend said:

"So far as my experience goes, I do not think that Canada is doing the trade she might do with this country, and with Europe generally. There are several reasons for this. The present rate of exchange is very detrimental and is in a great measure responsible for present conditions. Moreover, it causes irritation to the buyer, for it is impossible to estimate the cost of goods either one way or the other until one actually has them in stock. A great deal of this trouble could be eliminated by having a fixed rate of exchange between the Canadian manufacturers and the buyers on this side.

More Attention to Export Trade Needed.

"During my visit to Canada I urged upon the manufacturers there whom I met to give more attention to the British market. I have had many years of experience of business both here and in Europe and in Canada, and this enables me to put my fingers on the weak points in Canadian methods. Manufacturers might with advantage take more care of the export trade and give less attention to the home market, which owing to the protection given to it by the import tariff against outside competition, does not need the careful study and consideration that must be given to the export trade if it is to be successful. Finish is also a most essential factor. The rough and ready style which satisfies Western needs does not meet the requirements of British or European ideas of finish. It is to the interest of the Canadian manufacturers and for the future development of trade that they personally should pay a little more attention to the finish of the goods they export, however cheap they may be. Packing is also important and must not be treated with contempt.

"On the other hand, it must not be forgotten that Canadian manufacturers cannot help some of the faults that are charged against them, such as delays in delivery of goods sold. The great difficulty of obtaining raw material in the past twelve or fifteen months from various sources has been a great handicap in Canada, as in other manufacturing countries, but this trouble is gradually being overcome. Personally, I think the Canadian manufacturer, at least those whom I have met, is a very business-like and intelligent man, conversant with his own and the immediate market but very indifferent to the markets and to buyers far from his door. He should therefore in that case put a little confidence in those who are working these far-off markets for him, by assisting in all trifling matters which crop up from time to time. It is not what is actually done to-day that matters so much; it is the results which follow in years to come. The following little verse should be conveyed to memory:

> "'Shall we be missed though by others succeeded,
> Reaping the fields we in springtime have sown?
> Yes! but the sower must pass from his labors,
> Only remembered by what he has done.'

"There is one vital point in which the American and German exporters are far in advance of the Canadian. Bo

the former flood the markets which they are after with ad vertising literature, catalogues and pamphlets of all kinds and they do not stint along this line. Take my own case In this country alone there are close on seven hundred firms and double that number abroad, to whom we should send advertising matter; but we are unable to get the necessary catalogues. This is a great mistake, as manufacturers will learn too late if they are not careful. Indent houses on the British market are the people who get in touch with the out lying places of the world, and unless you can feed them with the necessary literature you must not expect results. This has very forcibly been brought home to me personally of late

Looking Ahead

"Canadian manufacturers must strive, by sacrificing a little, to secure a good name abroad for their products, and they can only do this by having competent salesmen who know not only their own market requirements and prices but those of countries in which they are working. Manufacturers should assist their agents in every available manner Canadian products for export should be at least 10 to 15 per cent. cheaper than those sold in the home market. Perhaps this remark will create some protest on the part of Canadian manufacturers; but they must not forget their protective tariff, and that the largest market of the world is free to all customers who like to cater for it. There is no doubt about it that Canada has a great future ahead of her. My own belief is, that if we go about our business to-day in the right way we are bound to succeed."

Engineers Celebrate Anniversary

American Society of Mechanical Engineers founded forty years ago this fall

The fortieth anniversary of the founding of the American Society of Mechanical Engineers was celebrated by the Ontario section of the society at a meeting in the School of Science building, Toronto, on November 5th. Telegrams were read from the parent society in New York and from a number of local sections in the United States, and other engineering bodies expressing the cordial feeling between engineers and congratulations on the fortieth birthday. There was also received a cablegram from the Institution of Mechanical Engineers of London, England, reading: "Heartiest greetings on occasion fortieth anniversary; events recent years which demonstrated importance of engineers to civilization and established their power in industrial world indicate necessity for continued expansion of engineering societies activities Signed, Institution of Mechanical Engineers of London."

Prof. James Trail gave an illustrated talk on the power canal of the Chippewa development of the Hydro-Electric Power Commission. This was specially arranged as advance information for the members, who have been invited by the Commission's engineers to visit the canal. This trip to Niagara was to take place within a few weeks.

After the lecture, an attempt was made to get in touch by wireless telephone with the Boston section of the A.S.M.E. who were expected to be sending out messages in connection with their part of the anniversary celebration. The local receiving apparatus, under the care of Messrs. Rosebrugh, Duncan and Hill of the Faculty of Applied Science of Toronto University, was working perfectly and picked up messages from a number of sources, but none from Boston. The audience listened through multiple telephone receivers to a concert received over the wireless telephone and were much interested in a description of war-time wireless by Mr. Duncan. As the expected Boston message later came in by ordinary wire it would appear that the local electrical engineers had done their full duty.

Business Conditions Justify Optimism.

By S. J. FRAME

VIEWING world conditions generally, all indications point in the direction of the peak of high prices having been passed. Involved in the present world movement of prices is a curtailment in the purchase of luxuries.

This is a healthy sign, as while it results in unemployment in the luxury trades, which re-acts on business generally, it is a blessing in disguise, as this had to happen sooner or later in order to ultimately swing over to trades making essential goods, large numbers of work people who have been producing luxuries, thus at the same time stabilizing the labor market and helping to restore normal conditions.

The situation can be viewed with equanimity, as it only means that manufacturers and merchants will have to adjust themselves to the new conditions by striving for increased efficiency in manufacturing, sales and collections, the standard of efficiency having deteriorated during the extraordinary wartime conditions.

An optimistic view is the only one that is justifiable. Yet, at the same time, calmness and good judgment are at present required in a marked degree. Caution, to a certain extent, is also necessary. A due sense of proportion needs to be maintained though, and caution not be allowed to degenerate to a point where, instead of its being caution, it is really indecision and unnecessary fear. Nor should the manufacturer or merchant, who now actually requires goods, stay out of the market on the expectation that prices will decline. Such an attitude is against the true principles of buying, and is simply gambling on the market. He, at the same time, runs the risk of letting his stock be reduced to a dangerously low point, too low for safety.

Such an attitude also tends to make trade conditions worse, whereas everybody should be doing all he can to improve them.

If he now needs goods, it is his business to buy them, and let the market take care of itself. "Sufficient unto the day is the evil thereof."

On a declining market, the buyer cannot always expect to hit the low point, and at the same time keep his stock up to the proper size. If he should happen to hit a high spot in the market, he must remember that that will have to be averaged against the many times in the past few years that he has had the advantage of a rising market.

The manufacturer and merchant who expects to stay permanently in business, and who, uninfluenced by what others are doing, carries out the above principles, in both buying and selling, cannot go very far astray; and the length of time required for the restoration of normal business conditions will be determined to a very great extent by the degree to which such principles are carried out by the business world.

In conclusion, anyone viewing the situation in the proper perspective, cannot, notwithstanding any temporary slackening, take any other than a cheerful view of prospects for trade in the future in countries possessing such vast resources as do Canada and the United States.

The Crouse-Hinds Company of Canada, Limited, have brought out a new bulletin, No. 1000 N, which illustrates recent types of condulets. The various types of the "Mogul Obround Series" are described in the booklet and details of size, weight, price, etc., are given.

Meeting of Chemists

Society of Chemical Industry of Great Britain Will Meet in Montreal and New York

Following the annual meeting of the British Society of Chemical Industry to be held in Canada next autumn English-speaking chemists from all parts of the world will meet in New York with the American Chemical Society. The Montreal section of the Society of Chemical Industry of Great Britain will be the host at the annual meeting.

The joint meeting is a direct outgrowth of the closer relations that have sprung up among Anglo-Saxon chemists as a result of the war. One of the objects in view is to form a coalition to oppose the German chemical industries that previously to 1914, dominated international trade.

Packing Plant Closes

Armour and Company Decide to Discontinue Canadian Business for the Present

Owing to the loss of the export market and the high prices of hogs, Armour and Company have found it necessary to close their packing plant at Hamilton. While discontinuing business in Canada for the present, they hope to resume operations when conditions are favorable for conducting their plant on a paying basis.

In a circular letter to customers, the company say:

"While the lack of export market and the high prices of hogs are the immediate causes for cessation of operations. there is another underlying handicap to the success of packing operations at Hamilton. Due to the small margins on which we operate large volumes are essential in our business, and the production of hogs in the Hamilton territory has not been sufficient to enable volume operation. We have always felt, and we still believe, that this territory can produce good hogs in abundance, but it is not being done now. Our plant has been operated for a long time on a basis far short of its capacity, and this has greatly increased the overhead expense which each animal necessarily has to bear. That made it impossible for us to compete with plants more favored as to volume; it is the part of good business, therefore, to close the plant.

"Cessation of operations is being brought about gradually as stocks are cleared out. Some of our employees will remain with us and be transferred to other places, and others are being released so as to enable their gradual absorption in other industries.

"We look forward to the time when we can resume operations here and be more than ever a factor in the industrial life of Canada, but in the meantime we take this opportunity to thank you for the patronage you have given us in the past and hope to be again favored with your business when our plant is re-opened at some future date."

Gift to Hospital

H. W. Petrie of Toronto Endows Brantford Institution for Five Years

H. W. Petrie, president of H. W. Petrie, Ltd., Toronto, has remembered his old city, Brantford, where he first started in business. The remembrance has taken the form of the setting aside for a term of five years of $25,000 Victory bonds, the interest to be paid half-yearly to the hospital. In his letter to C. H. Waterous, president of the Brantford General Hospital, Mr. Petrie pointed out that his "first business venture took place in Brantford, for which for many years I was a citizen, and, despite my removal some thirty years ago to

MONTREAL AND WINNIPEG

Toronto, the interests and developments of the place have always been very dear to me. In this regard I shall deem it a privilege to do something on behalf of your splendid public institution."

C. H. Waterous, in accepting the gift, stated: "Your citizenship here is still recalled with pleasure and profit by many old friends, who take pride in the success which has so worthily crowned your business enterprise and integrity, and who deeply appreciate that in the days of your well-earned prosperity you have decided to remember in so tangible a manner the place and the people associated with your early life and commercial efforts."

The Brantford *Expositor*, commenting editorially on this, remarks: "The hospital board has not received much encouragement of this kind in its labors, and the generous action of Mr. Petrie is consequently greatly appreciated by them. It is hoped also that it will prove an example to others."

Profitable Farming

Saskatchewan Farmer Retires on Fortune Made After Fifteen Years Work

Just how profitable careful, systematic farming can be made in Western Canada is instanced in the success of a disciple of Seager Wheeler, the wheat wizard of world renown, who has carefully followed in the footsteps of his model until, as the result of this year's crop, he finds himself in a position to retire, make a world tour, and settle with his family at Nice, Southern France. Such is the story published in *Agricultural and Industrial Progress in Canada.*

Coming from across the line, William Hopkins commenced farming at Kinhop, an elevator siding in Saskatchewan, on the Goose Lake line, in 1905, and, in the course of his operations, acquired 1,760 acres which he cultivated, summer fallowing 500 acres each summer. It speaks well for the country that in all these years he never experienced a crop failure, and in the only poor year recorded, that of 1919, the yield of the farm cleared all expenses.

The Premier Producing Seed

Three years ago Mr. Hopkins, a zealous student of scientific farming and a stern advocate of selective seed, purchased Red Bobs seed from Seager Wheeler, paying $32.50 per bushel for it. A year later he bought a supply of the Kitchener strain from the same source at $10 per bushel. Mr. Wheeler's wheat, it may be stated, is the premier producing seed of the world, having secured from his farm at Rosthern, Sask., several international world's prizes and achieving a world's record yield of 82 bushels per acre.

Results in Mr. Hopkins' case certainly justified the expenditure, and the fine type of crops produced previously were considerably enhanced by the plump heavy seeds which weighed over 65 pounds to the bushel. This year, the crop consisted of 50 acres of Red Bobs which yielded 45 bushels to the acre and 430 acres of Kitchener which returned 40 bushels from every acre. In contrast, 480 acres seeded to Marquis, which owing to circumstances it was found necessary to stuble in, gave a yield of 15 bushels to the acre.

Now Independent for Life.

This year, after threshing, having operated his land for fifteen years, Mr. Hopkins sold out to George Leonard, who had managed it for him for a number of years. The price of exchange was $80 per acre or a total of $140,800. His fifteen years' work has given him independence as well as a profitable income yearly. Toil for him and his family is over. This fall Mr. Hopkins and his family start out on a tour of Canada and the United States, the Mediterranean and other lands, and then will settle in the beautiful garden of the Riviéra.

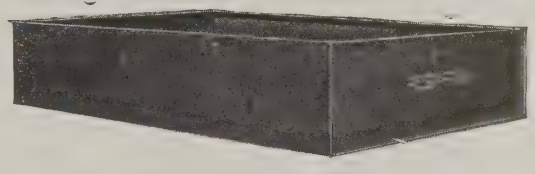
ROUND STEEL WELDED TANKS
Top End Open



Made any gauge iron up to ¼-inch plate, welded throughout, making them like a one-piece tank, therefore cannot leak. Formerly these tanks were riveted and, as they were made of black iron, they could not be soldered and were therefore very liable to leak, in fact the lighter tanks could not be made leak-proof, but the new welding process has changed all this and we can now give you a tank that we can guarantee absolutely. We specialize on heavy tanks for manufacturers, finished round top with heavy angle steel if so desired.

SQUARE WELDED STEEL TANKS

Made any size or shape to suit. Being welded throughout they are just like one piece of tank, and there is no chance of leakage as with the riveted tank. We can supply these up to ¼-inch plate. We finish them around top if desired with heavy angle steel and the larger ones with extra cross and upright braces. Can supply any necessary Pipe Fittings.

Also Air Pressure and Gasoline Tanks

Ontario's Hydro System

Hydro-Electric Development in Ontario. A History of Water Power Administration under the Hydro-Electric Power Commission of Ontario. By E. B. Biggar. Toronto: The Biggar Press, Ltd.

It was to be expected that sooner or later a history of so important a body as the Hydro-Electric Power Commission of Ontario would be written. Mr. Biggar has given us in this volume of 200 pages the story of the Commission and its work down to the present time. He has gone very fully into the whole subject of Hydro-Electric Development in Ontario and has collected material that possesses much historical value. The book is openly favorable to public ownership and in fact may be regarded as an argument in support of that form of administration of public services. Sir Adam Beck and his associates in the work receive eulogies of the most unqualified character.

Though containing of necessity a good deal of material connected with the legal aspects of the subject, which makes at best but dry reading, there is quite a fascinating account interwoven of the actual physical expansion of the electrical development at Niagara Falls, while the story of the inception of the movement which culminated in the appointment of the Commission is not without its human interest features. Niagara Falls, with its parasitical hucksters, peddlers and sharpers in the days before power development, stands in striking contrast with the prosperous cities of to-day, while the extent to which power is being radiated from this source fills the mind with wonder.

Considerable attention is devoted in the later chapters of the book to the subject of hydro radials and in fact to the whole question of the application of electricity to transportation. Mr. Biggar is already known as the author of "The Canadian Railway Problem," and writes with wide knowledge of the subject. He has no fears as to the success of hydro radials and sees in them an important factor in the solution of the general transportation problems. Seperate chapters are devoted to the use of electricity on the farm and to the power problem on the St. Lawrence, while an answer is given in the eighteenth chapter to the frequently reiterated contention that the legislation under which the Commission acts was designed to rob private companies of right and justice.

The book makes on the whole a very valuable contribution to the history of the Province of Ontario and should be of interest to members of the C.M.A. for the reason that manufacturers have all along been prominently identified with the movement for cheaper power, and have frequently served on both the provincial and municipal commissions.

The Reciprocity Movement

Reciprocity with Canada. A Study of the Arrangement of 1911. United States Tariff Commission, Washington: 1920.

Students of trade relationships between Canada and the United States will find this report of decided value. It contains three chapters and an appendix. The first chapter deals with the general character of trade and political relations between the two countries, early attempts at negotiation, the treaty of 1854, relations between the countries from 185 to 1910 and the negotiations of the agreement of 1911. The second chapter analyzes the latter agreement, while the third continues the historical account by telling of the disposal of the agreement and explaining the present status of the reciprocity movement. The appendix contains the proposed agreement and other reports and documents con

nected with it. The report as a whole is the first careful study of the effect on commerce that the measure would have had if Canada had accepted it.

The Commission outlines at some length the political situation in the United States and Canada at the time of the passage of the Act by Congress and notes what appears to be the present feeling towards reciprocity in the Dominion. In the United States reciprocity was in accord with a movement against high duties which was felt in both parties. The Republicans who were opposed to the tariff of 1909 might have been expected to follow President Taft in his support of the measure. These so-called "insurgents" came, however, largely from agricultural constituencies, and because the chief duties removed were on agricultural products, many of them voted against the bill as a discrimination against the farmer. Both the "insurgent" and the "regular" Republicans showed a majority against the bill; but sufficient Democratic votes were cast for it to effect its passage. Reasons for the defeat of the measure in Canada, in addition to the opposition of the interests directly affected, were numerous. Among them were resentment arising from the earlier attitude of the United States towards reciprocity, the strength of the idea of Imperial unity and the fear that the agreement was prompted by political motives, and would lead to an ever-growing dependence of Canada on the United States. Present Canadian support of reciprocity comes from the Liberal party and the Farmer-Labor party.

The report contains an extended statistical study of the effect which the agreement would have had, if adopted (1) at the time it was drawn up, and (2) at present. At the first date the value of imports into the United States from Canada which would have been put on the free list or reduced in duty, was $43,000,000; of those in the opposite direction, $33,500,000. The proportion of trade affected would have been, however, very different for the two countries. Of imports into the United States from Canada, 45 per cent. would have been changed, 5/6 of these going on the free list, the remaining sixth being reduced in duty; of imports into Canada from the United States, 15 per cent. would have been changed, 1/3 of these being made free and ⅔ reduced in duty. In the second comparison trade figures for 1918 are used as indicative of the present situation. The changes which the adoption of the treaty would make under the rates now in force in each of the countries differ from those just given, most markedly so in the case of imports into the United States. For Canada, the rates taken are those in force since May 19, 1920, not considering the excise taxes laid by the Dominion Parliament and enforceable from that date, falling upon imported goods as well as those made in the Dominion. In 1918 imports into the United States from Canada, which would have been affected amounted to $31,000,000; those in the opposite direction to $126,000,000. The proportion of trade affected is not so markedly different as before; of imports into the United States from Canada, 7.2 per cent. would have been affected, 23/24 of these being made free, the remaining twenty-fourth reduced in duty; of imports into Canada from the United States, 16 per cent. would be affected, ¼ of these going on the free list, the remaining ¾ being reduced in duty. The United States, the Commission concludes, would to-day be granting less of a concession to Canada through the adoption of the agreement now than at the time proposed, Canada a somewhat greater one.

The reason for the difference pointed out above between the effect of the agreement to-day and when proposed have been due, to a great extent, to the fact that the tariff of the United States has undergone a thorough revision, while the same tariff is in force in Canada as at the earlier date. Many changes, it is true, have been made, but these are slight as compared with the differences between the tariff Acts of 1909 and 1913. A second cause for the difference lies in the large increase in the value of the trade between the two countries since the outbreak of the war in Europe, an in

crease largely attributable to the rise in prices, although to some extent due to an increase in the commodities exchanged by the two countries.

Natural Resources Reviewed

The Resources of Nova Scotia. Compiled for the use of settlers and investors from material supplied mainly by Federal and Provincial Services. 1920. Natural Resources Intelligence Branch, Ottawa.

This is the latest of a series of booklets dealing with various sections of the Dominion, the booklets previously issued having covered New Brunswick, the Peace River, New Manitoba, Saskatchewan, etc. The opening paragraph clearly indicates the object of the series when it says: "The facts in this booklet are compiled for the use of the homeseeker, merchant, manufacturer, capitalist and visitor. They purpose to be up-to-date, authoritative, concise." Each booklet forms a basis of standard official information and is revised as each edition is exhausted. In the booklet now before us a welcome absence of verbiage allows space for valuable specific facts. Thus there is a list of products reshipped from Halifax which could easily be manufactured in Canada; a special section on West Indian and British Guiana trade, details about oil-shales, coal, limestone and iron, aeronautics, merchant marine, clays, salt, land prices and wages—all subjects of present interest. Statistics are made palatable by an interesting style and suggestive touches, and there are a number of excellent illustrations.

Advertising Canada

The Times Imperial and Foreign Trade Supplement; Special Canadian Industrial Section. London, Oct. 23rd, 1920.

An interesting sequel to the Imperial Press Conference and the Chamber of Commerce convention is the Canadian industrial section of *The Times.* Representative British journalists and business men had the opportunity this summer of learning about Canada's economic importance. *The Times* has compiled a review of Canadian industries that will go to all parts of the Empire.

Every important industry in the Dominion—agricultural, manufacturing and mineral, is considered. Special attention is paid to the development of hydro-electric systems. Banking and insurance, railway transport, shipping services and tariffs are dealt with in special articles.

One feature of the publication is an article by the editor of *Canada* in which the opportunities for British manufacturers are clearly set forth. "Conditions to-day in Canada are more favorable to the establishment of branch factories by British firms than at any previous period in Canada's history," he says. "British experience and British capital are desired by Canadians for the development of industry and any firms who take the trouble to investigate the opportunities and take advantage of the sound advice and assistance which they will find so willingly given cannot fail to profit thereby."

A Buyers' Guide.

MacRae's Blue Book. MacRae's Blue Book Company, 18 F. Huron St., Chicago, 1920. $10.

A comprehensive directory of manufacturing firms in the United States is MacRae's Blue Book for 1920. A volume of over 1,800 pages, it contains the names and addresses of twenty-six thousand manufacturers listed alphabetically under their firm names and under some twelve thousand classifications of products manufactured.

Other features are tables of miscellaneous data for the use of purchasing agents; a list of 15,000 trade names, showing the names and addresses of concerns manufacturing the articles so named, and a standard list price section. The volume should be useful to any buyer who wishes to get quotations from United States firms.

F. G. B. Allan

Pressed Metals Company of Canada, Limited, Have New General Manager

A change is announced in the management of the Pressed Metals Company of Canada, Ltd. The announcement is made in the form of the following letter sent to the directors of the company by President C. E. Calvert, on behalf of the executive:

"I beg to notify you that your executive committee has unanimously chosen Mr. F. G. B. Allan as general manager of the Pressed Metals Company of Canada, Limited, and American Bushings Corporation, succeeding Mr. J. W. Leighton.

"Mr. Leighton is now chief engineer and supervisor of works, and will devote the major portion of his time to the development of our patented bushings and tube processes.

"Mr. Allan's experience and qualifications should admirably fit him for the position of General Manager."

Mr. Allan, who is a Toronto man, is a son of the late Hon. G. W. Allan. It is expected that he will co-ordinate the various departments of the company in an effective manner. Mr. Leighton is the inventor of the bushings, which has been the principal product of the company.

Henry D. Fleming

Resigns the Presidency of Canadian Collieries (Dunsmuir) Limited and Allied Companies

Henry D. Fleming, chairman of the executive of the Canadian Collieries (Dunsmuir), Limited, has resigned from the presidency of the company and its allied companies, it having been decided by the board and the bond-holders committee that the executive management of the company should in future be wholly centred in British Columbia. This will be in the hands of J. M. Savage, who remains as general manager of the company with a seat on the board. Mr. Savage also becomes president of the Wellington-Comox Agency, Limited. F. Perry, of Montreal, vice-president of the Canadian Collieries (Dunsmuir), Limited, has been elected to the presidency of that company, and H. B. Walker, also of Montreal, has been elected to the vice-presidency.

J. F. MacKay

Secretary-Treasurer of Willys-Overland Appointed Vice-President of John Morrow Company

The appointment of J. F. MacKay as vice-president and general manager of the John Morrow Screw & Nut Company, Limited, was announced in the newspapers of October 30th. Mr. MacKay has resigned his position as secretary-treasurer of Willys-Overland, Limited, and has moved to Ingersoll, Ontario, to take over his new duties.

In going to Ingersoll Mr. MacKay returns to a familiar part of Ontario as he was for some time associated with the late Andrew Pattullo in publishing the Woodstock *Sentinel-Review* and spent most of his youth in that neighborhood. Since 1903 when he became business manager of the *Globe*, he has lived in Toronto.

E. A. Mott

New Director is Added to the Board of the Cockshutt Plow Company, Limited

One change was made in the officers of the Cockshutt Plow Company at the annual meeting in Brantford, on November 10th, E. A. Mott being added. The directors now are

Col. H. Cockshutt, George Wedlake, G. K. Wedlake, Sir Augustus Nanton, E. A. Mott, Sir Lomer Gouin, H. W. Hutchinson, James Adams, F. Perry.

The reports presented were reported as very satisfactory to the shareholders.

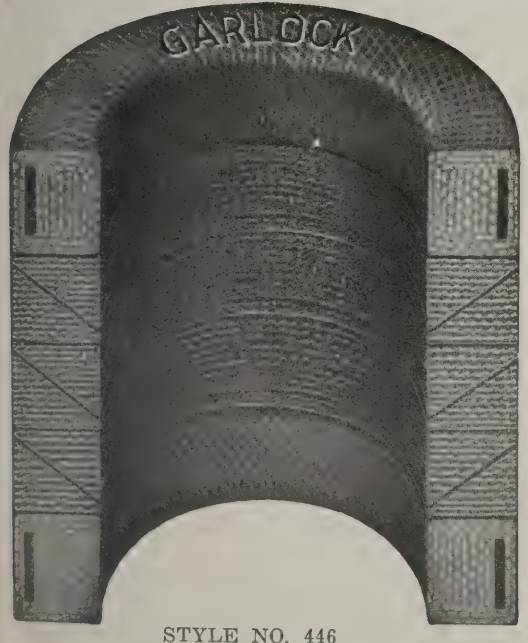
Mr. Mott will not sever his connection with the West, but will visit the territory frequently in order to keep in touch with the large Western interests of the organization through his western branch houses. His wide knowledge and experience of Western conditions will be invaluable at the head office of his company.

During his twenty-eight years in Winnipeg, Mr. Mott has been active in the general commercial life of the city. He is a past president of the Winnipeg Board of Trade, and has been honorary secretary-treasurer of the Winnipeg General Hospital for the past six years. He has been a member of the executive of the Manitoba Red Cross and has been identified with many movements in civic development; also is one of the originators of the Winnipeg Wholesale Implement Association.

Sir Thomas Tait, of Montreal, has been elected president of the Canadian Salt Company, Limited, Windsor, Ontario, in succession to the late E. G. Henderson. Sir Thomas had previously been vice-president. Mr. Duck, who has been with the company for the past twenty years, and was closely associated with Mr. Henderson, has been appointed acting manager.

At the annual meeting of the Russell Motor Car Company, Limited, held in the National Trust Building, Toronto, on October 29th, the former directors and officers were re-elected.

David J. Buckley



Prominent Lumberman Dies at His Home in Newcastle, New Brunswick

A prominent and highly-respected lumberman of the Province of New Brunswick passed away recently in the person of David J. Buckley, of Newcastle. He was one of the leading lumber operators and mill owners in the Miramichi district, and had been in failing health for several months.

The late Mr. Buckley was fifty-six years of age, was the sole owner of the large plant at French Fort Cove and also the Nordin mill. Mr. Buckley originally operated a large mill at Rogersville, N. B., and in 1911 erected the plant at Newcastle, which has a capacity of about 9,000,000 superficial feet a year.

Mr. Buckley was chairman of the Lumbermen's Association for Northumberland County, and had a thorough, practical knowledge of the various ramifications of the industry. He was a member of the Crown Lands Advisory Board, which was established in 1918, being the representative of the lumbermen of New Brunswick on that body. He was also the first president of the Lumbermen's Protective Association from the presidency of which he retired in June, 1918.

Mr. Buckley was a man of keen business instinct, high sense of honor, and one of the most successful operators in the province. Surviving him are three children, two daughters and one son, L. W. Buckley, who has been associated with his father for a number of years in the business. Mr. Buckley's mother also survives him and resides in Moncton. The funeral, which took place from his late residence to St. Mary's Church, Newcastle, was attended by lumbermen, who took occasion to pay their last tribute of respect to one who did everything in his power to further and uphold the standing and welfare of a great industry.

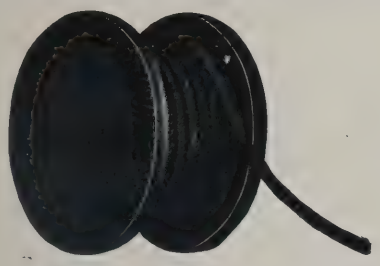
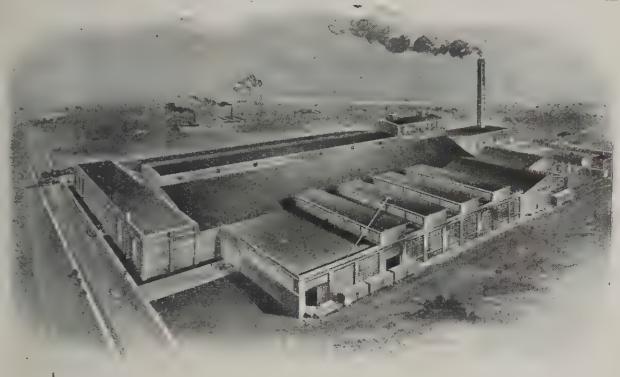
Large Cargoes Being Carried to Various Ports by Ships of This Line



The development of the South American service of Canada's merchant marine is proving of great value to the export trade of Canada, especially to the manufacturers. On October 31st, the *Canadian Victor*, one of the Canadian Government Merchant Marine's largest and best equipped vessels, sailed from Montreal with a full cargo and passengers, bound for Rio De Janeiro, Santos, Montevideo and Buenos Aires, and a glance through the manifests of the 8,000 tons of cargo carried will show what the Merchant Marine means to the development of foreign trade. Large amounts of agricultural implements, and machinery of Canadian manufacture are in her hold destined to Rio De Janiero, Santos, Montevideo and Buenos Aires. Then there is a large consignment of barbed wire for fencing the large grazing lands of the Argentine destined to Buenos Aires; large quantities of bar iron; automobiles in crates, automobile tires, fittings, etc.; rolls of news print, cases of phonographs; cases of rubber goods, such as syringe tubing, tobacco pouches, balls, etc.; cases of patent medicines; biscuits; cases of chocolates and confectionery; cut glass; large amounts of spruce boards and chains for Buenos Aires; electrical fittings, wooden spools, and reels of lead covered cable and transformers. A glance over this list of manufactories shows the growing trade between Canada and South America.

There is again the possibilities of considerable new foreign trade to India, Straits Settlements and the East Indies, which the joint service of the Canadian Government Merchant Marine, Limited, and the British India Steam Navigation Company has opened up This service was inaugurated by the S.S. *Canadian Pioneer*, which sailed from Montreal on September 11th, and is now in the Indian Ocean, having discharged her cargo at Kurachi, Bombay, Colombo. She is now on her way to Madras. She is being followed up by the S.S. *Boyne* of the British India Steam Navigation Company, Ltd., which sailed November 6th from Montreal. The *Canadian Pioneer's* cargo is worth examining to get an idea of the new trade with the Far East. The principal items of cargo on the manifests are automobiles and automobile parts, tires, etc., destined to Bombay and Calcutta, and other parts of the East; various machinery; oil stoves; wire nails for Batavia, and a large consignment of acetic acid for Bombay; crates of wire screens; bicycle parts, etc. This service will surely grow as the goods become circulated among our friends in the Far East.

Steady development is taking place in trade with the West Indies and Cuba, fostered by the efficient service of the Merchant Marine. Then again the ships of the Merchant Marine are open for charter to carry whole cargoes of grain, pulp, and the products of farm and forest. The *Canadian Mariner* leaves St. John, N.B., December 5th for Genoa, Italy, with a full cargo of grain, while the *Canadian Squatter* and the *Canadian Volunteer* are loading cargoes of pulp in the Saguenay for Rouen, France.



The passenger business of the Merchant Marine, although not yet very widely known, is being taken advantage of by manufacturers. The boats in the South American, Indian and also in the Vancouver-Australian runs have limited accommodation for cabin passengers; this accommodation being of the very best, and being placed on these ships with a view to facilitate sending representatives of our manufacturers to the countries where new trade is being opened.

New ships are being added monthly to this growing fleet and as each boat is turned over, a cargo is found for her, and she becomes an earning power for the Canadian Government Merchant Marine, Limited, and a help to the manufacturers

of Canada. The following ships have lately been delivered or are being delivered shortly: S.S. *Canadian Squatter*, 4575; *Canadian Carrier*, 4575; *Canadian Runner*, 4575; *Canadian Rover*, 3890; *Canadian Mariner*, 8100.

The two ships which will perform the passenger service between Halifax, N.S., Nassau, Bahamas and Kingston, Jamaica and Balize, British Honduras, early in January, are now nearing completion, the *Canadian Fisher* having already left Three Rivers for Halifax, and the *Canadian Forester* is expected to leave in a few days. At Halifax the passenger accommodation will be completed and the vessels turned over, and placed in service. These vessels are to be equipped with first-class passenger accommodation, having ten state-rooms, all situated on the bridge deck, and with two suites, each consisting of large bedroom, parlor and private bathroom. There is to be a spacious music room also situated on the bridge deck, and a comfortable, well-appointed smoke room. The dining-room situated on the upper deck will also be comfortably furnished, its chief feature being its series of tables for small parties. This service being the only service from Canada to Nassau and Kingston, Jamaica, and British Honduras, should soon become very popular both with the tourist and business man.

An Industrial Number

St. Maurice Valley Chronicle Publishes a Survey of Recent Industrial Development

The *St. Maurice Valley Chronicle* published its 1920 industrial number in October. In it an account is given of the various industries which have played such a large part in the development of Three Rivers, Shawinigan Falls and Grand' Mère. These include such firms as the Wayangamack Pulp & Paper Company, the Wabasso Cotton Company, and the Tidewater Shipbuilders at Three Rivers; the Northern Aluminum Company at Shawinigan Falls, and the Laurentide Company at Grand' Mère. The expansion in manufacturing establishments during the last decade gives support to the *Chronicle's* claim that the St. Maurice Valley is "the industrial heart of Quebec."

Banking Statistics

Increases in Current Loans and Savings Deposits Shown in September Statement

The bank statement for September 30th, 1920, shows an increase of about 7 per cent. in savings deposits, and a large increase in current loans. The latter is largely due to credi needed for crop moving purposes. The principal items of th September statement are:—

	Sept. 30th, 1919.	Aug. 31st, 1920.	Sept. 30th, 1920.
Deposits on demand	$650,743,015	$640,361,707	$677,286,9
Deposits after notice	1,227,437,715	1,261,647,732	1,270,194,0
Current loans in Canada .	1,058,572,202	1,385,470,163	1,417,520,7
Current loans elsewhere .	151,814,511	200,945,241	202,590,1
Loans to municipalities .	57,033,309	79,912,041	78,103,3
Call loans in Canada ...	96,912,709	113,598,923	114,669,6
Call loans elsewhere	169,532,489	193,888,245	186,962,9
Circulation.	229,532,356	237,697,647	242,988,8

Nearly five hundred men are employed on the constructi of the main canal of the Osoyoos Settlement for Return Soldiers, five and a half miles of which have already be completed at a cost of about $750,000. The ditch on compl tion will be about sixteen miles in length. The area acquir by the Government for the purpose of settling soldiers co prises 22,000 acres of which 13,000 acres are irrigable, a the cost to the province was $350,000.

Recent Trade Enquiries

A List of Enquiries Received from Various Sources including the Canadian Trade Mission, London; the Canadian Trade Commission, Ottawa; the Department of Trade and Commerce, Ottawa; and the Commercial Intelligence Department, C.M.A., Toronto.

DOMESTIC.

578. Maritime Provinces: A firm in Halifax, Nova Scotia, wishes to get in touch with any Eastern manufacturers who desire to be represented in the Maritime Provinces. They are in a reliable, financial position, and will gladly furnish references to interested manufacturers.

579. Western Canada: A young man, well known throughout Winnipeg and Western Canada, and having an excellent connection in Winnipeg, would like to represent several Canadian manufacturers. His references are good.

FOREIGN.

580. Kingston, Jamaica: A commission agent in Kingston, Jamaica, is interested in extending business relations with Canada, and desires to make connections with manufacturers of the following goods: Dry goods, hardware, provisions, drugs, patent medicines, canned goods.

581. Melbourne, Australia: A manufacturers' agent in Melbourne is anxious to obtain Canadian lines on a commission basis for Australia, consisting of the following: Ladies' and children's stockings, ladies' silk gloves, men's gloves, cotton and woollen piece goods, metal frames for ladies' handbags and purses.

582. Europe: A British firm, anxious to extend its general import and export business, wishes to procure representation from Canadian export firms for the purpose of trading in the British Isles, Europe, Constantinople, and the Black Sea ports.

583. Boots and Shoes: A firm of commission agents, with head office at Trinidad and newly established branch at Barbados, wish to secure the representation of a Canadian firm for boots and shoes. Firm cover the entire West Indies and British Guiana.

584. Manufactured Rubber Goods: A firm of commission agents in Trinidad, with good references, wish to secure a Canadian agency for manufactured rubber goods of all kinds.

585. Agency: A firm of manufacturers' agents in Toronto, who also operate an office and have a sales force in England, wish to represent Canadian manufacturers in the United Kingdom. This firm has the best of references.

586. Flour Agency: A commission merchant and manufacturers' representative in Kingston, Jamaica, who is at present representing some large Canadian and American firms, is desirous of securing a Canadian flour agency in that colony. Good references can be given.

587. Canned Salmon: A commission merchant and manufacturers' representative in Barbados would like to get in touch with Canadian suppliers of canned salmon, either at Halifax, St. John or Montreal.

588. Iron Ore: An old-established firm in Middlesbrough, England, desire to import considerable quantities of iron ore to the River Tees.

589. Wood-Working and Metal-Working Machinery and Small Tools: A Dutch firm are interested in wood-working and metal-working machinery and small tools.

590. Agricultural Machinery and Implements: A Johannesburg firm make agency and purchasing arrangement inquiry in reference to the above lines.

591. Foundry Requisites: A Johannesburg firm make inquiry for correspondence and other data from manufacturers of foundry requisites.

592. Iron and Steel Goods: A Port Elizabeth, Cape Province, firm of importers request offers, catalogues and price lists from manufacturers exporting bar iron, galvanized iron, fencing wire, wire nails, general hardware and steel goods of all kinds.

593. Building Material: A Natal firm specializing in building materials and builders' hardware, request correspondence, price lists and catalogues, when possible, from Canadian exporters.

594. Engineers' Tools: A Durban importer of the above line asks for catalogues and correspondence from Canadian manufacturers.

595. Wire: A Durban manufacturer, with branch factory at Johannesburg, is open to buy Canadian wire, all grades, including copper, brass, nickel, steel, plain, galvanized and tinned wire.

596. Household Appliances: An importing firm in Pretoria, South Africa, specializing in labor-saving appliances, request correspondence, catalogues and prices from Canadian exporters.

597. Hardware and Enamelware: A Natal firm of wholesale jobbers will be glad to receive catalogues from Canadian manufacturers prepared for regular export on all lines of hardware and enamelware.

598. Hardware Tools: A firm of hardware dealers in Demerara, British Guiana, wish to stock a full line of hand-tools, such as axes, hammers, etc., and would be glad to get in touch with Canadian manufacturers of same.

599. Enamelled Ware: A Pretoria firm ask for catalogues and price lists from Canadian manufacturers exporting hand and hollow-ware.

600. Enamelware: A Johannesburg firm of importers request catalogues and price lists for enamelware of all kinds.

601. Enamelware: A large firm of hardware merchants in British Guiana would like to stock Canadian enamelware.

Canned Goods: Agricultural Implements: A firm in London, England, who are buying and shipping considerable quantities of goods there and in New York for West Africa and East Africa, where they have their own organization, wish to point out that there is an excellent market in the Kenya Colony for Canadian goods, such as tinned provisions, fish, fruit, etc., agricultural implements and other lines.
608. Novelties and Fancy Goods: A Kimberley, Cape Province, firm of importers ask for catalogues, prices, etc., from manufacturers of novelties and fancy goods.
609. Toys and Fancy Goods: A Durban firm request catalogues, price lists, etc., of Canadian-made toys and fancy goods.

An Iceland Fair

Farthest North World's Fair to be Opened at Reykjavik, Iceland, Next June

The Department of Trade and Commerce has been advised that the farthest north world's fair ever held will be opened at Reykjavik, the capital of Iceland, in June next. The Government of Iceland has communicated with the department, and is anxious that Canada should be represented at the fair by practically all classes of exhibits, but more particularly agricultural implements and goods required in connection with agriculture.

Iceland has a population of approximately one hundred thousand people, two-thirds of whom are farmers. There are many thousands of Icelanders in the prairie provinces, mo particularly in Manitoba, and it is expected that a conside able number will visit their former island home during th fair. Efforts will be made to establish at least a temporar direct steamship service between Montreal and Iceland in th spring, but exhibits shipped by way of Leith, Scotland, wi reach Iceland with but little delay as there is fortnightl service between Leith and Reykjavik.

Fire Losses

Losses by Fire in Canada During October Estimated a Over Two Millions

Fire losses in Canada in October, as estimated by the *Monetary Times*, were as follows:

Fires exceeding $10,000	$1,856,000
Small fires reported	111,901
Estimate of unreported fires	500,000
	$2,467,901

Several conflagrations took place during the month. The plant of the Canadian Cereal Mills in Tillsonburg was the heaviest loss, while fires in Wadena, Sask., St. Stanislas, Que., Brandon, Man., Stewiacke, N.S., and Port Arthur, Ont., caused losses of $100,000 or over.

The Governor of the Hudson's Bay Company announces the establishment, in connection with the University of Manitoba, of a fellowship for scientific research, for which the sum of one thousand five hundred dollars, beginning this year, will be allocated for ten years. The chief purpose of the award is the stimulation of research in all branches of science, pure and applied.

CHATEAU FRONTENAC · QUEBEC

QUEBEC is the same, Winter or Summer. There are the same formidable walls with their reminders of bygone days. There are the same frowning cannons, that in the past have belched forth fire and destruction. There are the same picturesque streets and quaint houses, with their pointed gables, steep roofs and off-looking windows. There are the same monuments, the same historical tablets with their reminiscent inscriptions, and there is always present the undeniable impression that nowhere on the whole continent of North America is there a city that so calls up a picture of mediaeval Europe as Old Quebec.

Quebec offers from Christmas to early March, a delightful winter holiday, with a lively programme of winter sports—tobogganing, Swiss bob-sleighing, snowshoeing, ski-ing, curling and skating.

The Chateau Frontenac, the magnificent Canadian Pacific Hotel, on Dufferin Terrace, is the cheery, hospitable centre of a gay, social life. Good orchestra and dancing.

For Information, Reservations, Etc., apply to
Manager, Chateau Frontenac, Quebec,

Railroad Earnings

All Principal Canadian Lines Have Increased Earnings for October, 1920

All Canadian transcontinental railways show increases in their earnings for the month of October as compared with the corresponding period last year. The earnings of the principal lines were—

	October, 1920.	October, 1919.	Increase.
Canadian Pacific	$24,607,000	$19,113,000	$5,494,000
Canadian National	12,351,167	9,542,328	2,808,839
Grand Trunk	11,666,798	9,540,544	2,126,254
Total	$48,624,965	$38,195,872	$10,429,093

Building Conditions

Shrinkage reported in the value of contracts awarded during October

Construction contracts awarded in all the cities, towns, villages and rural districts throughout Canada during October, according to figures compiled by MacLean Daily Reports, Limited, totalled $18,169,500, compared with $20,820,100 in September, and $25,579,300 in October, 1919. The total for the ten months of 1920 is $231,459,800, compared with $164,176,700 during the corresponding period of 1919, and $91,425,500 during 1918, being an increase of 40 per cent. over 1919, and 164 per cent. over 1918. While there has been a fairly steady decline during the past seven months in the amount of projects undertaken, the shrinkage is smaller proportionately than in the United States and a high volume of activity still prevails.

Contracts for 981 homes, valued at $4,362,500, were awarded during October compared with 835 costing $4,032,900 in September. The average cost of these residences was

The Canadian Pioneer at Calcutta

Canada's National Merchant Marine

CANADA'S forty-two ships sailing the seven seas and carrying Canadian products to every quarter of the globe is the marine end of Canada's National transportation system with its 14,000 miles of railway and 56,000 miles of telegraph lines.

The ships of the Canadian Government Merchant Marine make regular sailings from Canadian Atlantic and Pacific ports to the United Kingdom and the Continent, West Indies, Cuba, South America, New Zealand, Australia, Straits Settlements, Java and India.

These ships provide Canadian exporters and importers with a regular and reliable freight service connecting with any port in the world.

Information from any Canadian National or Grand Trunk Railway officer or agent.

CANADIAN NATIONAL RAILWAYS

$4,900 each, compared with an average cost of $4,629 in June of this year. For the ten months of 1920, $50,230,800 has been invested in residences throughout Canada compared with $47,013,100 for the full twelve months in 1919 and but $14,661,800 in 1918. The country is fully four years behind in its residential building programme.

Trade Returns

October figures show increases of good size both in imports and exports

Both imports and exports were on a larger scale during October, 1920, than for the corresponding month of 1919. Imports under the free list were about the same, but dutiable imports showed an increase of nearly $14,000,000. The principle products affected were iron and steel and manufactures thereof and non-metallic minerals and products. Exports, which experienced a decline in September, had a good recovery in October and were greater by about eighteen million dollars. The big gain was in agricultural and vegetable products, though there was also a substantial increase in wood, wood products, paper and manufactures thereof. Following are the statistics of trade for October:

Imports Entered for Home Consumption.

	1919. Free.	1919. Dutiable.	1920. Free.	1920. Dutiable.
Agricultural and vegetable products, mainly foods	$2,652,081	$11,772,437	$1,878,010	$7,452,321
Agricultural and vegetable products, other than foods.	4,019,984	2,055,109	2,885,168	3,226,809
Animals and animal products	4,165,666	3,357,839	1,957,191	3,088,357
Fibres, textiles and textile products	5,066,717	12,584,189	4,383,150	13,850,814
Chemicals and chemical products	1,119,093	1,832,294	1,601,198	2,026,838
Iron and steel and manufactures thereof	2,717,472	13,124,882	3,981,764	18,779,418

Reports from British Columbia state that the total applications for loan assistance made to the Advisory Board of the Provincial Industrial Department in one week amounted to $900,000. Although some of the applications were not commercially sound, a good percentage appeared promising and were approved by the Board.

ELDER DEMPSTER LINES

Canada-South Africa Direct Service

Regular monthly sailings from Montreal in Summer and St. John, N.B., in Winter, calling at Cape Town, Algoa Bay (Port Elizabeth), East London, Port Natal (Durban) and Delagoa Bay in the order named.

Canada-West Africa Direct Service

From Montreal in Summer, and from St. John, N.B., in Winter, monthly sailings for Dakar, Sierra Leone, Seccondee, Accra and Lagos, and other ports on the coast, if sufficient inducement offers.

Crane, Limited, Believes in Bonded Roofs

THE factory of Crane, Limited, recently erected in Montreal, is an interesting and imposing addition to Canada's manufacturing enterprises.

Several new construction features have been embodied in the plant for the purpose of securing greater economy and efficiency in factory operations. One is the use of creosoted wood-block flooring throughout; another, the location of the foundries on the top floor so that gravity could be utilized in conveying materials through the various steps of manufacture.

But when it came to the roof, there was no reason to depart from established practice. A Barrett Specification Bonded Roof was selected because the experience of thousands of owners has conclusively proved that no other roof is so satisfactory and, in the long run, so economical.

Our Guarantee is a Surety Bond

Barrett Specification Roofs are the *only* roofs guaranteed against repair and maintenance expense by a Surety Company Bond.

This bond, which runs for 20 or 10 years, depending upon the type of roof constructed, may be obtained without cost by the owner of any Barrett Specification Roof of 50 squares or larger, in towns of 25,000 or more, *and in many smaller places where our inspection service is available.*

Our only conditions are that The Barrett Specification, *revised April 15, 1920,* shall be strictly followed and that the roofing contractor shall be approved by us and the work subject to our inspection.

Important Notice

The Barrett Specification Type "AA" 20-Year Bonded Roof represents the most permanent roof covering it is possible to construct, and while we bond it for 20 years only, we can name many roofs of this type that have been in service over forty years and are still in good condition.

Where the character of the building does not justify a roof of such extreme durability, we recommend The Barrett Specification Type "A" Roof, bonded for 10 years. Both roofs are built of the same high-grade materials, the only difference being in the quantity used.

Full details regarding these Bonded Roofs and copies of The Barrett Specification sent free on request.

Editorial Comment

Visit the West Indies

AMONG the reports received during the past month from Canadian manufacturers was one which stated that the writer had never done anything in the way of export trade in the past, but that he intended this winter to visit the West Indies with a view to opening up business there. He referred to the new trade agreement between Canada and the British West Indies as the reason for his trip and expressed confidence in the outcome.

We bespeak the interest of all Canadian manufacturers of commodities saleable in the West Indies in what this man proposes to do. A new era is dawning in the trade relations of the Dominion and the British islands of the West Indies. The two parts of the Empire are being drawn closer together. It is surely desirable that advantage should be taken of the new arrangements, and one of the best ways to do this is to establish personal intercourse. A trip to the West Indies this winter would be a pleasurable break in business routine in any case, and we hope to see a good many manufacturers sailing south during the next few months.

Canada's Splendid Crops

AMONG the various factors advanced as giving cause for optimism, none carries more weight than the success of Canada's agriculture during the last year. Time and again, as the pessimist stresses unfavorable features, the optimist hits back with the assertion that there can be no reason to fear the outcome when the country has been blessed with such splendid crops.

For a time the optimist merely spoke in generalities. It was common knowledge that the earth proved very fruitful in 1920. Now, as a result of the efforts of the Dominion Bureau of Statistics, concrete facts are available to back up his general observations. Despite a drop in the price of wheat, so much larger have been the crops that the gross value exceeds quite considerably the total of previous years.

For the whole of Canada the total value of the field crops of 1920 amounted to $1,636,664,900—a goodly sum. The 1919 total was $1,452,437,500, and that for 1918 was $1,372,935,970. In the gross amount there is included a value of $536,730,000 for wheat, the unit price for which is placed at $1.83 per bushel. In 1919, with a price of $1.89 per bushel, the value of the wheat crop was only $364,857,000. This is a splendid gain, and in itself should be sufficient to inspire confidence.

Business men of Canada would do well to memorize these significant figures and, whenever they encounter arguments of a depressing nature, they should bring them out and employ them as weapons of defence and offence.

Blaming the Newspaper Press

MORE than one correspondent of INDUSTRIAL CANADA during the past month has expressed the opinion that the newspapers have had a good deal to do with recent trade stagnation. It is alleged by these correspondents that the newspapers have been campaigning for price reductions and by predicting lower prices and otherwise disturbing the minds of the public, have created a psychological condition that is inimical to the best interests of business. As one manufacturer puts it:

"They have unquestionably educated the buying public to expect values which were, and very largely still are, impossible. If many legitimate businesses are to be saved from bankruptcy, just as earnest a campaign should be instituted immediately educating the public as to the actual position so far as the retail trade particularly is concerned. This, after all, is the only element in business with which the consumer comes directly in contact. By this means confidence possibly would be restored to a degree sufficient to permit the readjustment of commodity prices to go on gradually, sanely and safely without working undue

hardship on anyone, whether manufacturer, wholesaler, retailer or consumer, and without the present serious prospect of unemployment."

There is a great element of truth in this argument. The public are undoubtedly influenced by what they read in the newspapers about deflation and, expecting greatly reduced prices, follow the natural impulse and refrain from buying. The disastrous results of such a policy, both now, in creating a condition of unemployment, and later on, in still further delaying readjustments, are too apparent to need elucidation. It is to be hoped that the press will from now on use its great influence to correct the misapprehension that is abroad.

The Unhappiness of Idleness

"EVEN if we could live for months walking the streets and drawing strike pay, the monotony is worse than hard work." So said, and truthfully, one of the striking railwaymen at the Scotia plant at Sydney Mines. It is not a new saying by any means, but it needs experience to bring it home vitally to the minds, not only of manual workers, but of all classes in the community. Work is the natural state of man and, despite occasional sprees of one sort or another, we must all get down to a basis of labor or pay the penalty in unhappiness.

This aspect of the economic situation is what fills the mind of the philosopher with reassuring thoughts. There may be all sorts of talk about social revolutions, all manner of threats levelled at those in authority, but mankind is not going to get away from the necessity of work nor the ultimate realization that in work there exists the great solace for discontent and unhappiness. The great masses of the people must continue under any system to labor on farm or in factory, in warehouse or in office, and it is in this knowledge and certainty that the world can move ahead with a fair degree of confidence in the stability of conditions.

Obstacles to Export Trade

IMPATIENCE is sometimes expressed at the supposed indifference of Canadian manufacturers to the claims of the export field. Time and again they have been accused of neglecting opportunities to get into foreign markets while lazily contenting themselves with home demand. While there may be some justification for this criticism in some cases, there are certain other considerations which should not be overlooked. Take, for instance, the experience of a stove manufacturer, who has been trying during the past year to build up a trade in electric ranges with Norway.

"The freight rates were very excessive on the first sample we sent to Stavanger," he writes, "but the service was fairly good. On the second order for forty-three ranges, it was impossible to get a boat at Montreal and the stoves were routed via New York. They left our factory on June 5th, reached Black Rock o August 7th, and finally arrived in New York in Sep tember. Although the whole shipment only weighe 8,000 pounds, the cartage in New York from railwa terminals to the steamboat wharf was $90.00. Ar not sure yet whether the goods have arrived in Norway The result of service like this is that we do not antici pate any further business with that country, and w certainly will never ship again via New York."

That is the other side of the shield. Can one won der that, riled by experiences like this, the Canadia manufacturer turns disgustedly away from expor business and concentrates on the home market?

There is obviously a duty here for our own Cana dian transportation companies to perform. The should co-operate with the manufacturers to give th most efficient service so that such heart-breaking de lays and difficulties may be avoided. Only in that wa can we hope to build up a permanent and satisfactor export trade.

Taxing the Interests

TAKING as its text the assertion of Hon, T. A Crerar that no government was ever so hope lessly entangled with the Big Interests as the presen government at Ottawa, the *Moose Jaw News* recentl published some remarkable figures to show ho severely so-called Big Business was being taxed in thi country. From every man making a profit of $100,00 the government takes $32,749, or nearly thirty-thre per cent. If he makes $200,000, the government tak $97,849, or over forty-five per cent. If he makes $50 000, the government takes $318,349. If he mak $1,000,000, it takes $696,349. Canada taxes higher i comes—Big Business—more heavily than any oth nation in the world.

More than this, under the Business Profits Ta Canada took a heavier toll from the profits of B Business than did similar taxation in any other nati which participated in the war; in fact, so severe w the taxation that it dammed the flow of capital in the country to such an extent that it had to be mo fied. Notwithstanding this modification, the tax tak twenty per cent. of all profit in excess of ten per ce and not exceeding fifteen per cent.; thirty per cent. all profits above fifteen per cent. and under twen per cent.; fifty per cent of all profits between twen and thirty per cent., and sixty per cent. of all prof thereafter.

During the war the government imposed a tax fifty per cent. of all profits of packers between sev per cent. and 15 per cent. and took all profits ov fifteen per cent. In addition, the packers had to p the ordinary business profits tax, the net result bei that the maximum profit they could keep was less th ten per cent.

"It is all very well for those who do not have pay so much in taxation to be constantly crying

increased taxation of others," said the *News;* "they, somehow or other, manage to escape. Take, for instance, the 'vital interest' of agriculture. As we pointed out recently, with an average of field crops in 1918 of $1,372,935,970, the agricultural interests only paid in the way of income tax $407,970, or 2.2 per cent. of the total income tax revenue. In face of this it is hard to see how Mr. Crerar or any of his friends can accuse the government of toadying to the Big Interests and relieving them of their duties. The *News* has no sympathy with profiteers or those who try to exploit the consumers of the country, and it is evident that neither has the government, or they would never be taxed at the heavy rate they are. Very likely some of them do escape paying their proper share, but even if they do they are not alone in that respect, as the figures of the income tax returns from the agricultural interests show. Whenever this comes to our notice it reminds us of the ghost scene from 'Ruddigore,' where the following dialogue takes place: Robin: 'On Tuesday I made a false income tax return.' All: 'Ha, ha!' 1st Ghost: 'That's nothing.' 2nd Ghost: 'Nothing at all.' 3rd Ghost: 'Everybody does that.' 4th Ghost: 'It's expected of you.'"

Advises Manufacturing on Stock

A MACHINERY manufacturer makes the point, in a letter to INDUSTRIAL CANADA, that he thinks manufacturers in general would be well advised, instead of closing down their plants until sufficient orders develop to warrant re-opening, to keep operating on stock. He is adopting this policy himself in the confident belief that by early spring the present slackness will be over.

"Nearly all our manufacturers," he says, "have been able in the last year or year and a half to sell nearly all they could manufacture at a margin of profit. While they will not wish to lose what they have made, still we do not think they should close their plants as they are doing in a large number of cases to-day, slaughtering their goods, when it is a well-known fact that the prices of the majority of the goods which are manufactured in Canada will only drop say from ten to twenty per cent. in the next few months, and it will be a surprise to us if articles in general average a drop in price of even that amount."

The writer, in support of his viewpoint, declares that Canadian banks are ready to back up the manufacturers. He points out that, whereas in the United States banks do not as a rule carry manufacturers when business is dull up to the extent that they would before the slump occurred, in Canada, if it can be shown that a manufacturer's condition is strong, the banks will wait a certain length of time for their money. This has a soothing effect on industry and, if the manufacturing concern which is dealing with the bank is not plunging, the bank will support him.

The Outlook for 1921

A SHARP contrast presents itself between the attitude of manufacturers at the year-end of 1919 and that at the end of 1920. Twelve months ago there was no apparent end in sight to the period of feverish activity and high prices then prevailing. All reports received indicated operation at full capacity, with a plenitude of orders both for home and export markets. Labor was none too plentiful, wages were still tending upward, efficiency was far below the average, and raw materials were apparently in short supply and highly priced. It was from every point of view a buyer's market, and manufacturers referred confidently to the continuance of that market throughout the year.

To-day there has come about an almost complete reversal of the situation at the end of 1919. We have passed into a period of liquidation. The active production so evident throughout the entire industrial fabric a year ago has dropped off; operations have been curtailed and there is unemployment. Wages are still ruling generally at the high level attained during the early part of the year. Raw materials are no longer difficult to obtain, and in many instances they are quoted away below the prices in effect at the beginning of the year.

These are the facts of the situation and they must be faced. No amount of optimism on the one hand or of pessimism on the other can alter their significance. It remains but to seek their cause and to point out a few considerations which may give a more hopeful aspect to the outlook.

The change which has occurred during 1920 has been an inevitable result of the inauguration of the process of deflation. Just as in the stock market, buying is done on a rising market and selling on a falling market, so in the case of commodities. As long as prices were moving upward there was an irresistible tendency to buy, and this worked right through from the ultimate consumer to the manufacturer. When the pyramid had reached a certain height and the speculators in raw materials began to feel the turn was about due, a selling movement began, slow at first but steadily gathering momentum. Prices receded right along the line. And then, the reverse of what might naturally have been expected, occurred. Lower prices, instead of inducing buying, caused an almost complete cessation of buying. Precisely as in the stock market, the public refused to buy on a falling market. And they will continue to stay out of the market until prices once more harden.

There are solid reasons, however, why the present dislocation of trade should not be of long duration. Just as in the unsettled period following the outbreak of war, when the bottom seemed to be falling out of everything, and again in the period after the armistice, when it was generally expected that prices would break, the trend of events was directly opposite to

expectations, so now, when talk of trade depression is so rife, there is every ground for expecting that the worst will soon be over.

There is a decided shortage of goods in the hands of the retailers, a condition which cannot be prolonged. There is a growing feeling among the public that the policy of "no buying" is short-sighted and injurious to the general interest. There is the effect to be expected from the expenditure of large sums of money in public works. There is the well-founded belief that 1921 will see a large flow of immigration with all that that means. There is the settling down of business to a more normal condition, which after all is one of the most satisfactory developments that could occur. There is the greater efficiency which times like these induce and which has an important bearing on production and costs of production. All these conditions are favorable and will work towards an improvement in the situation.

Transportation, not Protection, to Blame

DESCRIBING the kind of evidence submitted to the Tariff Commission at Charlottetown by the provincial government as "small, irrelevant and meaningless political claptrap," which did "an almost irreparable injury to the province," the Charlottetown *Guardian* extolled a letter that was sent to the Commission after the sitting by Mr. J. O. Hyndman, which it declared contained the kind of information that Sir Henry Drayton was looking for.

Mr. Hyndman is head of a firm doing all kinds of insurance. He also owns and manages a large farm, is interested in fur farming, fishing and other industries, is past-president of the Charlottetown Board of Trade, is secretary of the P.E.I. Division of the Navy League of Canada, is chairman of the Soldiers' Settlement Board in Prince Edward Island and holds various other positions, "which has given him an opportunity of getting a fair insight into local trade conditions."

The purport of most of the evidence submitted to the Commission at Charlottetown was that the Island farmers were not making money and that this was due in large measure to the burden of the protective tariff. This was particularly the attitude taken by Hon. Walter M. Lea, Commissioner of Agriculture, and by J. A. Dewar, M.L.A., president of the United Farmers of Prince Edward Island.

What was Mr. Hyndman's position? Simply that Prince Edward Island's troubles were practically entirely due to inadequate transportation facilities. He contended vigorously that the Dominion Government had not lived up to its bond in giving the Island promised means of year-round communication.

"Owing to lack of proper railway transportation in years past," said he, "our people, being unable to develop inter-provincial trade, were induced to trade largely with the Americans, and shipped a great deal of their surplus products to the American market b steamers and sailing vessels, and through this trad a great many of our young people were attracted i that direction, and those left at home were induce to clamor for free trade."

At another point in his letter, Mr. Hyndman says "This agricultural province has reached its presen prosperous position under very severe handicaps, an our people are now awakening to the immense poss bilities in store for the future when efficient tran portation is secured. There is no reason in the worl why this province should not have double our preser population and, if the Dominion Government woul see its way to give us our rights in transportation, w would then have the opportunity of developing manu factures suitable to the country."

"As a business man and one engaged considerabl in agriculture," declared Mr. Hyndman, "I am quit satisfied that the citizens of this province do not de sire free trade, as it would be disastrous to their in dustry, nor are those who have given thought or stud to the question in favor of lowering the tariff indi criminately, and thus boosting the manufacturing in terests of the United States and other foreign cou tries. It seems to be pretty good evidence in itself tha our people are well satisfied with the present tariff co ditions, when so little interest was manifested durin the sitting of the Tariff Commission in Charlott town. . . . If we had no manufacturing in Ca ada, but depended on the factories of the United Stat and other countries for our manufactured goods, t result would be tremendous emigration from Cana to those countries. We have had sufficient experien of what that means in Prince Edward Island owi to lack of transportation. We have as a consequen been unable to promote and develop manufacturi with the result that a great many of our best peo have joined industrial life in the large mercant centres, much to the detriment of our province."

Freedom of Employment Urged

SPEAKING at the last quarterly meeting of t Glasgow Chamber of Commerce, the Rt. Hon. Lo Weir of Eastwood, head of the great Scottish engine ing firm of G. E. J. Weir, had some forceful things say about the present industrial situation in Gre Britain. The gist of his remarks was that industr salvation could only be achieved through the breaki down of those restrictive barriers to employment a more efficient production which are so tenaciously h held by trades union leaders. He believed that th policy in this regard was short-sighted and not in e best interests of the trades union members the selves, and that the extension of freedom of empl ment and the adoption of the system of payment y results would work out to the advantage of all clas of workers.

Lord Weir's argument rested on the follow g

assertions: the effect of limiting the number of producers is to increase prices; the result of increasing prices is to curtail consumption, and the effect of the curtailment of consumption is to increase unemployment. This chain of cause and effect has been working out in Canada as well as in Great Britain. We have unemployment to-day, due to lack of buying, induced, it is true, by anticipation of reduced prices, but actually caused in the last resort by high prices created by under-production.

"The plea that higher productivity results in earlier unemployment," asserts Lord Weir, "has been frequently stated and as frequently countered. If markets were limited and non-expansible, there might be some basis for suggesting at least a temporary cessation of employment, but there are few markets for manufactured articles which are not capable of great expansion, especially by a reduction in price, which taps lower strata of buyers. Every reduction on a normal price induces an increasing number of buyers, broadens the basis of demand, and requires the services of more workers."

Lord Weir paints a rather gloomy picture of conditions. He maintains that the maintenance of to-day's standard of living is impossible under to-day's conditions of volume and efficiency of production and that no improvement in the standard of living is possible until productivity is not only enormously increased but is much more efficiently secured. He corrects the fallacy that it is merely an increase in gross production that is wanted. What is really required is increased production obtained by a greater efficiency. Merely to obtain greater production, he points out, will help very little. The demand factor is to a great extent dependent on efficiency or cost of production. In the poor industrial performance of the country lay the chief factor affecting the cost of living, and this, in his opinion, could only be righted by increasing intensity of effort, increasing for a time the number of operative hours per individual per day, increasing the number of operative individuals and perfecting methods, processes and organizations so as to eliminate waste of operative hours.

Dealing with freedom of employment, Lord Weir recalled the lesson of the war, when it was found that, when demand for a product was temporarily unlimited, the rate at which the product could be supplied was definitely dependent on the extent to which the restricted nucleus of skilled labor could be increased by unskilled labor. The nation was forced by war's emergency never to use a skilled operative if an unskilled one could do the work. This lesson was now forgotten. He instanced the urgent need for houses, pointing out that men available to build them were walking about unemployed because employment was not free. Relief work for the unemployed was being started, when new houses were urgently required.

"If this freedom (of employment) can be made effective," declared Lord Weir, "then I confidently predict a wave of enterprise and development in the industrial world which will go far to remove the threat of unemployment and will carry with it a permanent improvement in the lot of the working population."

Progress of Cotton Textile Industry

UNDER the new system by which the Dominion Bureau of Statistics compiles and issues annual reports on each of the principal manufacturing industries of Canada, it is possible to obtain a fairly accurate gauge of the progress of each industry from year to year. Figures for 1919 on the cotton textile industry were recently published, and these, taken in contrast with the 1918 figures, afford a means of estimating whether the industry is advancing or receding.

From the standpoint of plant and equipment the change was but slight. The number of plants increased from twenty-six to twenty-seven, but the amount of capital invested in land, buildings and fixtures was reported to be down from $14,305,235 to $14,016,973, doubtless due to the writing off of certain amounts for depreciation. On the other hand, there was an increase in the value of machinery and tools from $19,319,148 to $21,200,219, which is shown in a reported increase in the number of looms from 21,161 to 21,548.

There was a very slight increase in the number of employees, what was particularly noticeable being that the number of male employees increased by 440, whereas the number of female employees decreased by 320. This was obviously a post-war adjustment. The total of employees for 1919 was 16,124, while for 1918 it was but 16,004. On the other hand, salaries and wages advanced from $9,227,343 to $10,981,097, which indicated a fair increase in the average wage paid in the industry.

The cost of the materials entering into the production of cotton showed an increase from $34,289,862 to $43,816,517, which was confined very largely to the cost of raw cotton. It is significant, however, that the quantity of raw cotton used only increased from 85,233,016 pounds to 85,903,961 pounds.

Turning to output, while values jumped from $66,399,288 to $82,642,949, quantities showed no corresponding increase. Of grey yarn there was produced 15,935,701 pounds in 1919, as compared with 17,164,627 pounds in 1918. On the other hand, output of bleached and dyed yarn increased from 2,363,583 pounds to 3,211,992 pounds. Production of unbleached grey cotton amounted to 122,286,314 square yards in 1918 and to only 110,161,384 square yards in 1919. Bleached cottons were produced to the extent of 32,485,635 square yards in 1918 and to 62,908,633 square yards in 1919. Printed, dyed or colored fabrics stood at 69,190,500 square yards in 1918 and at 52,917,429 square yards in 1919. On the whole, therefore, production was lower, though values were considerably higher.

New Year Messages from Association Officer

Previous Experience Gives Ground for Optimism

By J. S. McKINNON

President, Canadian Manufacturers Association

AS a mental stimulant, during the present trade depression, Canadians should recall our previous periods of difficulty which were usually dignified by the name "crisis."

As a matter of fact, the history of Canada is composed largely of a succession of such crises. From the time the first adventurers landed amongst the primeval forests of this country, our history has been a continuous struggle against natural and artificial conditions that have threatened the development of the nation. Space will not permit me to dwell on many such periods, but I would like to recall at this season a few of the more recent.

In 1914, when war broke out, fears were expressed that Canada would suffer from the ensuing trade disturbances. We had a short period of hard times in the fall of 1914, and in the early part of 1915, but Canada reorganized her productive machinery and was soon shipping hundreds of millions of dollars' worth of agricultural products, manufactured goods, munitions of war, not only to Europe, but to many other countries outside of Europe. When the Armistice came pessimists said that our export trade, which had sprung up so rapidly, would disappear, and with it our prosperity; and that Canada would have such immediate hard times that it would be impossible to absorb the returning army and provide employment for those who had been engaged in war manufacturing. All these doubts and fears were proved to have no foundation, and instead of depression after the Armistice, w had two years of prosperity and a shortage of labo

Now we are facing a new set of conditions. Politic struggles, labor troubles and exchange conditions a disturbing international trade. We have some u employment in Canada, due chiefly to the fact tha during the twelve months ending October, 19 Canada imported goods to the value of $1,339,627,5 or $439,609,216 more than we sold during the sa period; and also to the mental attitude of the pub who are refraining from purchasing.

We have been told by many foreign visitors th Canada is perhaps the most fortunately situated a the most happy and prosperous country in the wo to-day. We have great stores of raw materi Agriculture, on the whole, is in a strong position. O industrial and commercial organizations are efficie and adequate. The wealth and buying power of t country is great, as indicated by the bank deposits a bond holdings.

As we remember the crises through which Cana has successfully passed, and recall her resources, which the character of her people is probably the m important, and realize that the basic conditions in t country are sound, there are good grounds for beli ing that the country will pass through the pres period of depression without any serious danger to national welfare if we meet our difficulties with stea ness and courage.

Optimism from the Pacific Coast

By JAS. B. THOMSON

Chairman, British Columbia Division, C.M.A.

THE British Columbia Division of the Canadian Manufacturers Association feel that they would like to convey to members of the Association in other provinces, heartiest greetings for the festive season, and the assurance of our belief that if the proper energy and sentiment is displayed by all members of the Association during the year 1921, it will be a far more prosperous year for them than the year through which they have just passed.

The sentiment of the members of the Association, and of all manufacturers in British Columbia, might well be interpreted to be the same as the sentiment of the British Navy. A well-known public man, an ex-naval officer, in speaking to a gathering of business men in this province recently, made the statement that the British Naval Code contained no words to express what is meant by "pessimism," but that as regards "optimism" there were over fifty words which could be used to convey that spirit. British Columbia manufacturers are all optimists, and if any man joins the industrial life of this province with any pessimistic views, he either promptly becomes an optimist, or disappears from that sphere of our life.

As an indication that optimism in the future of British Columbia has reached as far as the Marit Provinces, it is gratifying to see the announcemen the press here, that the Chairman of our Marit Division, Mr. Angus McLean, proposes to establish immense pulp industry in the Fort George Dist of this province, and to note that such enterpris men in Canada as Sir Charles Gordon, one of own members, and Mr. Molson McPherson, a pro ent Eastern banker, are taking an active part in promotion of this enterprise. It is gratifying to see that the men behind this undertaking are Bri citizens, and to know that the profits accruing wil to Canadians rather than to citizens of other countr as has happened far too frequently in the past w it came to harvesting the profits from the develop of British Columbia resources.

Again wishing the Association every success, its members every prosperity during the coming y the British Columbia members would assure you they are not downhearted. With the immense mar of the Orient, and our natural freight waterway all parts of the world, we feel that the fringe of opp tunity existing in our midst as regards manufactu has only just been touched.

Reasons for Thankfulness and Optimism

By W. S. FISHER

Vice-President, Canadian Manufacturers Association

HEARTIEST good wishes to all our members for a happy and prosperous 1921. Have we Canadians good cause to look hopefully to the future? By all means! As the old year has passed and we are upon the threshold of the new, every Canadian can afford to look back with thankfulness and ahead with optimism.

Thankfulness that the country has passed through the after-math of the war so successfully; that the year just closed has given us bountiful crops and that on this side of the continent Peace prevails—all in marked contrast to the disturbed conditions, poverty and disaster so evident on the other side of the ocean.

Optimism because we have a country of rich and varied resources. A climate that develops a race of vigorous people who, looking back over the accomplishments and progress of the past, can look forward with that hopefulness and confidence born of experience to a future filled with great possibilities in which there is a part for every one to play—a work for every one to do.

Let us make up our minds to import less and produce more, so keeping our people at home and the money in the country, which will rapidly correct the adverse exchange and make a Canadian dollar equal to an American one.

There is no room for anything but hopefulness. The decline in inflated values in many lines that is going on will soon find its level—not the old level, but one that for some time will be looked upon as normal. This necessary readjustment will reduce the present high cost of living and bring in its train a new period of progress and prosperity.

With well-grounded faith in the great possibilities ahead of this country, let us face the future with serenity and confidence.

A Salutation from Quebec

By J. H. FORTIER

Vice-Chairman, Quebec Division, C.M.A.

SEASON'S GREETINGS to the members of the Canadian Manufacturers Association from Atlantic o Pacific from the Executive and Members of the Quebec Division.

In approaching the year 1921 we, in the Province f Quebec, do so without serious misgivings. We ealize as business men that big problems confront us uring the coming twelve months and we also realize hat these problems must be handled in a big way if ney are to be solved satisfactorily.

Quebec has two languages, but only one determinaon, and that determination is, to be Canadian and be astute business men, so that Canada may become very truth the brightest gem in the British diadem.

Quebec has been called "the balance-wheel of anada." We accept the compliment, and it shall be our earnest desire to live up to that high standard in which this has placed us. It is our determination in this Province where Champlain and Wolfe glorified the annals of their respective countries to live up to the tradition of the past and to so conduct ourselves as a people that in being "the balance-wheel of Canada" we may become a strong bulwark against all factions that may assail the peace and prosperity of this great Dominion.

We have a thrifty and contented people, and on the basis of thrift and content we take our stand.

In the year 1921, whatever may be our problems and however great may loom the obstacles which we have to overcome, Canada and Canadians may rely upon a sheet anchor in the Province of Quebec.

Gentlemen of the other Divisions, we salute you at the opening of the New Year.

Greetings from the Prairie Provinces

By DAVID J. DYSON

Chairman, Prairie Division, C.M.A.

ON behalf of the manufacturers in the Prairie Provinces, I wish to extend to other Canadian manufacturers heartiest Season's Greetings and best wishes for a prosperous New Year.

Manufacturers in the Prairie Provinces continue to do good business. A survey by the Employers' Association of Manitoba on Nov. 15th, 1920, showed 611 more employees engaged at that time than on the same day in 1919.

Almost $85,000,000 is invested in manufacturing industries in Winnipeg, and this year the output from its factories will be little short of $120,000,000.

The annual report of the Bank of Montreal states: "The Prairie Provinces produced this season the second largest crop in their history, surpassed only by the premier crop of 1915. The value of the 1920 crop far exceeds that of any previous crop."

The present purchasing power of the Prairie Provinces is determined largely by the crop value. Therefore, manufacturers in the Prairies, look forward with confidence to increased business for 1921. Apparently bankers are willing to supply manufacturers with whatever accommodation they may require to carry on.

While the Prairie Provinces have made industrial progress in recent years, the sound fiscal policy which has industrialized the East must be continued until the West has realized its possibilities. It is the only sound policy for the West to adopt.

The future agricultural population of the West will demand industrial employment. Then the West will make the finished products which it requires for itself. The West must manufacture more largely for itself to save the tribute now paid to industry elsewhere.

Synopsis of Proceedings Before the Tarif Commission in Quebec and Ontario

FOURTH SERIES OF REPORTS

Based on the Official Report

This constitutes the fourth series of reports which we have published of the hearings held by the Special Committee of the Dominion Cabinet appointed to receive representations with regard to the Canadian Customs Tariff. Owing to the great mass of material presented, particularly during the sessions at Montreal and Toronto, it has been impossible to do more than give a bare outline of the proceedings. Sufficient information is supplied, however, to give a fair general idea of what transpired.—THE EDITOR.

AFTER concluding their Maritime Province hearings at Moncton on November 10, the members of the Tariff Commission proceeded to Quebec and commenced lengthy hearings in the Provinces of Quebec and Ontario. This took them from Quebec to Sherbrooke, thence to Montreal, Hamilton, London, Windsor and back to Toronto. The story of the Inquiry is resumed at Quebec.

QUEBEC

Nov. 11.—The inquiry opened in the City Council Chamber at 10 a.m., Joseph Samson, mayor of Quebec and president of the Association of Manufacturers of Agricultural Implements of the Province of Quebec, was the first witness. He presented statistics showing the growth of manufacturing industry in Quebec City, which he attributed in no small degree to the effect of the protective tariff. He believed that any radical changes in the protective policy would compromise the security of the city's industrial establishments. In conclusion, he quoted Sir Lomer Gouin, who had stated that what was wanted in Quebec was a tariff that would keep industries going.

O. H. Coté, Industrial Commissioner of Quebec City, dealt with the establishment of branch plants in Canada by United States manufacturers, contending that the reason for their location was the protective tariff and arguing that this should not be removed. He also spoke in favor of developing all raw materials possible in Canada, referring particularly to asbestos.

Manufacturers' Brief

J. H. Fortier, vice-chairman Quebec Division, C.M.A., presented a brief on behalf of the manufacturers of the province. This furnished statistics showing the expansion of industry. It indicated the way in which farm land values had increased, as compared with land in the prairie provinces. It demonstrated that practically one-third of the people in the province were directly dependent upon manufacturing industry.

Dealing with the historical aspect of the situation, Mr. Fortier showed how Quebec suffered from depopulation until the inauguration of the National Policy of protection. This policy, to a greater extent perhaps than any other factor, was responsible for keeping the young men and women of Quebec within the province.

He referred to the rich endowment of the province in natural resources, affording wonderful opportunities for development. He spoke of the character of the people, the labor supply being perhaps the most stable and dependable of that in any part of the continent. Quebecers who had left the province were returning. Agricultural districts were becoming notably prosperous.

Special reference was made to the expansion in the Chicoutimi and Lake St. John District, where large industries were located and where farm values were high. Further, in view of the curtailment of foreign markets, it was important that the home market for agricultural products should be enlarged in every possible way. Stress was also laid on the adverse rate of exchange, which made home buying all the more necessary. The income tax was criticized as a substitute for customs revenue taxes.

Joseph Picard presented a statement on behalf of the manufacturers of Quebec City. He gave a list of goods made in the city and stated that the principal industries drew for the most part on local sources for their raw materials. They gave employment to people who might otherwise leave the country. He dealt with the opportunities afforded for further development and said that the manufacturers of Quebec were not afraid of competition on a basis of equality with manufacturers anywhere in the world. With the home market assured, they had opportunities to build up export trade. All that they asked was that the Government should protect them against a division of the home market, which would restrict output and r costs.

Mr. Picard further presented a st ment dealing with the tobacco indus He showed how it had grown under stimulus of protection and stated t by reason of the protection afforded Canadian tobacco grower, he had receiving approximately ten cents pound more for his product than grower in the Southern States got tobacco of similar quality. Mr. Pic asked that the present tariff on ma factured tobacco be continued with change, and added that he was q satisfied that the protection to the adian tobacco grower should not be than was afforded now. He sugge that the excise tax of 5 cents per po now levied on domestic leaf entering licensed tobacco manufacturing plant discontinued and that an excise ta imposed on raw leaf when sold for sumption, such tax to be equivalen the tax now paid by the licensed fact on the sale of manufactured tobacco.

J. Albert Forand, director-genera the Foundry de Plessisville, addre the Commission in French. He pressed himself as in favor of the erate protection at present accorde the industry, basing his opinion on necessity of supporting industry in to meet the national debt and for development of our natural resou He answered a number of questions regard to the extent and operation o own industry.

Industries of Plessisville

P. J. Magnan, Mayor of Plessis spoke for the industries of the vi and said that he believed the tari isting to-day must be kept on to pr them.

Herbert V. Gale, president of the bec Boot and Shoe Manufacturers ciation, appeared on behalf of that c ization and submitted facts and fi showing the great importance of boot and shoe industry to the ci Quebec and its environs. There we factories and they manufactured 2 cent. of all the leather footwear ma Canada. He contended that any tion in the present tariff would ser affect the industry and throw hands out of employment.

John Ritchie gave his views as the oldest boot and shoe manufac in Canada, having been in business 40 years. His experience had taugh that adequate protection was abso

necessary to enable the industry to produce cheaply and well.

Lucien H. Borne presented a statement on behalf of the tanners of the city of Quebec and district. He stated that the manufacture of leather and leather products was the foremost industry of the district and gave statistics showing the extent of the industry. Under a moderate protective tariff the tanning industry had developed by steady growth until it supplied practically all the requirements of the Canadian market except leathers made from hides not grown in Canada.

No Protection Now

Owing to the exchange situation there was practically no effective protection against imports of leather from the United Kingdom, and the net protection against imported leathers of U.S. manufacture was small. In so far as the tariff had enabled the Canadian tanner to supply the major part of the Canadian requirement of leather, it had increased the output and enabled production at the lowest possible cost. He instanced the case of a patent leather plant in Toronto which had developed into the largest in the British Empire. He also referred to the glazed kid leather industry, which had languished because of inadequate protection.

Paul Hebert presented a statement on behalf of the St. Lawrence Glove Works. After giving information about the company, he stated that a substantial tariff protection was needed to enable Canadian plants to sell sufficiently below the price of imported goods to overcome the prejudice in favor of imported gloves.

Supported the Tariff

Philippe Bechard, managing director of A. Belanger, Limited, Montmagny, manufacturers of stoves, plows, harrows and cultivators, enumerated nine reasons in favor of tariff maintenance.

Hon. N. Garneau, M.L.C., president of the Breeders' Association of the Province of Quebec, and a member of the Agricultural Council of the province, presented a statement on behalf of the farmers of Quebec. He referred to the intensified difficulty of the farmers' position resulting from the high prices of machinery, materials and merchandise, and claimed that this justified a general lowering of the tariff on all articles required for the cultivation of the soil and the support of the family. He further dealt with the high profits of Canadian industries, which enabled them to pay exaggerated salaries, tempting young men away from the farms.

Mr. Garneau stated that there was less cultivated land in Quebec this year and the herds of cattle in the Dominion had also decreased. He demanded the abolition of the tariff on a long list of articles and its reduction to not more than 10 per cent on other articles.

Gustave Boyer, M.P., president of the Dairymen's Association, and of the Maple Sugar Co-operative Society of Quebec, asked for the removal of the duties on tinware, evaporators, syrup tables and pails used in the maple sugar industry. The industry, he claimed, needed encouragement. Questioned by Sir Henry Drayton, he first declared that he did not want protection on maple syrup and sugar and then declared that he did.

Frank Byrne, president of the Breeders' Association of the district of Quebec, said he did not think the farmers had the big end of everything. They had to get up at four o'clock in the morning and work sixteen hours a day. He thought the tax on implements used by the farmers should be reduced.

Auguste Trudel, manager of the Central Agricultural Society, declared that he was a free trader and thought there should be free trade in Canada. He thought the protective tariff had helped to decrease rural population.

John Hay, M.P.P., spoke as a practical farmer and said he found it hard enough to get along. It was largely a case of getting help. Labor went to the cities instead of staying on the farm.

Georges Bouchard spoke in French and supported the general statement of the farmers.

Louis Lavallee and Joseph Gloutier objected to the manufacturers paying higher wages than the farmers and too high duties on agricultural implements.

Elizee Theriault, M.P.P., closed the farmers' case by repeating the complaint that the farmers were not able to make money.

SHERBROOKE

Nov. 12.—The Commission met in the Court House at 10 a.m. J. S. Tetreault, deputy mayor, welcomed the members to Sherbrooke and presented a statement on behalf of the city. Sherbrooke, he said, had had a greater growth during the last 20 years than perhaps any other city of similar size in the province. It was proud of its industries and was concerned for their future prosperity. He voiced what he considered was practically the unanimous sentiment of the people when he said that they would greatly regret any change in the fiscal policy of the Dominion which would place the industries at an unfair disadvantage.

Andrew Sangster presented a statement on behalf of the manufacturers located in Sherbrooke. It gave statistics showing how industry had expanded in the city; indicated the principal products manufactured; showed how United States branch industries had located there under tariff protection; and insisted that adequate tariff protection was vital to a healthy condition of manufacture.

R. J. Caldwell, Canadian Connecticut Cotton Mills, Limited, told of the location of their industry in Sherbrooke and gave information about its operations, declaring that tariff protection was an absolute necessity to its success.

F. S. Laight, Union Twist Drill Co., Rock Island, told of the extent of their industry and stated that they intended to enlarge their plant, provided they were assured of the local market.

A. D. Lown presented a statement on behalf of the Canadian Manhasset Co., St. Hyacinthe, which had expended to date $797,942 on a Canadian plant, claiming that had it not been for the protective tariff they would not have built in Canada.

Alfred Tourigny, secretary-treasurer of Magog, P.Q., told how the life of the town depended on the local industries.

Sherbrooke's Prosperity

J. W. McKee, president of the Sherbrooke Board of Trade, presented a couple of resolutions that had been passed at meetings held under the auspices of the Board. The first declared that, for specified reasons, a policy of adequate tariff protection was in the best interests of the city of Sherbrooke, the Province of Quebec and the Dominion of Canada. The second, passed by the Merchants' Committee of the Board, declared that the best interests of the city and country would be served by the greatest increase in the number and extent of manufacturing industries, and that this could be obtained by the making of reciprocal trade agreements with all foreign countries; in doing this reduction in tariff should be made gradually and in proportion to the reductions secured in such foreign markets. Further, the committee was of opinion that a decrease in the present tariff could not be made without seriously affecting the manufacturing interests of the country, and that this decrease be carried into effect in the coming revision of the tariff.

A. C. Skinner, jeweler; A. D. Echenberg, furniture and carpet dealer, and W. B. McCaw, furniture and carpet dealer, discussed the luxury tax.

A letter was handed to the chairman from the Lay Whip Co., Limited, Rock Island, asking that no change be made in the tariff on whips.

E. A. Lunderville, Cowansville, pump manufacturer, speaking for the manufacturers of Cowansville, said that it was their desire to have the tariff remain as it was, both on account of the industries already located in the town and on account of new industries in prospect.

The Farmers' Troubles

W. S. Armitage, farmer, said that the labor situation and the high price of farming machinery were the farmers' principal troubles. He answered a long series of questions regarding his purchases of farm machinery and the output of his farm.

J. R. Langis, as representing one of the largest retail merchants in the city, took exception to the resolution of the merchants' section of the Board of Trade, and stated that they wanted the tariff kept as it was.

A. C. Skinner, jeweler, referred to the importation of Ever Sharp pencils, on which he claimed the duty was too high.

He would not have a high tariff on goods not made in Canada.

H. M. Holbrook, Canadian Peerless Jewelry Co., said that they were handicapped by the tariff on their raw materials. They were very well satisfied with the present tariff and would feel very uneasy if they thought the Government had in mind any serious reduction.

VICTORIAVILLE

Nov. 12.—A delegation from Victoriaville, headed by the mayor, Dr. J. B. Drouin, J. E. Alain and A. H. Paradis, president of the Chamber of Commerce, appeared before the Commission on their private car en route to Three Rivers. Mr. Alain presented a memorandum on behalf of the furniture manufacturers of Victoriaville, Three Rivers, and surrounding district. This set forth the number of plants engaged in the manufacture of furniture, and described their operations, employment, etc. It concluded with the statement that the Canadian tariff had helped the manufacturers to build up efficient plants in this country, and asked that the present tariff be continued without change.

Dr. Drouin, the mayor, enumerated the industries of Victoriaville and said that they relied on adequate tariff protection to keep them in operation.

A. H. Paradis presented a resolution of the Chamber of Commerce passed at a special meeting held on November 9, in which the Chamber placed itself on record as favoring the continuance of an adequate tariff protection for the industries of Canada.

THREE RIVERS

Nov. 13.—The Commission met in the City Hall at 10.30 a.m. W. G. E. Aird, manager of the Wabasso Cotton Co., Limited, presented a statement giving a history of the company and explaining its operations. He stated that, in the opinion of the company, the industry could not be successfully carried on if any reduction was made in the present tariff.

Mr. Aird also presented a statement along similar lines for the Shawinigan Cotton Co., Limited.

C. H. Moigneau, secretary Three Rivers Board of Trade, presented statistics about the industries of the city, and said the Board viewed with alarm any suggestions tending towards a reduction of the protection now enjoyed by the textile industry.

J. M. Garceau, farmer, running a dairy farm, said that the farmers' financial position was very much better now than it was ten years ago. Farm values had gone up because there was more chances of better prices for farm products with the increase in the local market.

Eugene Tremblay, an employee of the Wabasso Cotton Co., presented a statement in French and English, which was read by Mr. Pringle. It recited that he was well satisfied with the wages he received and with the treatment accorded him by the company. Living conditions were good. Many employees owned their own houses. Speaking for himself and on behalf of other operators in the mill, he would respectfully call the attention of the Commission to the hardships which would be visited on them if the industry, on account of reductions in the tariff or for other reasons, were forced to discontinue operations. The statement was endorsed by 13 fellow-workers.

J. E. Bellefleur, superintendent of the Wabasso Cotton Co., answered questions with regard to wages and employment.

C. R. Whitehead, president Wabasso Cotton Co., said that they had been instrumental in getting the age limit raised from 12 to 14 years, and would like to see it raised to 16. He also stated that the company was the first on the continent to reduce the working week to 55 hours.

MONTREAL

Nov. 15.—The Commission opened its hearing in the Council Chamber, City Hall, at 10 a.m. Mayor Mederic Martin welcomed the Commissioners and stated that the tariff was necessary to stabilize industrial and commercial conditions.

Mr. Monette appeared on behalf of the Association of Market Gardeners of the Province of Quebec, of which he is President. He advanced a series of reasons why there should be a moderate tariff on farm products and presented a resolution passed by the Association to that effect.

F. W. Stewart, chairman Montreal Branch, C.M.A., presented a brief on behalf of the manufacturers of Montreal, in which statistics were given showing the industrial growth of the city, under the encouragement of a moderate protective tariff. It emphasized the value of the home market and showed how many branch industries had been attracted to the city. It asked for the maintenance of adequate tariff protection. After reading the brief, Mr. Stewart answered a number of questions with regard to the operations of Cluett, Peabody & Co., of Canada, Limited, of which he is managing director.

A. P. Willis appeared on behalf of the manufacturers in Eastern Canada of musical instruments. He presented a statement showing the extent of the industry and emphasizing its importance. Its employees were skilled in their own work and much hardship would be caused, if through lack of adequate tariff protection, discriminatory legislation or other causes, piano factories were forced to close down. Referring to tariff protection on musical instruments in other countries, Mr. Willis said that practically all were higher than in Canada. Protection, he claimed, was of vital importance to give the industry an assured home market and to enable manufacturers to operate their factories economically. Mr. Willis concluded with a criticism of the excise tax.

Robert A. Willis, Vice-president Willis & Co., Limited, spoke along similar lines contending that with protection, Canada would build up her industries and attract capital for the development of her natural resources.

Charles D. Patterson, Director of Willis & Co., Limited, complained of the way in which pianos were classed as luxuries and declared that music was one of the necessaries of life. He said that nothing should be done to make it more difficult for the people to get their music and that the industry was worthy of encouragement.

W. J. Sadler, Sadler & Haworth, appeared on behalf of the manufacturers of leather belting and, after giving information about the industry, submitted that the industry was entitled to reasonable encouragement, especially in view of the fact that it provided a home market for green hides, tallows and greases.

Jack McAvoy presented a supplementary statement on behalf of the Market Gardeners' Association of the Province of Quebec, showing how, following the tariff revision of 1907, market gardening expanded until there were now 3,000 market gardeners in the vicinity of Montreal, with a large investment in hot beds, rolling stock, etc. As an inducement to continue in business they needed the guarantee of the home market.

Paul Watties, of the same Association supplemented the evidence of Mr. McAvoy.

J. D. Palmer, Hartt Boot & Shoe Co. Fredericton, presented an exhaustive brief on behalf of the boot and shoe manufacturers of Canada, giving statistics of the industry, and showing how, with the raising of the tariff in 1906-07, it has experienced large expansion. It was now the sixth industry in importance in Canada. It could not be doubted that expansion was due to the tariff and, therefore, it was necessary that the tariff should be continued. Mr. Palmer answered a long series of questions on various aspects of the industry.

Able to Specialize

J. H. Rieder, Ames-Holden-McCready Limited, in support of the shoe manufacturers' brief referred to the way in which United States' manufacturers were able to specialize and claimed that if protection was removed, they would have to get out of the manufacture of boots and shoes and import foreign-made shoes.

H. R. Ressler appeared on behalf of Canadian Buttons, Limited, a company which started operations on May 1, 1921, and is the only one in Canada at the present time manufacturing metal parts for covered buttons. He asked for increased protection so that they could be assured of the home market and thus increase their production.

S. F. Rutherford appeared on behalf of the Dominion Box and Package Co., Limited and of the manufacturers of wooden boxes in the City of Montreal. He presented statistics of the industry a

ated that, were it not for the tariff, hich assured them the home market, it ould be impossible for them to sell boxes s cheaply as under present conditions.

Art. Harris, President Canada Paper ox Co., Limited, made representations on ehalf of the paper box manufacturers of ontreal, of whom there were fifteen in ie city. Giving a general review of the dustry, he asked that the present tariff e continued without change.

Pins and Fasteners

J. W. Fawcett, presented a statement n behalf of the Colonial Fastener Co., id the Imperial Pin Co., Limited. Had not been for the tariff, he said, these usinesses could not have been started. e submitted that the present measure tariff protection was necessary in der to give them an assured market.

Albert Neighorn, General Manager, ichols Chemical Co., Limited, made a atement with regard to the heavy emicals industries. He reviewed the dustries and gave reasons why tariff otection was essential to their success.

W. L. Carr, representing the Monal Milk Producers' Association, which as composed of about 1,000 farmers in e vicinity of Montreal, declared that ey were in line with other farming in-ests in Eastern Canada. They were in vor of a general revision downward of e tariff, especially on all implements d machinery used in production. He imed that prices were fixed by world rkets and the only way to meet condi-ns was to do something to lower the t of production. He painted a picture rural poverty which he contended uired some remedy.

Second Day

Nov. 16.—Theo. H. Wardleworth, representing nine industrial chemical compies and ten pharmaceutical chemical mpanies, declared that, taking the hmical business as a whole, the tariff vas not in any sense protective when mpared with other industries. At the same time, he claimed there was no reason for any decrease in any of the duties. Any reduction in the tariff would men in some cases a serious threat to many chemical industries already established.

J. F. Frame, K.C., appeared for the provincial governments of Saskatchewan and Manitoba and read a short paper. His main point was that the textile manufacturers should be required to show the price of the continuation of protection. How much does it cost to manufacture certain line of textiles in Canada and how much in the United States or Great Britain. He believed that there should be a searching judicial investigation. He reviewed the whole course of the Board of Commerce investigation.

Sir Charles Gordon, for the cotton textile industry, first dealt with the Dominion Textiles Company and gave facts and figures about its organization and capitalization. He showed how the company had taken hold of properties that had had no earning capacity, as proved by a series of years, and by prudent and careful management had brought them to a point where they had an earning capacity. Dealing with the cotton textile industry in general, he answered the criticism that it was not indigenous to the country and that wages in the industry were not in line with those paid by other industries. He refuted the accusation of excessive profits and read a series of letters from large customers defending the tariff and showing that their prices were moderate and compared favorably with the prices of imported goods.

F. O. Callaghan, President of the Board of Trade of Cornwall, submitted a resolution passed at a special meeting of the Board on November 12, which, after stating various facts about the industrial life of the town, urged that no downward revision be made in the tariff.

Mr. Stiles, ex-Mayor of Cornwall, gave evidence, showing how farm values had increased in the neighborhood of the town.

Valleyfield's Industries

A. Plante, K.C., Valleyfield, spoke as a private citizen and described the value of Montreal Cotton Co. to the town, asking for continued protection for the industry.

S. W. Laroche, M.D., Mayor of Valleyfield, corroborated the evidence of Mr. Plante.

D. D. McBain, Valleyfield, a farmer, spoke in favor of the home market and said that the farmers around Valleyfield did not consider the duty on farm implements of any account at all.

A. O. Dawson, Vice-president and Managing Director, Canadian Cottons Limited, dealt chiefly with the operations of that company. He showed how their operations compared with those of competing companies of equal magnitude in England and deduced that they were entitled to protection. He also gave price comparisons. He further showed what the company was doing to improve the living conditions of employees.

H. W. Weller, President of the Canadian Association of British Manufacturers, said that while the Association was fully in accord with the general principle of a protective tariff, it would like to see the British preference substantially increased. Also, it would like to see a duty placed on goods at present imported free, but with a continuance of free entry for goods of British manufacture. Items in the present tariff militating against British exporters were listed.

J. Bruce Payne, Granby, spoke on behalf of the industries of that town. He gave an historical survey of its industrial growth and showed how its prosperity depended on the tariff. He also told of the progress of the tobacco industry in which he was interested.

Alderman Giddings, Granby, supported the position taken by Mr. Payne.

A. H. Clement presented the brief of the United Farmers of Quebec in French. It reiterated the story of rural depopulation and asked for the gradual abolition of the duty on farm implements. It virtually repeated the demands of the Canadian Council of Agriculture.

John C. McCallum, farmer, Labelle, Vice-president of the United Farmers of Quebec, took the same ground as Mr. Clement.

Third Day

Nov. 17.—W. W. Butler, president Canadian Car & Foundry Co., Limited, read a brief giving the views of fifteen companies in the Montreal District engaged in the steel and iron industry. The brief enumerated various reasons why protection was necessary and urged that no change should be made in the tariff on iron and steel and their products.

T. P. Howard, managing-director Phœnix Bridge & Iron Works Co., Limited, read a brief on behalf of the fabricators and erectors of steel structures, which emphasized the essential character of the industry and pointed out its disadvantages in competition with United States firms. To give the Canadian consumer the best service, it was of the greatest importance that the industry should reach its maximum output, and this could only be done by restricting foreign competition.

John H. Shaw, on behalf of the British Agents' Association of Canada, representing 400 of the largest British textile firms, asked that the British rate of preference should be increased and extended to include all parts of the Empire; that the wording of the second price column on invoice forms regarding "The fair market value for home consumption at time shipped," be changed so that there could not be any possible difference of opinion regarding its interpretation and that, in the conversion of currency, the customs authorities should obtain the rate of exchange daily from the banks and notify their collectors. They opposed any increase in the tariff on textiles.

The Silk Industry

G. F. Tompkins, Belding-Paul-Corticelli, Limited, Coaticook, appeared on behalf of the companies manufacturing braids, tapes, laces, embroideries, cords, etc., numbering some twenty in all and employing more than 1,600 persons, and presented arguments in favor of continued protection for the industry. He also read a letter from the mayor of Coaticook asking that nothing be done to jeopardize the town's interests by injuring the local industries.

I. Greenberg, Greenberg Smith Co., Montreal, read a brief on behalf of the Canadian cloak and suit industry, which reviewed the extent and operations of the industry, and asked that the duties on women's outer garments imported under the general tariff be increased so as to provide a difference between the duty on materials and on the finished garment; also that the dumping clause be strengthened.

A. Sommer, A. Sommer & Co., Limited, answered a series of questions which tended to show that Canadian manufacturers were not standing up against the competition of American manufacturers.

Labor's Position

John T. Foster, president Montreal Trades and Labor Council, presented a brief on behalf of a general committee of that body, endorsed as well by the railway brotherhoods. The committee represented 90 per cent. of the organized workers of Montreal. The brief reiterated the request for the creation of a permanent advisory tariff board. This was dealt with under seven heads—first, reasons for the request; second, the sort of board proposed; third, the intimate relation of the tariff to the life of the worker; fourth, reasons for dissatisfaction with the present system; fifth, reason for beneficent effect of board on lives of the workers; sixth, why greater stability and steadiness of employment would follow appointment of board, and seventh, free-trade agitation in relation to industry.

David Giroux, representing the Canadian Federation of Labor, appeared to support the argument for protection and to solicit from the Government a law similar to that which was enacted in the United States in 1875 and amended in 1885, in regard to alien labor.

R. H. Gillean, the Watson Foster Co., Limited, appeared on behalf of the wall paper industry of Canada and, following the plan of other representatives of manufacturing industries, gave a review of the extent of the industry and stated a number of reasons why protection was vital to its success.

J. A. Lareau, mayor of Richelieu, director of the Compton Co-operatif and director of the Union of Farmers of Quebec, spoke along the lines of tariff reduction and complained of the high cost of commodities and the shortage of labor.

Imports of Dyes

H. Brock, Canadian manager for L. B. Holliday & Co., Ltd., manufacturers of dyestuffs, Hoddersfield, England, asked that a British preferential duty of 5 per cent. and a general tariff duty of 20 per cent. be imposed on all importations of aniline dyes. With such duties, they would be justified in establishing a branch industry in Canada.

J. T. McCall, Drummond, McCall & Co., Limited, made representations on behalf of the merchants and importers in the iron and steel business. They were strongly of the opinion that, as the business development of the country had been based on the policy of adequate protection to native industries and manufactures, it would be disastrous to change that system. They advocated Government assistance in prospecting for and developing bodies of iron ore and suggested that, when new industries asked for protection, these requests should be most carefully investigated. They further urged a simplification of the existing tariff and stated that their business would be seriously interfered with unless the tariff on iron and steel articles, whether manufactured in Canada or not, was such as would not prevent their reasonable importation from abroad for the benefit of the manufacturing consumers of the country.

R. P. Sparks, Sparks-Harrison, Ltd., Hull, appeared on behalf of the Canadian Association of Garment Manufacturers, and gave a long array of facts about the industry. He submitted that the Government would be justified in increasing the net protection accorded the industry and claimed that it was to the general advantage of Canada to maintain and develop, as a home industry, one that played such a large part in the industrial development of the country.

Industries of Lachute

C. Tremblay, chairman of the Finance Committee of the Lachute Town Council, read a brief showing what the manufacturing industry had achieved in the town under a protective tariff. He concluded by saying that "inasmuch as the industries in Lachute have made such progress under the protective tariff and the interests of almost the entire population are so closely related to the welfare of these industries, no experiment should be made in replacing to any extent such successfully applied principles and their consequent practical results by a different fiscal policy."

General A. E. Labelle, president of the Canadian Millers' Association, submitted a statement on behalf of that organization. This gave an exhaustive summary of the industry and contained the statement that, "The Canadian milling industry believes it is in the best interests of Canada that there should be a moderate duty upon both wheat and the products of wheat."

R. B. Sauvage appeared on behalf of the Farmers' Propaganda Committee of the Province of Quebec and reiterated the statements of former farmer witnesses to the effect that agriculture was suffering from lack of labor and that profits were very small.

J. L. Marcil, agent of the United Farmers of Quebec, dealt with the emigration of Quebec farmers to the United States.

Fourth Day

Nov. 18.—E. D. Mathieu, representing the manufacturers and some farmers of Terrebonne, presented a memorandum showing how the town had prospered under protection and how the agriculturalists had benefitted from the development.

F. R. Whittall, on behalf of the companies in the Montreal district manufacturing tin cans, showed how extensive the industry had become and how dependent it was on the tariff.

David K. Trotter, secretary of the Supply Dealers and Manufacturers Section of the Builders' Exchange of Montreal, stated that it was the opinion of the Section that the tariffs presently in force in the Dominion were of the greatest benefit not only to the building trades of Canada but also to the people of Canada generally.

British Imports

Arch. McGoun, K.C., presented a memorandum in which he advocated the reduction of the tariff to a purely revenue basis on imports from within the British Empire and the maintenance of the protective duties on imports from other countries. He claimed that out of 19,21 manufacturing establishments, not much more than 455 would be affected by British competition.

William Brodie, William Brodie, Limited, jute manufacturers, asked for certain changes in the present tariff. He suggested that cotton yarn for the manufacture of twine should be added to the free list, and made other suggestions.

W. B. Converse, secretary-treasurer Canadian Bag Co., Limited, appeared on behalf of that company and stated that the bag industry had perhaps less protection than any other industry in Canada to-day. He asked that the duty on jute cloth be made 7½ per cent. either from the U.S. or direct from India.

Omer Baillargeon, Lamontagne, Limited, made a statement on behalf of the company, in which he traced its history and gave particulars of its operations. He enumerated reasons why the tariff should be maintained on harness and parts.

The Cement Industry

F. P. Jones, Canada Cement Co., appeared for the Canadian cement industry and said that the success of the industry in Canada depended entirely upon the development of Canada, provided the industry was not discriminated against by any legislation. Mr. Jones reviewed the system of taxation and claimed that $250,000,000 was required from the customs tariff, which meant that the average duty should be 25 per cent. He advocated a uniform rate of duty on all imports, and instanced cases where he thought industries could be started in Canada if a duty was placed on certain commodities used as raw materials.

Albert W. Pell, treasurer, Lamont, Corliss & Co., appeared on behalf of three firms importing chocolate. He made representations to the effect that the present rate on chocolate was very much in excess of protective requirements and in fact so high as to be pra

ically prohibitive, and asked that the duty be reduced to 25 per cent.

J. J. Denis, M.P., presented a statement on behalf of the tobacco planters of the District of Joliette, which supported two propositions: (1) the present duty on foreign leaf tobacco of 40 cents a pound, on unstemmed leaf as it now exists, should be maintained, and (2) the duty of 5 cents a pound on Canadian raw leaf tobacco should be removed.

George F. Davis, vice-president of Bennett, Limited, Chambly Canton, P.Q., manufacturers of shoe supplies, asked that in view of the company's service to the boot and shoe industry, the fact that they were using Canadian materials, labor and capital and that the tariff on their products did not enhance prices, the Commission should leave unchanged tariff item No. 614, covering their products.

Duty on Wool Waste

S. E. Lichtenhein, president and managing director, Montreal Cotton & Wool Waste Co., Limited, asked for increased protection, claiming that a tariff of 20 per cent. general, 15 per cent. intermediate and 12½ per cent. preferential would be reasonable under existing conditions.

Jacques Cartier, city attorney, St. John, P.Q., told of the industrial progress of that city.

Alan Kennedy, Kennedy Mfg. Co., Montreal, manufacturers of insect powder, asked for increased protection.

A. W. Wright presented a statement on behalf of the printing industry in the Montreal district, which demonstrated the importance of encouraging the development of the printing trades. It asked for the continuance of at least the present measure of protection.

Fifth Day

Nov. 19.—S. J. B. Rolland appeared on behalf of the Canadian Pulp and Paper Association and presented a printed statement setting forth the views of that organization. This gave much valuable information about the industry and concluded with the statement that the industry was capable of practically unlimited expansion unless retarded or held back by restricting Governmental regulations or adverse tariff legislation.

J. L. Caron, representing the Montreal District Jewelers' Association, which includes manufacturers, wholesalers and retailers, gave statistics of the industry and asked that the present tariff be not reduced.

W. P. Downey appeared to urge equalization in customs duties on "Honey-o" and "Nulomoline," products prepared from refined honey. He showed that the present tariff demanded nearly double the duty on products entering into "Honey-O," which is a Canadian manufacture, than on imported "Nulomoline," the American equivalent.

George A. Harcourt appeared on behalf of the Clothiers' Association of Montreal, manufacturing men's and boys' clothing. He showed that the condition of the industry at present was a serious one and the effect of any tariff reduction would be disastrous. He was supported by Alex. Christie, the Christie Clothing factory.

The Montreal Branch C.M.A., filed a statement by W. A. C. Hamilton, representing the Consumers' Cordage Co., urging that item 682 of the tariff be so regulated as to stop the importation of cordage, presumably for fishermen's use, but which is utilized entirely for other purposes.

The Montreal Branch also filed letters from three soap manufacturing companies asking that the duty on common or laundry soap be changed from a specific to an *ad valorem* one of 20 per cent.

R. A. Nixon, secretary Henry Morgan & Co., Limited, headed a deputation of merchants protesting against the luxury tax.

F. W. Stewart, Cluett, Peabody & Co. of Canada, Limited, expressed the appreciation of those who had attended the sittings of the Commission in Montreal for the way in which the Commissioners had listened to the different members of the C.M.A., who had appeared.

HAMILTON.

Nov. 26.—The Inquiry was opened in the Council Chamber, City Hall, at 10 a.m. E. H. Jones, Canadian Yale-Towne Co., Limited, St. Catharines, was the first witness. He gave facts to show that the growth of St. Catharines was largely due to industry fostered by the protective tariff.

Col. Gregory appeared as a private individual, declaring that the fruit growers of the Niagara district were opposed to any change in the tariff protecting their industry.

Arthur Robinson, the Maclaren Co., Limited, department store, St. Catharines, said that if the tariff was a little lower they could import more, but if there were no industries, they would not have so many customers.

James A. Scace, manager Piano Cases & Phonographs, Limited, Brantford, presented a statement on behalf of the city of Brantford, in which the industrial growth of that city was traced. He contended that Brantford's industries could not have grown as they had done were it not that the protective tariff gave them a large domestic market.

John H. Day, farmer, Brantford Township, gave evidence in support of protection, contending that it built up the home market, which was of the greatest value to the farmer.

W. H. Whitaker, manager Goold, Shapley & Muir Co., Limited, Brantford, gave evidence as to discrimination against Canadian manufacturers of farm tractors.

John Clark, town clerk, Dunnville, told of the growth of the town under the protective tariff and gave figures showing how the farmers were prospering in the neighborhood.

B. L. Edgecombe, mayor of Dunnville, corroborated the remarks of Mr. Clark.

William Eglesham, farmer, Flamboro' Township, near Dunnville, gave evidence to prove the value of the home market to farmers.

Alex. Camelford, Dominion Hammock Co., explained how serious would be the effect of any reduction in their protection.

M. Vaughan, Vaughan Seed Co., presented a statement dealing with the industrial growth of Welland, which claimed that this growth was largely due to the protection afforded by the tariff.

B. J. McCormick, Canada Foundry & Forgings, Welland, appeared more particularly for the industries of Welland and described the extent of their operations.

C. M. A. Statement

George H. Douglas, chairman, Hamilton Branch C.M.A., presented a comprehensive statement covering the manufacturing activities of Hamilton, and attributed its growth to the protective tariff, development of electric power and the specialization of farming in the Niagara District. He emphasized the extent to which U.S. companies had located branches in Hamilton.

Robert Hobson, president Steel Co. of Canada, Limited, presented a brief in which three lines of thought were followed out: (1) The need of adequate protection for the proper growth of the steel industry; (2) The low rate of protection afforded under the present tariff, and (3) The probable effects of the adoption of a free trade policy. At the conclusion of the brief, Mr. Hobson was questioned at considerable length, being supported by R. H. McMaster.

J. M. Patterson, mayor of Paris, told about the thriving nature of the local industries and said that it was essential that protection should be continued.

R. A. Haire, Alabastine Co., of Paris, stated that if protection was removed their business would be very small in comparison with what they had at present.

Views from Paris

Henry Reader, dry goods and boots and shoes, Paris, took a strong stand in favor of protection.

Robert Atkins, farmer, living four miles from Paris, gave evidence that the general condition of the farming community was prosperous.

A. J. Gamble, president, Independent Labor Party, Dundas, spoke in favor of a permanent tariff board.

Col. A. F. Hatch submitted a statement on behalf of the iron and steel manufacturers of Hamilton and said that the industry needed an assured home market so that they could manufacture

(*Continued on page* 254.)

A Comprehensive Project for Developing Power in the Niagara River*

By T. KENNARD THOMSON, D.Sc., M.E.I.C.

IT seems that there will shortly be a new treaty between the United States and Canada, permitting the utilization of more water for power on both sides of the river. In view of this there are already many applications for rights of water power under such treaty. It will surely be a great crime to allow individuals in either, or both countries, to obtain such rights until the entire project has been considered as one international unit, in order to obtain the maximum amount of power at the minimum of cost.

The Niagara River should, of course, be considered first. Here a dam should be constructed four miles below the Niagara Falls obtaining thereby a one hundred foot head, which, with a flow of 220,000 cubic feet per second will give two million horse-power a year. This will practically develop the entire minimum flow of the Lower Niagara River, and when this is done, as it absolutely must be done sooner or later, it will give one million or more horse-power out of the lower river, or ten million tons of coal a year more than could be obtained by any other plan or combination of plans which have been suggested by anyone.

This proposed dam can be constructed four miles below the Falls on Foster's Flats, in such a manner that one-half or more of the dam can be built on dry land now known as Foster's Flats, without touching what is now the bed of the Niagara River. When this half of the dam is completed the river can be diverted from its present channel so as to pass through tunnels in the first half of the dam thus completed. These tunnels will be from twenty to thirty feet below the bed of the present river, so there will be no trouble in getting water to flow through them. It will then be a comparatively simple matter to construct the second portion of the dam, which will be in what is now the bed of the Niagara River.

Diversion of River

After this dam is completed, and then only, it will be possible to divert half the flow of the Niagara River above the Falls and return the water so diverted to the Niagara River directly below the Falls, thereby obtaining another two million horse-power, making four million horse-power in all. These two projects do not interfere with any of the present power plants in any way whatever, although they would render the Chippawa-Queenston Canal, and similar contemplated diversions, unnecessary after the completion of our projects.

My reason for saying that more water cannot be diverted from above the Falls unless it is put back in the Niagara River directly below the Falls and until my dam is built, is because there is now barely enough water flowing over the rocks in the Rapids to carry the ice away.

And, as a proof thereof, some dozen years ago a slight change in the wind at Buffalo held back the water for a few minutes at Buffalo, with the result that an ice jam was formed in the Lower Gorge, which lasted some eight hours, and before it broke considerable damage had been done to the power plants at the Falls, and when it broke everything in the river below, within twenty or thirty feet above the water's edge, had been absolutely carried away.

Effect of Ice Jam

An engineer, in making a statement as drastic as this, ought to go back farther than a dozen years ago, so attention is here called to the fact that some million of years ago something dammed the Niagara River and caused it to cut a brand new channel at right angles to its old course, thereby forming the Whirlpool, and to cut the brand new channel out of bed-rock. The probabilities are that an ice jam diverted the 220,000 cubic feet of water per second and caused this new location of the River and Falls, which, if it occurred now, would cause one of the greatest catastrophes in history.

Therefore, I trust, gentlemen, that you will not allow either country to get the from ten to fifty thousand cubic feet per second that they are asking for, until the two Governments consider the matter as one comprehensive unit; thereby obtaining the maximum amount of power at the minimum of cost.

I have no hesitation in saying that $100,000,000 would be more than ample for the entire construction of my proposed dam, power houses, etc., making a total cost of $50 per horse-power, as against $100 a horse-power of the five pioneer companies, who risked their money on what was practically an untried venture in those days.

As our dam will take care of the entire minimum flow in the Lower River, all minor projects simply add to the cost of power to the consumer forever, without obtaining any additional power.

I had this project locked up in my safe for some eight years before I showed it to the Hon. Peter A. Porter in 1915. Mr. Porter at once joined me, and since th time we have been working together this project continuously. Mr. Porter 1886 obtained the rights for the first the pioneer companies at Niagara Fal We have applied for a franchise for th dam four miles or so below the Fal Recently Mr. Porter asked me to desi a plan for a tunnel under Goat Islan which I have done, and we have appli for rights for such a tunnel as the Port Thomson Tunnel. The tunnel would from 2,500 to 3,000 feet in length a has the most economical location p sible for developing additional power the old Falls.

When I first published the plans f our dam, people ridiculed the idea th there would ever be a demand f 2,000,000 horse-power in the Niagar So, before the war, I wrote to Mr. Samu W. Rogers, Director of the Censu Washington, D.C., and asked him h much electrical power was then bei used in the State of New York, a what the normal rate of increase wa He sent me a very comprehensive rep indicating that we were then using ov 3,000,000 horse-power in New York St alone, and that the normal rate of crease was ten per cent., or 300,(horse-power. In other words, our da would only supply one-third the amou of horse-power then being used in N York State, and could only supply normal increase for three years, on basis that each country received h the amount of power.

Transmission of Power

Niagara Falls power is now tra mitted to Syracuse, a distance of miles, with a loss of less than ten cent. at a voltage of 60,000. By incr ing the voltage to 110,000 it is tra mitted to the Detroit River, a dista of 250 miles, with about the same l By again increasing this voltage 220,000 volts, it would be possible double the distance of transmission the same loss. That is to say, we co distribute Niagara Falls power withi radius of 500 miles, which would in clude parts of nineteen States of t Union, and two Provinces of Can a. This area would include 60 per cent of the entire population of the Un d States, and 80 per cent. of the er re population of Canada; which would en be within commercial reach of is power, and yet our dam would ly supply one-third of enough for on of the States, on the basis that half he power is given to each country.

As a matter of fact, every bit of p er we can develop can be sold within 00

* Address delivered before the Ontario Division, C.M.A., Thursday, December 16, 1920.

miles of the site at which it is developed, and there will never be enough water-power to go around; so manufacturers who get the cheap water-power will have an unfair advantage over their competitors who cannot get it. For this reason, no matter what price electric power is sold for, it will always be worth what it costs to develop the same power by coal.

Before the war, the highest grade plants in New York City developed electrical power from coal at an average cost of $32.19 a horse-power. I am referring to such high-grade companies as New York Edison, Interborough, etc. That means $70 or $80 per horse-power in the United States, and much more in Canada. Our power could be sold at from $5 to $10 per horse-power, plus the Government tax.

To scatter Niagara power broadcast and even then only supply a few favorite consumers, would be to get only half or less of its value, and many indirect advantages which would be enormous would be lost if the power is so scattered. For an example: The five pioneer companies spent $65,000,000 to develop 650,000 horse-power, with the indirect results of attracting private capital to the extent of $650,000,000, or ten times what they spent themselves. So if we transmit the 4,000,000 horse-power developed in the Niagara River broadcast, the benefit would be but a small fraction of what they would be if the power were sold at the site, thereby creating the greatest manufacturing district in the world.

It should be remembered that one and one-half cents per kilowatt power is $100 per horse-power per annum.

We recommend, therefore, that the power be concentrated and sold at the power site and that the Governments decide how much tax to put on this power, in order that everybody in the state and province will be benefited thereby. At the same time, while the Governments are settling the Niagara Power question, they should also settle the St. Lawrence River problem.

My project for Montreal would be to put a dam in the Lachine Rapids, taking advantage of a 44-foot head, and by dredging the channel to a depth of 30 or 40 feet from Montreal to this dam, ocean vessels could reach the dam without passing through any locks.

One or two locks would then raise the boats up to the Lake St. Louis level. In dredging this channel we could reclaim ten square miles of land from the St. Lawrence River, which would be connected with Montreal by tunnels. We could obtain about 1,000,000 horse-power at this site. The other two big drops in the St. Lawrence River are between Lakes St. Francis and St. Louis eighty-three feet, and the stretch of 50 miles west from Lake St. Francis ninety-one feet. We could obtain nearly 4,000,000 horse-power out of the St. Lawrence, which with 4,000,000 from the Niagara, would be 8,000,000, or to be conservative, say 6,000,000 horse-power a year, which is equivalent to 60,000,000 tons of coal a year. This certainly would result in the greatest manufacturing centre in the world all the way from Montreal to Lake Erie.

Location of Proposed 100-foot Dam

The dotted line indicates the present shore line of the river, showing how half the dam can be built on dry land

The late Sir William Van Horne stated shortly before he died that the carrying out of my Montreal project alone would make Montreal one of the greatest sea ports in the world.

The former president of one of the most important Chambers of Commerce on the continent, once told me that his Chamber of Commerce would never endorse any project until that project was sure of success. The reason being, that the various members who had risen to the top of the ladder through their energy and business sagacity would not jeopardize their reputation for sound wisdom by endorsing undertakings which might possibly not be carried out.

It seems marvellous to me that some of the business men of Montreal, Buffalo, and New York, object to the development of the St. Lawrence River route. They thus lose sight of the fact that the prosperity of their respective cities depends often on commodities which never come within 100 or 1,000 miles of their city. For example: New York City pays 25 per cent. of the income tax of the United States; but if there were no farms, factories, villages, towns, or other cities, then there would be no New York City. And, on the other hand, every dollar's worth of prosperity enjoyed by any of the farms, factories, villages, towns or cities in New York State, in the United States, or even in Canada, send their portion to benefit New York City; which, according to the New York Chamber of Commerce amounts to 25 per cent. of the entire wealth of the United States. And at the same time, every part of the States and even Canada benefits by the prosperity of New York City. It is also argued that the development of the St. Lawrence River route would endanger the Barge Canal, an absurd fallacy, for the proper development of the St. Lawrence River route, and of the water-power in the Niagara and St. Lawrence rivers, would result in manufacturing centres equal to more than ten Pittsburghs on the Canadian-American frontier; which would result in the Barge Canal being black with traffic.

New York's Objection

In opposing this route, the New York Chamber of Commerce objected chiefly on account of the great cost to the Governments, which, they said, would amount to from three to five hundred million dollars and the injury of the Barge Canal (which I consider imaginary).

If the two Governments will get together and allow us to develop these two

rivers under one comprehensive plan, we would spend:—

On the St. Lawrence	$500,000,000
For Niagara Dam, Thomson-Porter	100,000,000
For my Lachine project	100,000,000
To develop the rest of the work and buy the Barge Canal outright, and also buy the Chippawa Canal	300,000,000
Making a total of	$1,000,000,000

But if this would supply $600,000,000 worth of coal a year, the return would be 60 per cent. on the investment.

By commencing work at Montreal and our dam in the Niagara River, it would be a very simple matter to finance the rest of the work.

It would be inconceivable to have this carried out under Government ownership in the old sense of the word, or as a private ownership in the old sense of the word, but on the other hand, if the two Governments will agree to a common-sense contract which would give the Governments control of the design, construction, operation, selling price of the power, collection of taxes, and finally, a commission to be paid us for furnishing capital, doing all the work, and selling the power; then the two Governments would be able to get ample draft for ocean-going vessels to the Great Lakes, get 6,000,000 horse-power a year, and build up an undreamed manufacturing centre resulting in unheard-of prosperity for the whole continent, without the expenditure of a single cent except a trifling amount for supervision, which would be as nothing as compared with the taxes collected.

The expenditure of one billion dollars on the frontier without asking financial assistance from the Governments, would be of such great benefit to the entire country—to say nothing of wiping out the premium of exchange, and the attraction of all the additional private capital which, as we have said amounted to ten times the amount spent by the five pioneer companies at Niagara Falls, would be of such great value to the people of Canada and the United States that it would be a boon well worth while even if we paid no taxes and were allowed to sell the power for what it is worth.

Yet we offer to pay whatever taxes the Governments ask and let the Governments decide the price to be charged for power.

There would be very few parts of the world that would not be benefited directly or indirectly by this undertaking.

Gentlemen, it is up to you.

A Made-in-B.C. Campaign

MANUFACTURERS of British Columbia have launched a big campaign for the increased use of "Made-in-B.C." products among the residents of the Province. A large fund is being raised for the purposes of the project; offices are being opened and a manager appointed acting under the advisement of a committee of business men.

Confronted by a period of business depression, and with thousands of unemployed seeking work in Vancouver and the other cities, the manufacturers decided that instead of following the trend of the times by reducing production, they would endeavor to increase the output of their respective industries. In order to do this the possible and probable markets were closely scrutinized, and it was determined that before trying to enter competitive foreign fields, the home market should be captured, so like charity they began at home.

The movement was initiated recently at a large dinner held under the auspices of the manufacturers bureau of the Board of Trade. It was largely attended and of a most enthusiastic character. So satisfied were those who attended the gathering that no time should be lost in starting the campaign that $6,000 was subscribed at the time to cover the preliminary expenses of organization. It is anticipated by the members of the committee that at least $72,000 will be necessary to make the success of the enterprise that is desired, and this sum they expect to raise without much difficulty.

The campaign is in reality wider in its scope than purely sectional movements of the kind usually are, for, as expressed by Mr. J. B. Thomson, chairman of the B.C. Division of the Canadian Manufacturers Association, who is one of the most active workers on the committee, the first endeavor will be to increase the sale of British Columbia made goods, and if these are not available to have the purchaser ask for those of Canadian manufacture, to be followed by a demand for the products of the Empire before considering imported commodities. This fostering of trade within the Empire was met with hearty and enthusiastic support.

The chairman of the committee, Mr. Frank Parsons, in outlining the proposals of the committee responsible for organizing the dinner-meeting, said that the programme would consist of extensive newspaper advertising, bill board appeals, educational work in the schools; by organizing "Made-in-B.C. Days" and "Made-in-B.C. Weeks," and by addresses delivered at luncheons and gatherings of clubs and semi-public bodies.

Not only are the manufacturers intent on increasing their daily sales, but they are anxious to improve, if possible, the quality of the goods they produce. In many lines the products of British Columbia far excel those imported into the province from foreign countries and for which there is a larger demand at a higher price. This situation is due to the reputation gained for the imported articles through extensive advertising campaigns. In this connection there is a growing desire on the part of manufacturers throughout the West to see the establishment of Canadian magazines of a high literary standard which will compare favorably with publications brought into the Dominion for the entertainment of the reading public.

The work of efficiently organizing and conducting a campaign of the proportions planned by the committee is a large task, but those behind the movement believe that they will be successful in their endeavors, and that once the idea takes hold of the public mind it will carry on indefinitely to the advantage of the province and Dominion.

The co-operation of labor will be sought, as will also the assistance of the retailers and their clerks. Labor has already shown a disposition to encourage the use of goods of local manufacture, realizing that the steady employment of the worker depends largely on the market for the commodity that he aids to produce.

The farming communities and agrarian organizations will also be invited to assist in the campaign. The agriculturist is vitally interested in the success of the movement, for the sale of his crops is made easier by the size of the industrial centres of the country and the demand for fruits, vegetables and grains which have passed through different processes of canning and milling.

Not only will those responsible for the conduct of the campaign seek co-operation from other classes of the community, but they plan a thorough review of the purchasing possibilities of themselves as a class. Every manufacturer in the province, and there are more than 1,000 in addition to those engaged in the lumbering and mining industries, will be provided with a list of the products of the other fellow's plant, and they will be impressed with the necessity of making use, wherever practicable in the manufacture of their own wares of "Made-in-B.C." goods.

There have been "Made-in-B.C." campaigns in the past, but they failed to accomplish the objective it was intended that they should attain. There were reasons, which need not be reviewed at this time, why success did not meet these efforts. Suffice it is to say that the mistakes made then will not, in all likelihood, be repeated in this campaign. The Vancouver Board of Trade, through the manufacturing bureau, is behind the movement, and when the Associated Boards of Trade of British Columbia meet in Vancouver in February, it is planned by the educational committee of the "Made-in-B.C." organization to take the delegates from all parts of the province on specially conducted tours through the manufacturing plants of the city, and to secure the support of the delegates to the objects of the campaign

Our Annual Review of Industrial Conditions in Canada

FOLLOWING the plan adopted last year, we have gathered together in the following pages the views of a large number of Canadian manufacturers on current conditions in the manufacturing industries of the Dominion. These have been grouped together under the heads of the principal lines of industry, and will be found in their entirety to give a very fair idea of what conditions were like during 1920, together with the opinions of manufacturers as to the outlook for 1921. Owing to the uncertainties which developed during the latter half of 1920, the importance of this symposium is all the more apparent, and we trust that manufacturers generally will derive renewed confidence from the optimistic note that is sounded in the majority of cases.

It will be found that the conditions experienced during 1920 were practically uniform in most industries. That is to say, the activity developed during 1919 extended well into the past year. This was accompanied by a scarcity of raw materials and labor, with their attendant difficulties in the matter of slow deliveries and delayed production. As the months passed, however, and the second half of the year was entered upon, conditions began to change quite rapidly. Consumer buying fell off and, as it declined, the whole fabric of business became affected. Manufacturing industry felt it in a general loosening up of the raw material market and in a much improved labor supply. It also felt it in curtailed buying, which in many cases caused a reduction in operations that has greatly slowed down production.

With here and there a more pessimistic expression of opinion given voice to, the general view seems to be that by spring there should be a return to normal buying. It is contended that the recent epidemic of "no buying" will soon disappear; that it cannot possibly last. This will set the wheels turning once more and gradually build up business on the solid groundwork of genuine demand. It is pointed out by several contributors that stocks of goods are really low in a great many lines, and that they must soon be replenished. Further, the removal of the luxury tax, which was complained of by many, should have a beneficial effect in all departments of business.

There are many grounds for optimism indicated in the pages that follow and, if readers would only saturate their minds with these reasons, the influence thus exerted would have a most beneficial effect. Getting the right viewpoint is a great help towards a sensible handling of the situation.

THE METAL INDUSTRIES

Revival by Spring

By Robert Hobson

President, Steel Co. of Canada, Limited, Hamilton.

DURING the year 1920 we have had no difficulty, as a rule, in obtaining the necessary raw materials in connection with the manufacture of steel, with the exception of coal. Coal, during the year up to about 1st November, was very difficult to secure by reason of the reduced production in the early part of the year and through inability of the railway companies to supply sufficient cars.

We have had more or less difficulty with labor this year. For a number of weeks, our engineers, firemen and water tenders were out on strike at our Hamilton works and at Montreal our rolling mills were shut down for over two months. Common labor was difficult to secure. At the present time more men are offering than we can take on. This particularly applies to mechanics and semi-skilled labor.

Up to now we have had a good market for all materials that we could produce, but there has been a falling off during November and December. Prices advanced during the early part of the year by reason of the great demand for materials and to the increased cost of production by reason of the high wages paid and to the general advance in the price of raw materials, particularly in the matter of coal. The process of deflation is going on, but it has not yet been completed. The deflation which is under way in all commodities—food, clothing, etc.—will of course have a bearing on the cost of manufacture.

Our export business during 1920 up to a few weeks ago, was very satisfactory, but owing to the foreign money market and exchange this business has dropped off very materially.

If labor becomes settled, particularly in the building trades, I look for a good revival of business in the spring of 1921, but if labor leaders still continue to stir up strife between the employees and employers, it will certainly cause the revival of business to be postponed.

Increased Demand in 1921

By W. C. Franz

President Algoma Steel Corporation, Limited, Sault Ste. Marie.

WE have experienced great difficulty in securing our coal supply during the past year, but now have sufficient in stockpile to run us through until the opening of navigation, 1921, and from present indications more reasonable prices for coal may be expected next year. We also have sufficient ore to operate to capacity until the opening of navigation next year, and do not anticipate any particular reduction in the price of ore, as there has been no speculation, the advances in price during the past two years only covering the increased cost of production and transportation.

We have not met with any labor difficulty, and have found a sufficient supply of both skilled and unskilled labor. We are also pleased to say that while labor efficiency is not yet what it should be, there has been a marked improvement.

The last quarter of this year is sho ing a particularly dull market in bo iron and steel, but everything indicat an increased demand during the fir quarter of 1921.

It is most difficult to predict pri movements in finished products for t coming year, but it seems certain th some iron and steel products will be r duced and others increased, as the pre ent price relation between pig iron an finished steel must necessarily be a justed.

We do very little export business, pri cipally on account of our location, an as a rule, we find customers in Canad requiring our entire output.

We can see no reason why the deman for iron and steel in Canada should n increase with the growth of the countr and we are strongly of the opinion tha with adequate protection, there is splendid future ahead for this industry.

All Essentials of Prosperity

By T. R. Deacon

The Manitoba Bridge and Iron Works, Ltd., Winnipeg.

AS we are engaged in the iron an steel business, making a prett wide range of goods, we were greatl hampered by the inability to secure rolle steel, sections, plates and sheets for tha branch of our work, and also pig iro and even scrap was scarce in the fir half of the year. The price was ver high until within the last three month Lately there has been a lowering price and a better supply available.

Regarding labor, in the first six mont of the year there was a very great shor age; wages were very high and th natural concomitant was that it was pr portionately inefficient. Matters in th respect have much improved during th last three months.

The present state of employment is sti fairly good and likely to remain so f the balance of the year, but prospec after the opening of the New Year a not at all good, as new orders have fall off to a large extent.

The state of the market for our goo during 1920 was good. Our differe plants ran to capacity during the ye except that a great deal of time was lo through shortage of material or the no arrival of material at the proper tim In fact, this accounts for our being bu to the end of the year, completing wo which should have been complet earlier, but could not be on account lack of material.

Prices during the year have remain practically stationary in our finished p ducts. The prices for the class of wo we do, railway equipment and suppli coal and metal mining equipme structural steel, railway highway bridg tanks, etc., being governed entirely by t cost of labor and material, there h been no inflation at any time, and th could be no deflation except as the pr of labor and material comes down. W

ne exception of pig iron and sheets, here has been no substantial reduction et and wages remain as they were.

The only exporting that we have done his year was about 400 tons of bars from ur rolling mill to the Orient, and a ouple of cars of switches and plates nd other track material, our plant being ccupied to its capacity with domestic equirements.

I am not in a position to express an pinion of value as to the outlook for 921. There has been a big crop in the Vest of a good quality, but the price has allen more than $1.00 a bushel for wheat, nd there is a tendency on the part of he farmer to hold his wheat, hoping that he higher prices will return. This has very great effect on business, and what he actual outcome will be is largely dependent on the psychological condition btaining throughout the country, and redictions are likely to be very unreable. We are far behind in our building equirements in the West. There is a ecessity for repairs and improvements n the railways, new immigration is oming into the country, and in the ormal condition of things one might sume that business would be good next ear. I am inclined to believe that when here is a moderate adjustment of extremely high prices of material and abor, that, after a short period of rather uiet trade, business will be resumed in onsiderable volume on a safer and more ormal basis than has obtained during he past two years. We have all the essentials in Canada to produce prosperity and comfort, and what is wanted to set us on the way to safe progress again is simply sanity and steadiness during the next few months.

A Hopeful Report

By H. J. Waddie

The Canadian Drawn Steel Co., Ltd., Hamilton.

DURING the past year we have found business very steady in our lines, and the demand has quite met our expectations. The supply of raw material during the first three-quarters of the year was very poor, but has improved latterly, but prices are not likely to be changed.

Wages have been advanced considerably, but in many cases the efficiency of the labor offering has been poor. We are employing the usual number of men, and find labor more plentiful during the past month or two. The prices in finished products are not likely to be reduced until some change takes place in the labor situation.

We do not believe that the export field will be developed until the home market has been caught up with.

We think that the outlook for 1921 is very good. The value of crops will tend to inspire confidence, and the construction work which was suspended during the period of the war, is now beginning to show itself.

Another feature is that money accumulated in the country and which in many instances was employed in taking up Victory and other loans, will now be available for development of manufacturing and general construction.

Look for Good Year

By G. F. Allan

Hoyt Metal Company, Toronto.

NINETEEN-TWENTY has been a very prosperous year for the Hoyt Metal Company. The last few months have necessarily shown quite a falling off and the market values of raw materials we purchase have declined practically to pre-war basis. As far as the deflation of metal values are concerned, all raw material used in our business, such as tin, lead, antimony and copper, are down to pre-war prices, probably with the exception of pig lead, which is only slightly above pre-war values.

We look for a very prosperous year for 1921, due to the fact that purchasing has only been done in the past year of immediate necessities, and bare necessities at that.

Should Take Losses

By John B. Goff

Dart Union Co., Limited, Toronto.

THE supply of materials has been ample with price tendencies downward. Labor has been in fairly good supply and generally efficient for our work with a fair wage. The market for our goods during 1920 has been excellent and price movements in finished products generally steady.

From the general trend, we would say the outlook was unpleasant. If manufacturers and distributors would base their price on present-day markets and in the proportion that they did in the past five or six years and be willing to accept their loss as gladly as they took their extra profits from stock on hand, it would seem as though it should help to arouse confidence. Then, too, it seems as though all parties concerned should endeavor to build up a little surplus of finished products in expectation of the time when there will probably be the heaviest demand we have ever had.

Running Full Capacity

By C. A. Collins

Canadian Furnace Co., Limited, Port Colborne.

WE have practically no pig iron in stock, nor do we believe that stocks in hands of customers are large. The price of our raw material is unchanged, except fuel, which has declined considerably. We will not feel the benefit of this decline until February or March, as our present contracts will supply all the fuel we can use until that date.

The supply of labor is ample; its efficiency good and wages are unchanged. They advanced in February of this year and are still at the high point. We are running our plant to full capacity and employing all of our men. We understand that in many localities iron and steel operations have been wholly or partially suspended, so that our situation is perhaps not representative.

The market for pig iron was good during 1920, we having operated our plant to full capacity, except for a period of about six weeks, when we were idle for repairs. During the early part of the year prices for pig iron advanced and have remained at a relatively high level until the present time. We expect to put into effect a reduced schedule in the very near future, probably December.

We do not know whether the process of deflation has been completed or not. In a general way we would be of the opinion that it had not, particularly on fuel and labor. We do not, however, look for a return to pre-war prices or wages. Certainly our own costs will not approximate the pre-war period, even if labor and materials should reach that point, on account of the tremendous advance in freight rates, which has greatly increased our cost of assembling materials and reaching our market.

We have absolutely nothing to gauge conditions for 1921. We believe, however, that basic conditions are good. The demand for iron and steel should be heavy in general lines, particularly for building, railroad material, agricultural implements, etc. There are, so far as we know, no surplus stocks of consequence in the iron and steel line, and it is not our purpose, nor that of any of our acquaintances, to continue to manufacture beyond the current needs of our trade. Under these conditions we do not look forward to a long period of idleness.

Employing Usual Staff

By C. H. Waterous

The Waterous Engine Works Co., Limited, Brantford.

MANUFACTURING industry is at present going through a period of change, in fact, practically everything in the shape of business is going through a transition period, and it will no doubt be a considerable time before we will get back again to what might be called "normal business."

I am rather under the impression that business is now so well in hand and controlled, as compared to what it was formerly, that the same upheaval will not take place in this period of change as was the case after former wars and former great disturbances.

The supply of raw materials is increasing; prices in many lines are decreasing. These decreases are properly, and for the good of the country, coming slowly.

The supply of labor is in greater proportion, and there is no doubt but what labor is more efficient. Wages in most lines have not been decreased. Until the cost of living comes down, it is better

that this should be the case. In our own line we are giving employment to our usual number of men, and hope to be able to continue this, at least during the winter.

During 1920 the market for most of our lines of manufacture was fairly good, and normal. In regard to prices of finished products, these are gradually tending downward. Deflation has certainly not been completed by any means. While we will never likely get back to the old price conditions, still there will no doubt be a very considerable change downwards before we get on to level ground again.

So far as our own conditions are concerned, export business has been comparatively small. The difficulties of transportation and exchange have probably, to some extent, been the cause of this.

With reference to the trade of 1921, this is a pretty hard question to answer. I believe about the only thing to do is to be as optimistic as possible, and meet conditions as they come. If people refuse to buy waiting for reduced prices, trade will undoubtedly be slack. On the other hand, if people become satisfied that prices are fairly normal, and they are not going to make anything or much by holding off needed improvements and requirements, business will probably be pretty fair. I do not feel that I am sufficient of a prophet to say with any definiteness what 1921 might bring us.

Will Increase Efforts

By C. A. Meadows

The Geo. B. Meadows, Toronto, Wire, Iron and Brass Works Co., Limited.

OUR raw material is arriving freely now and the price is down to about the base of March, 1919. There is a better supply of both skilled and unskilled labor at the present time, and we notice a marked increase in the efforts of most of our people. It is not our intention to reduce wages until forced by conditions to do so; rather, we have eliminated those of our staff who did not fit in and are improving constantly our conditions of production. I do not believe that any of the companies in our industry have yet had to lay off any of their regular staffs.

The market during 1920 for our products was good, but we were not able to take full advantage of the orders offering on account of the impossibility of obtaining sheet steel. We have made recessions in price of almost all of our lines. I do not believe the process of deflation has been completed yet, but I do believe that after the low point has been reached and has been in existence for a period, the length of which will depend entirely upon conditions, that there will have to be another period of inflation to care for the necessary expenditures for housing and so on.

Our developments in the export field has been absolutely deterred by the raw material situation.

Our policy for 1921 will be to increase our advertising and sales programme for this year. We will reach every possible source for business and on our own energy alone do we count for increasing our business. From present indications would reflect a very good year for us next year. We have been promised an extension of our banking facilities if we wish it; the commencement of operations at The Baldwin Steel Corporation will insure a steady supply of sheet steel and, as we have never had any labor troubles in our history, we do not look for any in the coming year.

Bottom Soon Reached

By B. W. Vallat

Dominion Forge & Stamping Co., Limited, Walkerville.

THE price trend on raw materials is down. Labor is plentiful with higher efficiency. Wages remain about the same as they have throughout the year. At present (Dec. 7) we are employing about 40 per cent. of our full force.

Our market was good up to the month of October when the demand fell off sharply. Prices on finished products are lower. We do not believe, however, that the process of deflation has been completed. While we are making a strong effort to keep up wages in this district, there is no question but what they will eventually have to come down in order to meet competition and lower prices for the finished product.

There is nothing definite in the outlook for 1921. As we look at it, it is all a guess at this time. If only from the fact, however, that the process of deflation and shrinking of values has been in progress for several months, it would seem that the bottom would soon have to be reached, so that, if there is any business at all, it should be on the side of improvement.

Revival in the Spring

By A. S. Capwell

The Canadian Blower and Forge Co., Ltd., Kitchener.

WE find that it is much easier at the present time to obtain supplies of all raw materials than it has been for many months past. As far as prices are concerned, however, there has been no appreciable reduction in the price of raw materials which we are using, although there have been slight reductions in the price of steel sheets, and shipments are now coming forward on orders which we have had placed for six or eight months.

Labor of all kinds can be had in sufficient quantity, and we find that the changed situation results in a tendency to give a full day's work for a full day's pay, more so than during any ti within the past two or three years.

As far as our own shop is concern we have been extremely busy, and expe to be for some time to come, althou there is a dropping off in orders whi we are receiving for our blacksmit line of tools. The volume of busine during the past year has been all th we could ask for, and we have be especially gratified with the develo ments of our foreign business, as expo orders have been coming in free although the present situation with t banks refusing to accept foreign bills exchange has held up shipments te porarily of a great many orders whi we have on hand.

We do not anticipate any price redu tions in our line for several months come unless conditions materially chang We think, however, that a downwa movement in prices is bound to result a short time, which we hope will stim late business for the coming year. our heating and ventilating line ente largely into the construction of ne buildings it is difficult at this time predict what the situation will be, there are a great many large constructi jobs which are held up until prices the building line reach a lower level. W are, however, optimistic as to the futu and do not look for any serious slum in business, but anticipate a revival early spring.

Running Overtime

By O. C. Sylvester

Canadian Mathews Gravity Carrier Co., Ltd., Port Hope.

WE have had little trouble in obta ing a supply of raw materials far as domestic production is concern Where we were obliged to import goo not manufactured in Canada, it has be necessary to place orders for some months' delivery ahead of our requi ments.

We have had no trouble in obtain efficient labor, but of course we have p just about double the usual prices. orders have been sufficiently large, that we have a full force and are runn overtime, that is to say, ten hours stead of eight, as we did a year ago.

The market for our goods has been that we could desire up to this ti (Dec. 2), but we anticipate some fall off during December. Prices have b stationary with us the past year, 1919 prices being still in force. flation with us depends upon steel pri also labor. We look for some lower of both in the next sixty days, but th has been but slight relief in this past year.

We are quite optimistic for trade coming year, and it is our belief t orders will be quite plentiful afte short period of depression that usu takes place during December and Ja ary. Any country that is rich in e

sources as ours and whose inhabitants consist of industrious, level-headed and law-abiding people will have prosperity, as it is the natural product of these conditions.

Labor Cost High

By F. E. Leonard

E. Leonard & Sons, Limited, London.

OUR supply of raw material comes from the United States (boiler plates, boiler tubes, coke and coal). The two first mentioned are not made in Canada, ship plates only being rolled in Nova Scotia. We do not think that the prices for these articles as set by the United States Steel Corporation unduly high considering present conditions of labor and cost of raw material. The delay in delivering, however, during the whole year, has been most exasperating to our customers and to ourselves. The same applies to all the smaller parts that go toward the manufacture of steam boilers. The supply of material and the shortage of help since the war, 1919-1920, has made manufacturing in our line drag and is very disappointing.

We had to increase our wages during the year, which we thought uncalled for, but it was necessary to hold our trade and workmen. The efficiency of the average workman for the last five years has fallen less each year as the wages increased. Even the honest and straightforward workman has not produced what he did formerly. Supply of employees has been very short. The following figures will give a comparison in wages, labor cost, and relative efficiency of our employees between the two years, 1912 and 1919:

	1912	1919
Average hourly rate per man	19.9c.	60c.
Average labor cost per pound of boilers, etc.	1.021c.	3.822c.

Ratio wages.. $\frac{1919}{1912} = \frac{60}{19.9} = 3.02$

Ratio cost per pound .... $\frac{1919}{1912} = \frac{3.822}{1.021} = 3.72$

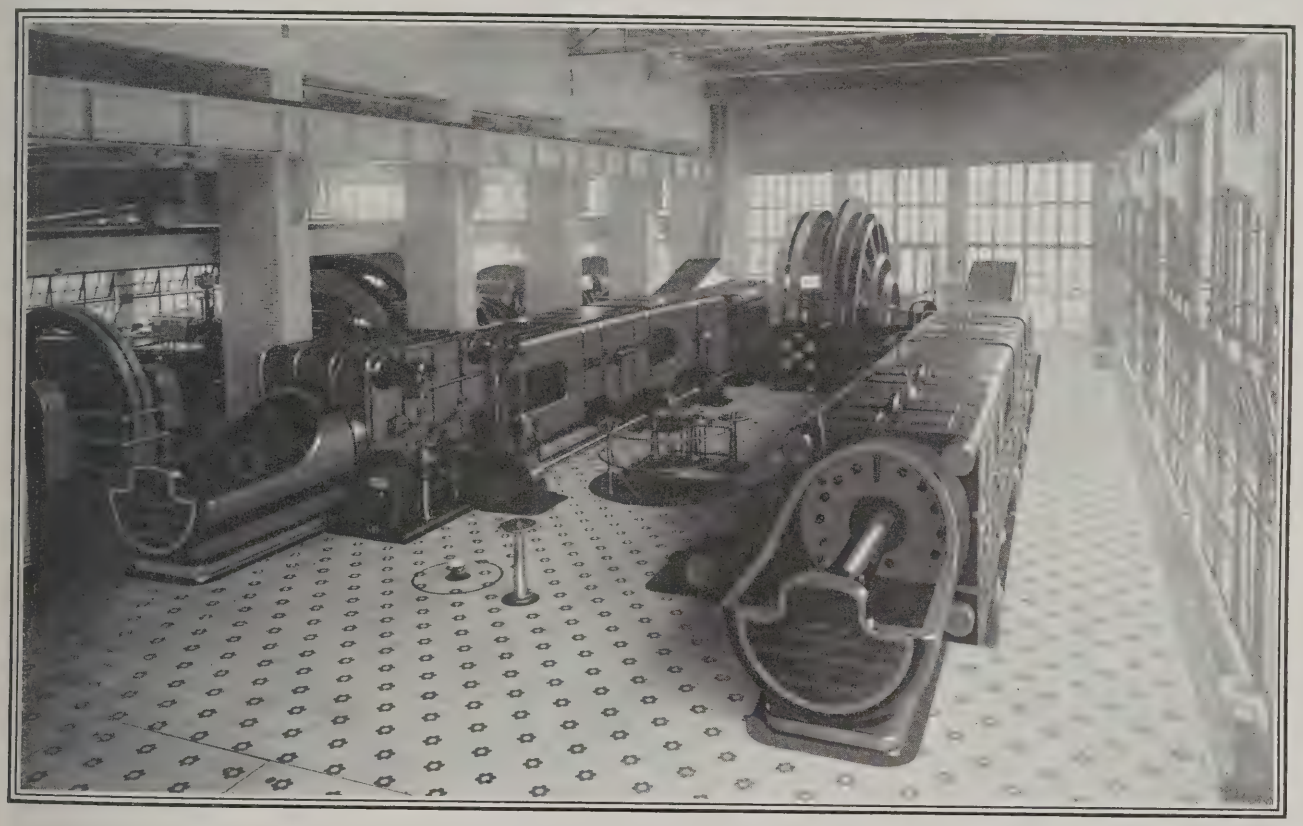
Decrease in efficiency of employees .... $\frac{.75}{3.02} = 24.1\ \%$ less.

The supply of both skilled and unskilled labor is greater at the present moment than our requirements.

The outlook for 1921 business in our line is one of uncertainty now that the cost of material and labor are falling. Once the purchasing public see this, they will put off purchasing until the last moment. We would do this ourselves. This is one side of the situation. On the other hand we have been blessed with the most abundant harvest, at the highest prices ever known, which will bring millions of money into Canada. There is every reason to think that we will have at least a good average crop for 1921, with thousands of people in Europe to be fed. Canadians have every reason to be optimistic. In fact you cannot keep Canada from progressing with its natural resources undeveloped. The country would stand two years of hard times and recover itself in the third year in our opinion. We all have a goodly heritage. Let us then face the New Year of 1921 hopefully.

Full of Confidence

By M. R. Meldrum



The Herbert Morris Crane & Hoist Co., Limited, Niagara Falls.

WE find that our supplies are coming along much quicker and with less urging on our part, but there is not much tendency for prices of materials to be reduced. Unless wages come down there does not seem to be much reason why the cost of material should diminish.

During the last few months we have found the labor market considerably easier, and we have therefore been able to increase the number of efficient workers in our plant, but wages remain about stationary. We have not reduced our working force in any way; in fact we have increased it somewhat by filling up gaps as suitable men present themselves.

The prospects for business are good, and we hope to continue at full pressure throughout the winter. In regard to the so-called process of deflation we have not much to say. We are aware that there has been considerable talk among bankers on this subject, but in our opinion it is rather related to the subject of the fourth dimension and we certainly have had no experience which appears to have any bearing upon it.

In regard to the year 1921, we are full of confidence. Canada has emerged from the great war with a burden relatively smaller than that of any other country

Here lead-covered cables are being sheathed with lead

with the possible exception of the United States. The undeveloped resources of Canada are such that in due time the national debt should be distributed over a large population. Already the tendency of producers to come to this country is clearly evident. With the increase of population both in the agricultural and industrial field, what looks to-day like a large debt will be steadily diminishing in relation to productive capacity. We can see no reason for pessimism and feel sure that our confidence is reflected in the minds of manufacturers all over the Dominion.

Foundation for Prosperity

By Wm. R. Yendall

Richards-Wilcox Canadian Co., Limited, London.

NOTHING stands in the way of making 1921 a year of excellent business except the possible refusal of manufacturers, jobbers or dealers to accept the new basis of prices. If we can all agree that it is to our common interest and to the national interest to accomplish the readjustment at the earliest possible date, and are willing to take the shortest path to that objective, the readjustment of prices can be accomplished within a very few weeks without hurting any legitimate interest seriously.

We think this will be done, and inasmuch as there still exists in the country and throughout the world a very large, unsatisfied demand for commodities of all kinds, we look for a good trade in 1921. Credit conditions are very much sounder than they were a year ago, labor is much more efficient, the men who were drawn away from the farms during the war to make munitions are getting back on the land, economy is taking the place of waste. These things all constitute the best possible foundation for prosperity of all classes.

Decline to be Gradual

By George A. True

Northern Crane Works, Ltd., Walkerville.

PRICE trends in raw materials are somewhat downward but not so much as current reports would indicate. Wages are about stationary with labor supply better and efficiency higher. We estimate present employment (Dec. 1) at about 65 to 70 per cent.

We note a slight falling off in the demand for our products. Prices are about stationary with some signs of decline. We do not expect the decline to be sudden or extensive, but in our opinion it will spread over a long period. The export field is not as promising as a year ago owing to unsettled conditions abroad and the exchange situation.

We look for a few months of comparative quiet, then, if there are not disturbing conditions abroad, we expect a fairly sudden revival of business. Many firms have accumulated funds but are afraid to use them at present. We think as soon as they realize that prices will not decline extensively except over a long period of time, they will conclude to invest. Unfortunately foreign conditions are to be reckoned with and they are uncertain. We believe this is a good ti to prepare for future investments plants and equipment, get the pla made and secure preliminary estimat with a view to act promptly as soon the revival comes, as we believe it w undoubtedly come within the comi year.

Manufacturing Stock

By F. Smith

The E. Long Manufacturing Co., Limited, Orill

THE raw material situation is impro ing almost every day. Special siz are now being placed on the mark which were almost impossible to secu one year ago. Prices are slightly reduce and, while on some particular sizes some particular kinds of raw materia such as sheets, the price has been great reduced, the average reduction in pri has been small, but the real advanta is that we can now secure this materia

Labor supply has been a big questi in the last twelve to eighteen month The supply was short of all classes men but more especially mechanics; ef ciency was low and wages were high. W are pleased to advise that we can nc secure all the mechanics or comm labor which we require at a reduction 10 per cent. of what we could hire the men for two or three months ago; in fa we have just placed a cut of appro mately 8 to 10 per cent. in our factor

We have not laid off any men on count of not having work for them to We are running at the present time about 50 per cent. stock and 50 per ce orders, and intend to continue to do We think if the manufacturers had a tle more confidence in the future a would take a little chance, that conditi would not be as bad as they are to-d It seems that if the manufacturer h not got orders to-day he will immediat lay off his men, thinking that if he bui in stock it will be necessary for him take pre-war prices. This, in our mi is impossible, and we are at least sa fied to build a certain amount of mate in stock.

We do not expect to have the mar in 1921 that we have had in 1920. market was extremely good. Price m ments in finished products for the y 1920 were always upward not downwa that is, till the last sixty days.

We have confidence that the situa will improve by March 1st, and especi not later than April 1st; in fact we lieve that it will be improved to a g extent by Feb. 1st. We have every fidence that business will be good nearly all lines in the Dominion of ada after April 1st. There is very raw material of any kind. Our cou is wealthy. We require the finished ticle of almost every kind. Our busi is not of a speculative nature. The g that is now passing over the countr a business way we think is greatly gerated and, if our manufacturers

business men would have more confidence, the gloom would not appear as serious as it is to-day. We ourselves are prepared to make a certain amount of stock, and while we expect it will be necessary to sell this stock for 10 or 15 per cent. less than the price prevailing to-day we consider it is better for us, it is better for the workmen and is better for the country at large, to manufacture this stock and, if our neighbors did the same, conditions in our country would be much better.

Country not Overstocked

By W. A. Laidlaw

Laidlaw Bale-Tie Co., Limited, Hamilton.

WITH regard to business conditions and outlook for the future, we believe it looks very good for the Canadian manufacturer and business man. There is one thing we must bear in mind, however, and that is that we must apply ourselves more efficiently than we have been doing during the last few years if we expect to compete with European labor, whose average pay is considerably less than half what American labor is now getting. We must produce more per man than the European. We believe it will be some time before the Europeans will be able to take care of their own requirements.

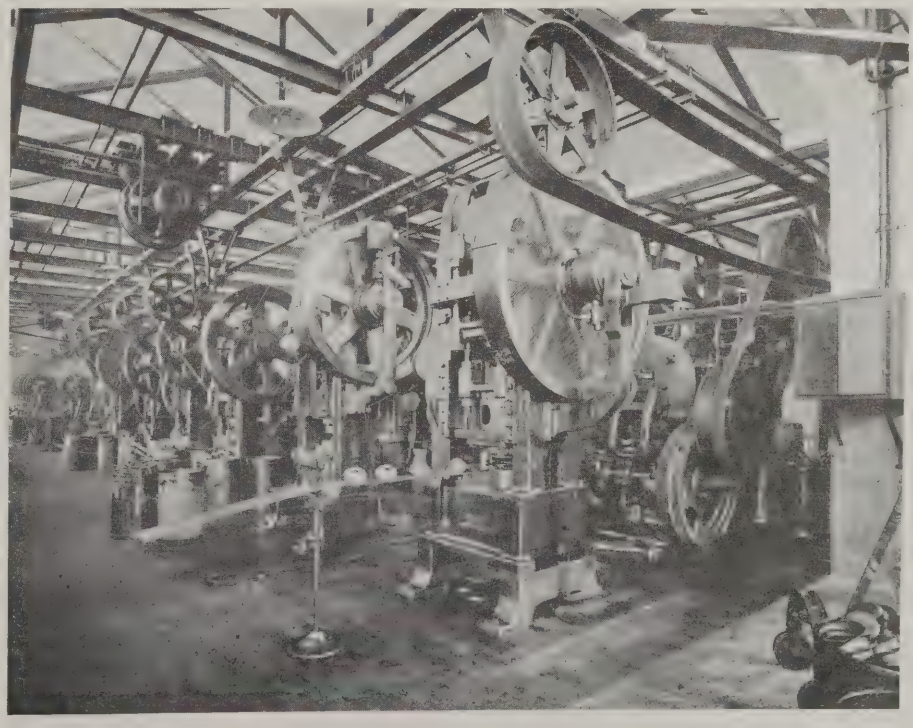
In our particular line, this period of comparative quietness has allowed us to catch up with back orders, though we admit that we are not running as full as usual, having dropped down about 10 to 15 per cent. While we have not reduced our wages we are getting more efficient service from our help and in this way have reduced our cost considerably.

During the comparatively quiet times through which we are now passing, we believe that most people are being very conservative, keeping their inventories down, buying practically only necessities and immediate requirements. Manufacturers and producers have generally kept their production down to approximate sales. This means that the country is not overstocked with goods. There appears to be plenty of money available, and the time will soon come when the buying will start again. There have been instances of exorbitant prices, though taking iron and steel as a barometer we do not believe that generally speaking they have been unduly high, especially compared with the high wages and freight which are now being paid. Until there is a surplus stock throughout the country, there is hardly likely to be any great reduction made for the next year or so at least.

While the manufacture of iron and steel has increased considerably during the last five years, we do not believe that it has increased anything like in proportion to the requirements for this class of material, taking into consideration the many uses for which iron and steel is now used.

Optimism from the Pacific Coast

By J. R. DUNCAN



Vulcan Iron Works, Limited, Vancouver

BRITISH COLUMBIA, like all other countries, is going through a period of adjustment. This had to be expected sooner or later, and the surprising thing is that the slowing down process did not come sooner. I feel that we have had too much Government control and the deferring of the evil day, so to speak, has made matters so much worse. I am not a pessimist, however, and believe that everything will work out for Canada's good, so rich in natural resources is the country and comparatively more highly developed mechanically than ever it was. We should take the advice of our bankers and men who have travelled in other countries in Canada's interests, and who genuinely believe in Canada's possibilities. This means aggressive missionary work to increase our export business, and the putting of our own raw materials into the finished product at the point of supply of the said raw material, making Canada's resources productive in labor and wealth from start to finish.

Canada is financially sound, and after travelling through Europe within the last three months, I feel that we, as a nation, have much to be grateful for. Let our optimism be that of working and watching. Delivery of materials is satisfactory and prices are gradually declining to a stage that should interest purchasers. Labor is efficient and anxious to do its part. Wages can only decline with the cost of living; volume being low we are just maintaining a nominal crew. The outlook for 1921 is satisfactory and the slightest revival would mean a gratifying state of affairs for us. The stabilizing of the lumber and pulp industries would improve our position. Prices on the finished products are declining. Deflation, to my mind, is not complete and only the pressure of natural laws will bring this about. We have made valuable connections in the Orient and our outlook, from an export standpoint, is decidedly interesting.

Speaking generally, the outlook for 1921 is by no means worse than it has been on many occasions before the war had shaken the whole fabric of business. The European situation is gradually improving. The people of the United States have elected their Government. People have not been purchasing and they must resume at an early date, which must necessarily mean work. Work means wages; fair wages mean contentment.

Speaking specifically of British Columbia, both the Dominion and Provincial Governments have many important works to go on with, works which will become an asset not only to this Province but to the Dominion, so I say, "Here's to 1921."

General Conditions in Iron and Steel Industry

By A. WHYTE

Vice-President, Canadian Car & Foundry Co., Limited, Montreal

UNTIL a few months ago, manufacturers in Canada experienced great difficulty in obtaining raw materials. At the date of this memorandum, however, this condition has completely changed and prompt deliveries can now be obtained; in fact the majority of producers of raw materials have considerably curtailed their output. Trend of prices has been downward and on some items there have been very substantial reductions, although the important reductions have not been in respect to essential items.

During the early part of 1920, the supply of labor was not in all cases sufficient to meet the demand, but during the middle and latter part of the year no difficulty was experienced in securing a satisfactory supply of labor and the available supply is now considerably in excess of the demand in so far as our particular trade is concerned. Efficiency has increased during 1920 to a marked degree. During the early part of the year while labor was scarce, there were indications of an energetic endeavor on the part of labor organizations to diminish output and increase rates. During the latter part of the year conditions improved and we now think that all classes of labor realize that the peak has been reached in the matter of rates and that there is necessity for a greater output and more efficiency to justify the rates now in force. During 1920 our labor rates were advanced about 10 per cent. over rates governing during 1919.

At the present time we are working what might be considered a normal force at practically all our plants, and this condition, we expect, will govern until the early part of 1921, when it will probably be necessary to make a very considerable reduction in the number of employees in our various works.

During 1920, there was an energetic demand for all iron and steel products and in our particular line of trade a large volume of business was booked, but owing to the labor troubles in the American steel trade, which, together with railroad embargoes and shortage of freight equipment, resulted in serious congestion of all steel mills, the manufacturers of iron and steel products in Canada were unable to turn out a large part of orders booked, so that a considerable volume of business will be carried forward into next year.

Price movements in finished products advanced materially during the year owing to the increased cost of material and labor.

In so far as our particular trade is concerned, very little progress has been made toward deflation. The prices of essential raw materials remain practically unaltered, while labor rates are still at the peak, and so long as these conditions remain, there can be no reduction in the selling price of our commodities. Steel is the most essential raw material in our line of business and the prices established by the United States Steel Corporation have not been changed, the only deflation being in respect to those premium prices established by the independent steel companies during 1920, but now removed in view of the curtailment of their output.

Buyers are undoubtedly holding off with a view to getting lower prices in the new year, but it is very difficult to say just how far prices will decline in view of the fact that there must be a large supply of high-priced materials in the hands of various manufacturers the premium on which will have to be absorbed by the manufacturer or the buyer.

Developments in the export field have not been satisfactory, the principal difficulties being the adverse exchange rates and the impossibility of granting credits to foreign nations. If the Canadian Government insists that credits cannot be established, a foreign financial corporation should be organized having as its stockholders the leading manufacturing concerns of Canada, with the object of developing export business and the creation of longer credits than can be granted by independent concerns. The possibility of such an organization will have to be considered in conjunction with the exchange question as the latter is a serious handicap to Canadian manufacturers when attempting to obtain business either in Europe, the British Colonies, or other countries where the Canadian dollar is at a premium.

We think there is no reason why 1921 should not be a prosperous year for Canada. The prospect of increased immigration is particularly bright and this should result in increased production in those commodities which Canada can profitably export in competition with other countries. Labor conditions should be more satisfactory than in 1920, and a decrease in the price of raw materials should undoubtedly result in the placing of a lot of business which is being held up at the present time. So far as the iron and steel trades are concerned the future is encouraging in view of the admitted shortage of equipment of all kinds on the Canadian railways. Fin-

ial conditions may delay the placing of orders for a time, but it is felt that within the next two or three months, these obstacles will be removed.

Steady Demand During Year

By G. E. Newill

Robb Engineering Works, Limited, Amherst.

LABOR has advanced in all departments during the past year to the extent of approximately 15 per cent. We are working eight hours per day, and forty-eight hours per week. We experienced a serious strike in the foundry department in June lasting some six weeks, due to a demand on the part of the moulders and coremakers for higher wages. An agreement was finally reached by compromise.

We have recently introduced a premium system in our machine shop and foundry with marked success and which has resulted, in many cases, in an extraordinarily increased production per man.

During the year we have experienced considerable difficulty in procuring early shipment of materials, including boiler plate, steel castings, bar steel, etc., but this condition is now completely reversed.

During the fall we completed and shipped, two 2,500 h.p. marine engines ordered by the Halifax Shipyards, Limited, to be installed in the *Canadian Mariner*, and the *Canadian Explorer*, eight thousand three hundred and ninety ton steel cargo steamships for the Canadian Government Merchant Marine. The former has passed her official steam trials, the engines making an enviable record.

We have had a steady demand for mill engines, boilers, etc., during the year, but due to the recent depression in the lumber business our output has now been materially reduced.

The boiler shop has been fully occupied and we have turned out a large number of water tube and return tubular boilers. We have recently introduced our "Victory" water tube heating boiler, ranging in size from 20,180 h.p., which has met with most marked success, and a considerable number are already in steady operation.

Our tractor department has been fully occupied up to date and we have shipped or practically completed some one hundred and fifty machines. We find a steady and increasing demand in the Western provinces for this type of tractor. We have, however, been obliged to curtail our spring schedule pending the report of the Tariff Commission and more settled monetary conditions.

We are endeavoring to introduce further lines for manufacture, as our available plant is not yet fully occupied. We are looking forward to increased demands for our products early in the new year.

A General Review of Iron and Steel Industry

By ARCH. McCOLL

Nova Scotia Steel & Coal Co., Limited, New Glasgow

IN our business, as miners of coal and ores, and manufacturers of steel and its products, the source of our raw material is largely within our own properties; and, consequently, we are not dependent for our supplies on outside markets, and our supply of raw material is therefore in a much more stable condition than that of any other manufacturing concerns. The high wages that have prevailed during the past few years have necessarily increased the cost of our raw material, and while so far there have been no distinct reductions in wages, the general trend at the present time appears to be downward.

During the year we have had a plentiful supply of labor, and, on the whole in our manufacturing operations, the efficiency of the labor employed compares favorably with the past few years. In the early part of the year, we gave an advance to all our employees both in the collieries and the steel works. A recent advance of very large dimensions was recommended by a Royal Commission for all colliery employees, to become effective on July 1, 1920. The negotiations regarding this award are well-known to the public. A compromise of about one-half the original amount recommended by the Royal Commission was agreed upon in November by representatives of the operators and the United Mine Workers. The new agreement was, after a series of acrimonious discussions between rival union leaders, accepted by the miners by a large majority. During the greater part of the year, the efficiency of the men in coal mines has been below the average, but in the past two months there has been a very material improvement in this respect.

Employment in the colliery has been steady and active for the whole year, and in our rolling mills, forges, and car works we have been running well up to capacity. Our blast furnace and open hearth plant have been closed down since the middle of November.

We had an active market for all our products during the whole of 1920, although, for the last two months, the demand has fallen off somewhat, for finished iron and steel. The price of finished products which was somewhat low in January and February, advanced, owing to the demands of the export trade, and reached its peak in July; since that date there has been no serious drop in the prices in Canada, but the decline in the price of steel products, which has taken place in United States, has had the effect of curtailing purchases. Compared with the prices asked by the American steelmakers Canadian prices were at all times during the summer favorable to the purchaser.

It is difficult to say how far the process of deflation has been completed, the increased cost of coal and labor, which are the two large items entering into the cost of steel, are likely to continue for some time in the future. For these reasons, and especially as the price of steel products at no time reached the inflated rates of most other commodities, we feel that there will be no further considerable drop in steel prices.

During the past year, our company developed very considerable export trade in steel billets, the slackened demand in Britain caused by the coal strike has somewhat curtailed this business for the time being, but it is hoped that with the lower ocean freight rates the future may see an expansion in this business.

While at the moment buyers of all classes of steel products are holding off in anticipation of lower prices, we feel this slackening of demand will be but temporary. Under normal conditions the principal consumers of steel are the railways, bridge and structural workers, and manufacturers of machinery. For the past six years the consumption of steel in all these lines of industry has been very much below normal. As soon, therefore, as the consumer decides that prices have reached a permanent level, there is little doubt that operations that have been curtailed during the war period will again assume former dimensions. Without doubt the resources of Canada, particularly the financial resources, have increased enormously in the past decade and it simply remains for a restoration of confidence in the country's future to bring about a revival in business which once under way will, without doubt, soon reach astonishing proportions.

Fair Demand for Steel

By W. J. McKay

Dominion Iron and Steel Co., Ltd., Montreal.

AS far as the steel trade is concerned we feel that it will be the first to benefit from the credit situation when money gets easier, which is expected in the early spring.

Although the mill and warehouse stocks of some finished and unfinished steel products are now depleted and the outlook is that the mills will have sufficient heavy tonnage to tide them over operating at a fair capacity until about the second quarter of next year, we feel that there will be then quite a fair demand for the semi-finished product.

The steel situation to us looks better and brighter than any of the other trades and it is just a matter of sitting tight for another month or so.

CORE MAKING.

FARM IMPLEMENTS

General Review of Agricultural Implement Industry

By ARTHUR W. WHITE

The George White & Sons Co., Limited, London

THE large farm machinery trade in Canada, viz., steam and gas tractors, threshing machinery, clover hullers, bean threshers, etc., has enjoyed a very prosperous year owing to a good average crop throughout Canada. A good crop throughout Canada in the past has always meant a prosperous year for manufacturers of large farm machinery. The present unsettled period brings about a new situation. All manufacturers are now working on machinery for next harvest, using high-priced raw material and paying high wages. The sales season will not start until next spring. What the outcome is going to be is not easily foreseen.

Raw materials have taken a heavy slump. There are large stocks in the United States which are being offered for resale very much below manufacturers' prices, and particularly below the Canadian manufacturers' prices. This is being taken advantage of by Canadian manufacturers using such raw materials. In a number of cases different steel and iron commodities can be purchased in the United States, the exchange and duty paid on them, and laid down here 20 to 30 per cent. lower than the Canadian manufacturers' prices. This, no doubt, will right itself in time, but in the meantime, where any manufacturer has to face a low selling market and has stock of high-priced raw material and is paying high wages, he is going to take advantage of every offer of low prices in making his purchases.

So far there does not appear to be any great reduction in wages, although this is bound to follow the deflation in other lines. It would make for better conditions if employers could continue to pay, if not the present rate of wages, within 10 per cent. of the present rate, until the spring at least, pointing out to the employees that to obtain these wages it is necessary for them to give production.

To make any attempt to forecast the extent or period of the present deflation is impossible, but until large inventories in the United States have been liquidated, there can be no hope of any check in the downward trend of prices.

In the United States there appears to be a feeling of despondency and blue ruin. We in Canada are not affected to the same extent, or as quickly, and if the Canadian manufacturers can carry on and keep men at work at a reasonable wage until times right themselves, it will inspire a confidence throughout the country that will help to carry it over the unsettled period.

In the large farm machinery manufacturing industry the question of tariff is a "nightmare." Nearly all manufacturers are buying their gas tractors in the United States, and will continue to do so until the duty is reinstated. The Order in Council taking the duty off was passed as a war measure, the Government giving the manufacturers positive assurance that it would be rescinded at the end the war. The industry was just starti in Canada when the duty was removed two or three companies were buildi and a number of others assembling a starting to build gas tractors. If it h not been found necessary to take the du off tractors as a war measure, or ev if the Order in Council had been scinded after the war as promised by t Government, millions of dollars' wor of gas tractors would now be made Canada, giving employment to thousan of men. The fact that Canadian man facturers have been purchasing tracto in the United States and utilizing the organization and sales force to dispo of them in Canada proves conclusive that the Canadian manufacturer cann compete with the large specialized indu tries in the U.S., particularly when t Canadian manufacturer has to pay du on his raw material.

This also applies to threshing machin and other large farm machinery, and t future of the industry depends ver largely on the report of the prese Tariff Commission and the action of t Government on the report.

The farm machinery industry shou flourish in Canada. We have a good hom market, and the possibilities of an e port market are enormous, but unless t manufacturers can have some confiden in a stabilization of the tariff, the indu try, instead of advancing as it shoul will retrograde and manufacturers, they continue in business, will increas their purchases of the manufacture goods in the United States using thei organizations to dispose of them i Canada, or move to the United State to build the machinery, and ship int Canada.

Improvement Expected

By J. E. Ruby

The Frost and Wood, Co., Limited, Smith's Fall

FARMERS are placing orders ver sparingly for their implement r quirements next season, in marked co trast to conditions a year ago when the were ordering well in advance of requir ments. We anticipate, however, tha when the season comes round for the us of farm machinery, there will be a fai demand, and we are, therefore, manu facturing up to about 75 per cent. 1920 sales; farm machinery having las year been in good demand throughou Canada.

Raw materials, largely iron and ste products, are becoming somewhat easie to obtain, but there has been as yet n marked decline in prices; in fact mate ials coming into the plant now were pu chased under contract months ago prices, in most cases, higher than durin the war period and with one or two e ceptions, such as harvester duck, pric at to-day's market are little, if any, low than those at which we had contracte All our regular mechanics are fully em ployed though there has been some r

duction in unskilled labor of which there is a surplus available.

Export trade showed a marked falling off a year ago, and the condition has not improved, but has if anything become somewhat worse. Stringent credit restrictions imposed either by the Governments or by the banks in most European countries, including Australia, has further limited the purchasing power of foreign importers and very little foreign business need be anticipated until conditions in this respect change.

While we look for further price recessions, it is our opinion that the worst of the deflation in prices has been passed, and that within the next few months a steady improvement will take place in trade conditions in Canada. Despite lower prices which are being obtained for farm products as compared with last season, the increased yields will largely offset the decreased prices obtained. When farmers are satisfied that a fair price limit has been established, considerable buying will follow.

Volume was Greater

By E. N. Ward

The Canadian Rumely Co., Ltd., Toronto.

WE still devote our entire time to general jobbing work, and from our experience in this line, over a period of five years, the price of raw materials has been the highest we have ever paid, and the supply has been the most limited. We do, however, find that during the past thirty days (December 1), there has been a slight dropping off in the prices, and that the supply is greater. We have also noted a marked improvement in the efficiency of labor during the past year. For several months past, we have had no difficulty whatever in obtaining help and a good grade of help.

Our volume of jobbing business has been greater in 1920 than it was in 1919, and it is our opinion that the process of readjustment which we are now passing through will possibly last until Spring of 1921, and at that time, we look for an increased volume of work, as we do not believe the present depression is due to overproduction but rather to a feeling on everybody's part that prices are to be lower.

Away to a Good Start

By W. J. Bathgate

Percival Plow & Stove Co., Limited, Merrickville.

WHILE the price of raw material we use is still high, deliveries are prompt, which is something we have not had for the past few years. We had no difficulty securing all the help we needed, at an average efficiency, at a slight increase in wages over 1919. Being located in a village our employees are what you might term a happy family and any grievance is promptly adjusted and outside labor troubles do not affect us.

The market for our goods in 1920 was the best in our history. There has been practically no change in the price of our finished product. The material used in the manufacture of our product, namely, steel, iron and lumber with coal and coke, has not changed in price to any extent, and until there is a reduction in the prices on these commodities, we cannot lower the price on the finished product.

The orders we are receiving now for spring shipments indicate that we are away to a good start and inspire us with the confidence that in spite of the abnormal conditions 1921 will be a successful year.

Running Full Pressure

By an Implement Manufacturer

THE trend of prices on raw material at the present time is downward. This is true especially in the United States. The iron and steel industries in Canada have not as yet made a move, although they are considering same. The prices on lumber in the United States were very high and the drop has been considerable, more marked than in any other line.

The supply of labor during 1920 was not sufficient to meet the demand until the fall season. At the present time there seems to be sufficient. Wages have not as yet been reduced. During the scarcity, labor, generally speaking, was very independent. You were practically compelled to accept what was given you for wages paid, which are very high. Since the change from scarcity to sufficiency to meet the need, labor has rendered better and more efficient service, recognizing that the changed conditions meant that they must play fair.

Our factory is running under full pressure of forty-eight hours per week at the present time. Whether this will continue will depend upon the buying attitude of the farmers for 1921. This will be known with the advent of the New Year, and whatever the facts are, will determine our future policy.

The manufacturers in our line are loaded with high-priced materials bought in anticipation of a large business for 1921, and based on the agricultural prosperity of the country for 1920. If costs are a basis of price, and they have always been so in our industry, the price movement will not be down until these high-priced stocks have been reduced. This, however, will depend somewhat upon the attitude of competition, which will have to be met, no matter what the results. The prices of our product should be at least fifteen per cent. higher than those of 1921.

The export business is not very promising at the present time on account of exchange. The buying will be very limited. On account of this it is very essential that the requirements of the home market be taken care of by Canadian manufacturers, and until normal conditions practically prevail.

I do not think there is any call for pessimism. The success of agriculture during the past year does not warrant a feeling of this kind. The falling prices, however, for products of the farm will be sure to create a depression, especially with the farming community. This reflects itself in curtailed buying, which reacts all along the line. This country, however, will have to get back to normal and in the process conditions like this will be felt. The only thing to be hoped for is that the slipping back to normal will be gradual. One of the greatest factors in minimizing the effects of returning to normal would be for each one to do the right thing to others. If there has been any profiteering or injustice in the past, quit it. Let our motto be—"Be just"—this not only to apply to capital, but labor.

Advises Marking Time

By A. Stanley Jones

A. Stanley Jones Co., Limited, Saskatoon.

AT the present time our raw materials are still at their highest point. Wages have been at the highest point during 1920, efficiency has been medium, and supply has been ample. In November we reduced wages and are gradually working down to the basis of wages at the beginning of 1920. We anticipate reaching this point in January, 1921.

We are reducing the number of employees on account of anticipated slow buying, short buying, and possibly because we may have to sell on a low market, having bought material at a high point. We, therefore, consider that next season should be one where manufacturers, where possible, should simply mark time and not do a thing more than is necessary to uphold what business they must keep control of.

Demand for our goods in 1920 was the best that we ever had. Price movements do not vary. The process of deflation is by no means complete yet.

Our outlook for 1921 is as follows: We figure that buying on the high market we would do well to buy only what is absolutely necessary. Farmers have not been satisfied with the present prices realized on grain and will be very slow buyers, buying only what is absolutely necessary. On top of this there is no doubt that there will be numbers of people who will be only too anxious to liquidate in any shape or form the stock on hand, which may lead to reducing prices below what they should be. Consequently, those firms that can hold on and not have to cut prices should mark time as much as possible during the coming season.

The Dryden Paper Company's excess of is announced. amount to approximately liquid assets over current liabilities, it $2,250,000, nearly all of which is in cash. The only contracts for new construction, which have been made so far, amount to less than $200,000 and are to cover necessary work in the present plant, which will add substantially to the sulphate output.

Conditions in Tractor Industry

By F. R. BARTLETT

Chase Tractors Corporation Limited, Toronto

IN our industry there is no difficulty in connection with the supplies of all our raw material and the price trends are, without question, downward.

The supply of labor has never affected us to any great extent here as we have always been able to procure what we required. There has been a marked increase in the efficiency of the men in the last six months and, as elsewhere, a general lowering of labor rates.

At the present time we are on a very reduced scale of production, due to general conditions that have prevailed through the latter part of 1920. The general dropping off of the buying public and the general slowness in the movement of the wheat in the West, we feel were factors in this connection.

The demand for our product was very good in the spring but did not come up to our expectations during the fall. This was due largely, in our opinion, to the general downward trend of prices about that time and, when some of the large automobile concerns advertised a decrease in prices of their output, it had the effect of the farmers putting off buying temporarily to see what the decrease in the implements would be, as they all expected prices were due for a drop. This, combined with the slowness of the crop movement, carried on pretty well to the freeze-up, when the demand practically ceased and all arrangements then made were contracts for 1921.

In connection with the tractor industry, there have been a few decreases in prices, but this, in our opinion, was more for the effect of getting rid of surplus stock than any justification in the drop in tractor prices. This all came about, more or less, as the result of the decreases in prices published by the large automobile and truck manufacturers. There is no doubt that there was considerable price inflation and this has been squeezed out in order to stimulate demand and to keep together factory organizations. There is no question that the normal price now will be considerably higher than 1914, due to the fact that the cost of labor and material is considerably in advance of the figure for that year, and as long as the wages of the basic industries remain as they are, prices in our lines will naturally remain about the same.

The general information that is available in connection with tractor prices cannot point to other than the fact that in the main, and on the average, tractor prices are not coming down as, in our opinion, the prices on tractors were not inflated, as in the case of the automobile.

In connection with the export field, the indications are that 1921 will be a remarkably good year in our industry and the prospects look much better for 1921 than they did for 1920. There are numbers of factors, of course, which govern this, and all we have to go on now are the appearances. The next sixty days ought to tell the tale, as by that time the contracts for 1921 deliveries ought to be pretty well all signed up.

The outlook for 1921 is remarkably good and tractor manufacturers will base their production largely on the orders for spring deliveries. I do not think there is any question but that there are not going to be enough tractors of all kinds to go around and everything points to a record spring business. In all probability there are a certain number of dealers and others who are waiting for a slump in tractor prices, but a full investigation of the situation shows that tractor prices are about as low as they can go. When this finally comes home to those interested there will be a very large demand for this class of product, and as the general buying public have been hanging back now for some months, their purchasing power will, in our opinion, reach a large volume when it comes through.

The Jewelry Industry

By Geo. H. Lees

George H. Lees & Co., Ltd., Hamilton.

THE year just closed has been most remarkable for the sudden change in business conditions. Beginning with January the year continued, month after month, to excel all previous records until in May, when the luxury tax was imposed, business fell with a sickening thud, and up to date has not recovered its equilibrium.

Our chief material, gold, is usually not subject to variation in price, but since it has to be largely imported from the United States, the price now is increased to the extent of the exchange. The next important material is silver, and this has fallen to nearly half of the price that ruled at the beginning of the year, and our other important material, precious stones, is showing a downward tendency, though not yet to a very large extent.

In the early part of the year there was a scarcity of skilled labor, but in the last six months there was not much trouble in that respect. In the matter of efficiency, however, it is but fair to say that at no time did we find our employees falling down on their output per man, as was reported to be the case in some of the industries.

In the middle of the year, not realizing that the falling off in volume of trade would be of so long duration, we continued manufacturing until we were overstocked, with the result that it was unnecessary to work the customary overtime in October, November and December.

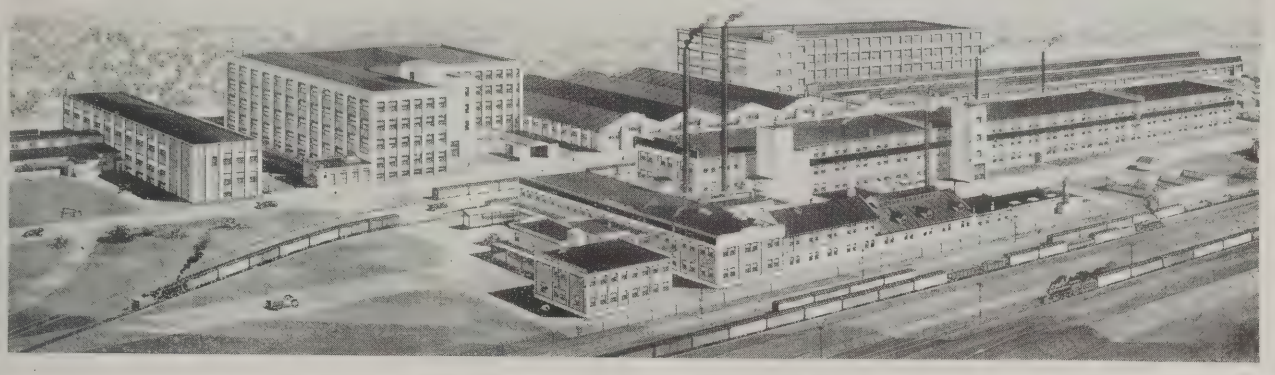
The prices of jewelry have not fallen materially, and cannot do so, as possibly no other business was as conservative in its increases as was the jewelry trade, which was largely accounted for as referred to above by the permanent price of gold, and unless there is a reduction in wages that we do not at present anticipate, there cannot be any large reduction in jewelry prices.

We are unable to prophesy whether or not we have reached the end of the deflation process, but, unless the luxury tax is removed, we do not look for any greatly improved conditions for a long time to come, but we feel sure enough of our ground to prophesy that if the luxury tax were removed, business in the jewelry line, and in all others, would at once experience a decided improvement, and business generally would gradually regain its normal swing, though perhaps for a year or so it would not reach the rather abnormal rush of the latter part of 1919 and the early part of 1920.

Have Little Anxiety

By F. E. Mutton

International Business Machines Co., Ltd., Toronto.



COMPARED with last year, the difficulty in securing raw material is gradually decreasing, and the cost of raw material is also being gradually reduced.

Labor conditions show a splendid improvement. We recently culled out our factory organization by twenty per cent., eliminating the less efficient. This did not affect our production by anything like twenty per cent. We do not expect it to affect production more than five per cent. We are securing a better quality of labor, but have made no change in operating hours.

The 1920 output shows an increase of about 32 per cent. over 1919. We have advanced the selling price of our product in proportion to the increased cost of production.

We have very little anxiety as to the prospects for 1921, feeling rather confident that by the turn of the year business conditions will greatly improve. We are quite strongly of the opinion that retail dealers, jobbers and wholesalers are understocked, except in a few rare instances. This we consider is a good indication, showing cautious buying, looking for the fall in prices. It further means that the necessary commodities consumed by the public must produce before long increased buying.

Collections have been easier this year than in 1919 up until about a month ago (November 1), when we noticed a slight increase in resistance. We have also recently found a resistance as to the buying power of the public. Right here, however, we would like to emphasize the word "recently." Up to a month ago it has been better than ever. The future is naturally somewhat uncertain as to what the buying public will do.

OUTLOOK FOR THE AUTOMOTIVE INDUSTRIES

May be Actual Scarcity

By T. A. Russell

Willys-Overland, Limited, Toronto.

IT is more difficult than usual to forecast developments of the next few months, owing to the very general character of the present business disturbance. During the first six months of this year, material of almost all kinds was high in price and extremely difficult to obtain. During the past six months, contrary conditions have prevailed, and it has been almost equally difficult to find a market for the finished product of different manufacturers. This, of course, has had its effect on the labor market, because the slowing up of purchasing has necessarily caused a shortening of working hours, and a reduction of working forces. A considerable number of men have been thrown out of employment, and many others are working only partial time.

Generally speaking, this has not as yet broadly affected wages, but it is bound to do so if the price of the goods which labor produces is to be lower, and if, at the same time, the goods it consumes are also lower. There has been a greater indication of the desire of workmen generally to increase their efficiency and output, and many experiences have occurred where a reduction of force of considerable size was made without in any way interfering with output.

In the motor car business the demand has been constant and in excess of supply during the first half of the year. During the last half, on the other hand, the demand has slackened off greatly, and there has been a marked reduction in sales. Those in the industry attribute a small share of the responsibility in this to the Government's policy in arbitrarily increasing the taxation on motor cars, in May last, from ten per cent. to seventeen per cent. and twenty-two per cent.

It has been estimated that in Canada there were over 7,000 hands directly engaged in the manufacture of motor cars, and over 10,000 engaged in the manufacture of parts and accessories, in the first half of this year, who are now out of employment in these industries.

There has been some reduction of prices, with a view to stimulating demand, and the general feeling is that this has gone as far as it can, under present prices for materials and labor.

The motor car is now used so much for business purposes, that a survey recently taken indicated that seventy per cent. of the cars in use were business vehicles. This gives the motor car industry a confidence in its future, and manufacturers generally are looking forward to a gradually improving demand after the first of the year.

There has also been a decided check on production in the last six months, and it takes so long to get under full production, when a break has been made, that quite a few keen observers expect to see an actual scarcity of motor cars during the months of March, April and May.

Brisk Revival Soon

By Wm. M. Gray

Vice-President, Gray-Dort Motors, Limited, Chatham.

THERE is a vast difference in industrial conditions as they existed in January, 1920, and as they are found today. This change has perhaps been more marked in the automobile industry than in any other. During the first six months of 1920 the demand for automobiles in general was very brisk, in our own case being extremely satisfactory. In July, however, the slackening of demand made itself felt throughout the whole industry.

As in 1919 raw materials and accessories were high priced and difficult to obtain—due to strikes in the steel and coal trades. With the curtailment of production, however, the raw material market became slightly easier.

At the beginning of 1920 skilled men —while more plentiful than in the preceding year—were high-priced and rather difficult to obtain. Now, because of curtailed production, estimated at almost 60 per cent., labor is ample. Men are anxious to obtain positions, and are more considerate of the quality of work they turn out. This condition will have a beneficial effect on production, enabling manufacturers to weed out indifferent labor and give full scope to capable, efficient workers.

The present curtailed production, coupled with the usual inactivity during the winter months, has created a material reduction in all staffs. There are strong indications, however, that the industry will pick up again in the spring, with a consequent resumption in the demand for labor.

We believe that the bottom in price movements has been practically reached, as motor car manufacturers, on the whole, have taken their loss on their inventories. If the present indications for a boom in the spring materialize, further price concessions will be checked. The market may sag slightly during the summer, but after that we can look for a long, steady climb.

The process of deflation in the finished product, so far as we can see, is practically completed. Raw materials have yet to share in the reductions, because manufacturers—as we stated

above—have largely taken their losses on their inventories instead of from the raw materials where such losses properly belong. So far as we can see, any further reductions will be small and extended over long periods.

So far as we are concerned, the outlook for the 1921 market is very favorable. Our sales connections throughout the country report excellent prospects. But whether this condition is a feature of the automobile trade in general, we are unable to state.

We believe, however, that anyone who makes a study of conditions throughout Canada will have confidence that there will be a brisk revival of industrial activity within a few months. Fundamentally, Canada is an agricultural country. And the 1920 crop was perhaps the largest we have had in the past six years. There is, therefore, a great deal of potential wealth in the country, even though a large part of our grain has not yet been exported.

Repeat 1920 Record

By an Automobile Manufacturer

WE have no trouble now in procuring all the parts and material which we require. Prices are being reduced. We can procure all the labor we require now, although this was somewhat of a problem earlier in the year before the depression came. Wages being paid were abnormally high, but we have now greatly reduced them. We are operating on short time and have greatly reduced our operating forces.

We had a splendid market for our automobiles during 1920. Our sales in Canada were increased about 25 per cent. over 1919.

In the writer's opinion the process of deflation has not been completed. I think there is a tendency on the part of some manufacturers, merchants and others to refrain from taking a loss and so liquidate their high-priced goods. The writer feels that that is one of the situations that is holding back a return to normal times. I think everyone should be willing to make a sacrifice of profits at a time like this in order to get business re-adjusted to a reasonable basis.

The export business has fallen off and the present situation is admittedly bad. The depression and time of readjustment are world-wide. Our cars are sold payable in U.S. funds, which funds are, of course, at a premium all over the world.

The outlook for 1921, so far as our export business is concerned, is not bright. We shall consider ourselves fortunate if we can export as many cars as in 1920. The writer thinks that it is very doubtful that we shall do so. With reference to the domestic or Canadian business, the writer feels that we shall repeat our 1920 record. We feel that Canada is conservative and sane and that by spring, at least, the period of depression and adjustments will have been passed. We simply have that optimistic confidence that Canadian business will return to a normal basis some time during the first six months of 1921.

Optimistic as to Outlook

By W. B. McLean

Mapleleaf Manufacturing Co., Limited, Montreal.

AT present we find our raw materials easy to get and prices stationary or slightly downward. We anticipate some further slight cuts but do not anticipate that prices will be finally lower in the spring of 1921 than they were in the spring of 1920.

There is an ample supply of labor at present owing to the general slackness in industry. Efficiency is not yet up to a pre-war standard and wages continue high. At present we estimate that our industry is employing only about 35% of normal staff.

The market for our goods was good for first half of 1920, but has greatly slackened off since, principally owing to the slowing down of business among our buyers. The fundamental demand for trucks is still strong and increasing as shown by inquiries, but there is a general tendency to withhold orders until conditions are more settled. We do not anticipate any further reductions in the price of our goods until labor costs come down substantially, in sympathy with a generally reduced cost of living.

There have been an increasing number of inquiries for export business and some orders from British possessions, and prospects in this line are good.

We are optimistic as to the outlook for 1921 after the first quarter, as we know that the demand for trucks is increasing from day to day. Fundamental conditions are good, and there has been no overproduction. All that is required is a restoration of confidence as to stability of conditions.

Recovery Should be Quick

By A. M. Kerr

The Four Wheel Drive Auto Co., Kitchener.

THE supply of raw material appears to be more plentiful, but the price does not show any very great drop. We had no trouble in securing all the help we wanted during the last half of the present year. The efficiency has been greater during the last half of this year and there has been no change in the wages paid up to the present time.

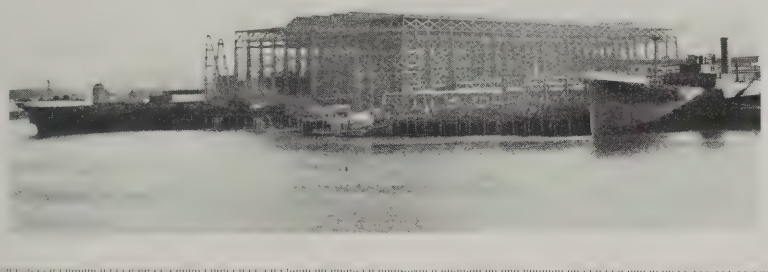
The market for our goods during the first eight (8) months of the year was very good. The last two months have been very quiet. There has been no change in the price of the finished article. There has been no inflation of prices on our product, therefore there has been no deflation.

As far as we can see from this distance the outlook for 1921 is promising. We look forward to a lot of building, contracting and road-making, which would naturally present a good market for our truck. There is no question that with the present slow-down in industry the readjustment, which is bound to come, will be here so much quicker, and when goods already in stock, bought at high prices, are sold out there will be a ready buying, no doubt, of new goods at the greatly reduced prices offered in some lines. It is our humble opinion that 1921 should be a year not of extraordinary expansion, but of very material prosperity.

Trucks in Demand

By Jas. L. Acker

National Steel Car Corporation, Ltd., Hamilton.



WE look forward to excellent business in 1921. Our production will be increased, but we anticipate no difficulty in disposing of our additional output. Inquiries and orders keep coming in and everything indicates that the country's buying power is more than sufficient to take care of the products of Canadian truck manufacturers in 1921. Of course factors like a protective tariff and the carrying out of the good roads programme will be of material assistance to the manufacturers.

The prices of National trucks have not been reduced and no reductions are contemplated. In the last three years the price of National trucks has only advanced 15 per cent. on an average—this in spite of a much greater advance in raw materials.

The prices of raw materials continue steady. There is no material reduction but the supply is beginning to catch up with the demand. The price of labor, too, has not been reduced. Good mechanics are still hard to obtain, but there seems to be plenty of unskilled labor on the market. Our plant has been running to full capacity, so there has been no lay-offs or unemployment.

We are closing one of the best years in our history. We have been unable to keep up with the demand for Canadian trucks. For this reason we have made no progress in the export field. The home market has taken our entire output.

Replying briefly to a series of questions on the automobile manufacturing industry, George W. Parks, president Maxwell Motor Company of Canada, Limited, states that the supply of raw materials during 1920 was ample with price trends downward. The labor supply has been ample, though lacking in efficiency and highly paid. At present there is a willingness on the part of labor to conform to readjusting conditions. The market for automobiles has passed from normal to sub-normal to a shut-down. Prices have moved downward. The outlook for 1921 is good. Both efficiency of labor and quality of product are improving.

SHIPBUILDING INDUSTRY

General Review of the Industry

By A. R. GILLHAM

Managing Director, Canadian Vickers Limited, Montreal

DURING the past year the supply of materials, especially steel, was considerably handicapped by the labor troubles in the States in the railroad and mining industries, but this condition has much improved in the past few months. The tendency now as regards prices is downwards in practically all commodities. The supply of materials is distinctly good and promises to improve.

There is an ample supply of labor and its efficiency has shown a steady improvement, although the wages, which gradually increased during the past years to meet the increased cost of living, will remain at a high figure. In this connection it is confidently hoped that as the cost of living improves the saner elements in labor will be able to guide their less-informed brothers, realizing that a reduction in labor costs is essential if business is to be obtained in competition with European countries.

In the shipbuilding industry there is a serious falling off in the number of employees, due to lack of orders for 1921. The cause of this is the adverse exchange rate and the fact that the Canadian Government shipbuilding programme has come to an end. There is no market in the United States for Canadian-built ships due to the financial inducements offered by the United States Government to United States owners to build their vessels in the States. The consequence is that the only market for Canadian shipbuilding at present is Europe and, as stated above, the exchange rate is insufficiently high to prevent business.

With the reduction in prices of materials and increasing efficiency of labor, prices asked for in Canada for ships are steadily coming down, and it is confidently predicted that, with the further reductions both in wages and materials, anticipated in the near future, such prices will be so reduced as to enable Canada, apart from the exchange question, to compete to advantage in the open markets of the world. This is the only feature which justifies the hope that, as exchange becomes normal, there will continue to be a limited shipbuilding industry in Canada which can operate on a commercially sound basis.

It should be noted in this connection that the cost of construction of ships in Canada is not materially higher than the present cost in England when the exchange situation is left out of account, although it must not be forgotten that there will undoubtedly be a tendency towards cheaper production in England when labor conditions there become more settled, although there is no likelihood of wages in Great Britain ever being reduced to the pre-war rates.

It is worthy of note that, roughly speaking, 50 per cent. of the business of Canadian Vickers, Limited, in shipbuilding has been for export, and the performances of ships built by them for foreign countries has more than justified the confidence in the ability of Canadian workmen and Canadian shipbuilders to turn out ships in all respects equal to those of any other country.

The outlook for 1921 is not bright at present, so far as shipbuilding is concerned, but the basic factors, namely, efficiency of labor, the drop in price of materials, and the recognition by labor of the economic situation and willingness on their part to co-operate to overcome the adverse features, are such that a pessimistic cessation of effort to overcome these difficulties and to tide over the dull period is not justified, but a more vigorous attempt is necessary on the part of the Government and employers towards finding means by which the industry may be kept alive until exchange becomes more normal and the Canadian shipbuilding industry has a real chance to continue on its own merits.

In conclusion, in our opinion the present situation of the shipbuilding industry is such that, provided the difficulty of exchange which, after all, is an abnormal one due to the war, can be overcome by means of assistance from the Government or otherwise, there is every reason to believe that shipbuilding in Canada can continue as a profitable commercial business.

Supplies Come Easier

By Levy McMillan

Nova Scotia Steel & Coal Co., Limited, New Glasgow.

THERE is little difficulty in obtaining supplies of all kinds for shipbuilding purposes at present and for the last year, as compared with the previous four or five years. This is especially true of the supply of ship's plate—one of the largest items entering into the construction of a ship—since the plate mill at Sydney has been in operation. The plates from this mill are of excellent quality and deliveries are prompt. As a matter of fact, all material, fittings and furnishings, supplied to the shipbuilder by Canadian manufacturers are of good quality to-day. The trend of prices is downward and will likely continue so for some time. Unfortunately for the shipbuilder, the demand and price of tonnage for the moment has fallen much more sharply than the price of the material entering into the ship.

Labor is a most important consideration in the building of a vessel. This has been steady during the year with very small advances in wages. At present the tendency of wages is downward with efficiency as high, if not higher, than at any time during the last four years. This is caused, to a certain extent at least, by the yard working only fifty per cent. capacity with only six months' actual work in sight. The fact remains, however, that the men are more experienced and take a keener interest in their work. It is besides all local labor, familiar with steel works and the working of steel for years before steel shipbuilding started, and for an intelligent all-round man he is hard to beat.

The outlook, however, is not the brightest for 1921, as the rock bottom price for tonnage has not yet been reached, and with many ships tied up in American and other ports, it is difficult to see how the demand and price for tonnage can be much improved until this tonnage is taken care of.

We might, however, get some encouragement from an "inlook"—a thorough

investigation of ourselves, our methods and our organization to see what can be done to improve our product, eliminate waste of all kinds, high and low, and reach out for foreign markets, for shipbuilding is a world industry. The state of exchange is perhaps the greatest obstacle at the moment to the latter, but there is nothing to prevent the former, and there was never a time in Canada when it was more urgently required.

Lack of Orders for Ships

By J. E. McLurg

Halifax Shipyards, Limited, Halifax.

STEEL and coal are our raw materials; the supply of steel plates from Sydney has been excellent, probably because our orders were placed in ample time to secure deliveries required, but it has been difficult to get shipment from the United States of orders for steel shipbuilding shapes not rolled in Canada; latterly this condition has much improved. There has been no change in the price of Sydney plates, although the freight rate has been increased. There have been some changes in the prices of steel shapes rolled by the independent mills in the United States, but the United States Steel Company has made no variation in its prices.

The supply of labor is greater than our demand, and although we have made no reduction in the rates of pay, it is possible that wages will be reduced in 1921. We probably have experienced a slight increase in the efficiency of labor during the year; the percentage of attendance has greatly improved during the last six months. There is a great deal of unemployment in the shipbuilding industry in Canada, caused by a lack of orders. Several companies are in the hands of receivers and their plants are closed down.

We have found it impossible during 1920 to secure an order for a steel ship, either in America or in Europe.

The outlook for the shipbuilding business in Canada for 1921, is that by next July every shipbuilding plant in this country will be closed down for lack of orders.

Prospects are Dark

By J. Wilkinson

Midland Shipbuilding Co., Limited, Midland.

WE are sorry at this particular time that there is not very much to say as the prospects for shipbuilding are very black indeed at present. Various yards have closed down for lack of orders and there is nothing in sight for those now running.

In the matter of supply of raw materials, our product is principally steel; the supply is fairly good and prices are coming down slightly. As for labor, during the last quarter of the year, labor's efficiency has been good and the supply has been plentiful with no great difference in wages.

Conditions in the Saddlery Industry

By B. F. ACKERMAN

B. F. Ackerman, Son & Co., Limited, Peterborough

SUPPLIES of raw material seem to be abundant at present and prices are dropping rapidly. There is more labor being offered at present than we can take care of. General efficiency appears to be about the same as in 1919. Wages have increased over 1919, but we have made no change during recent months and any future change, from present indications, will be downward.

Up to the present time, we have been operating at full time. In fact, in September, owing to an increased quantity of spring business, we increased the staff in our harness and collar departments considerably.

The demand for our goods (boots excepted) up to Oct. 1st appeared to be about normal and our sales up to that time were about on a par with 1919. However, since that time, decreased prices on leather have upset the trade considerably, making them nervous, so that they have curtailed their buying to their actual requirements, apparently not taking any chance on buying any stock ahead. Prospects for the future are not up to last season. While we booked considerably more spring business, cancellations have much exceeded 1919, which we attribute to two reasons: expectation that prices will be lower, and lack of demand, owing to present low price of western grain.

Price movement in finished products have been decidedly downward. We are reducing prices in conformity with the change in raw material, but we do not find reduced prices are increasing the business. In fact, it seems to have a tendency to result in increasing cancellations.

We do not think, in the leather business, the process of deflation has been completed, as we are continually receiving offers of leather at lower prices both from Canadian and American tanners. We do not think, however, that materials are being offered at a fair market price, as no doubt in many cases much of this material is being offered at less than actual cost. Prices seem to be made on a basis of the necessity of the vendors to secure funds.

Regarding the outlook for 1921; if we accepted the conditions prevailing to-day as a fair indication, we would have to admit that they would appear rather hopeless at the present time. We have, however, in the past, always had at this season of the year more or less cancellations and we have found in many cases that along about the middle of January many orders are reinstated. We feel that this will occur again this year. We believe there is a great shortage of saddlery goods at present in Canada, owing to the fact that other factories have not been producing the volume made in other years and, if crops are going to be put in again in Western Canada in 1921, it is going to require a large quantity of harness and other saddlery equipments for this purpose. Farmers, this spring should have an incentive to buy, because for the first time in five years they will be able to buy at lower prices. We are quite satisfied that the retail harness shops have no stocks on hand to speak of, and of late years they have not been manufacturing to any extent, which means that they have to buy practically all their requirements and, while a farmer may succeed in using his old equipment to some extent, we really feel satisfied that by the first of May the turnover of saddlery goods will not be very much less than during 1919. It will, however, be a very difficult trade to handle because, no doubt, it will be more of a rush business than we have had for many years.

The Brush Industry

By John C. Boeckh

The Boeckh Co., Limited, Toronto.

CONDITIONS in the brush industry have not varied very greatly during the past year. The heavy demand which has existed for some time still continues, though there is at present a tendency on the part of the retailers to refrain from placing orders for immediate delivery except in comparatively small lots. We anticipate, however, that the turn of the year will see a renewed demand.

Prices of raw materials which have been advancing during the last few years, are now practically stationary but the tendency to reductions is not as yet noticeable to any extent. Materials are still scarce and are likely to be so for some time, though we have in one or two instances been able to get materials at slightly lower prices, due to buying in more favorable markets.

Labor is more plentiful, but no reduction in wages has taken place, and as long as the demand for our product continues, it is not likely that wages can be reduced.

Prices of our products have advanced during the past year, due to the greatly increased costs of materials, labor and expenses, etc., and while we do not look for any further advances, reductions at any moment are not likely to take place.

The heavy demand for our product should continue during 1921, as it is quite apparent that there is a very urgent need of more buildings of all kinds, mainly dwellings. Also the re-painting of buildings, etc., has been deferred for so long that the time is at hand when a great deal of painting will have to be done to preserve them from a state of absolute decay.

CONDITIONS IN THE LUMBERING INDUSTRY

Costs are Mounting

By W. F. Beck

The C. Beck Manufacturing Co., Limited, Penetanguishene.

THE lumber business of Ontario requires each year to go farther and rther back into the inaccessible reons of Northern Ontario, and consetently the cost of getting the lumber mounting each year. The trend of ices will therefore be upward.

During the early part of the fall, when eryone was going into the bush, there is a scarcity of labor and wages were creased approximately 20 per cent. er last year. This also will have a tdency to increase costs considerably re than last year. However, within t last month there has been a remarkle change come over the whole situatn, and now there is a great surplus of lor, but not efficient, so that every firm uld hesitate to lower wages and disganize his work. The only advantage wl be, that there should be considerably re efficiency shown, which will have a tendency to offset the increase in wges made earlier in the season.

The early months of 1920 were exceptnal ones from a market standpoint, as pes were increased over night continously, but the last six months there hve been no sales whatever, and while pes remained stationary on all white pi, the cheaper grades were sacrificed atprices for which they simply cannot beeplaced, so that there is every indicatid that when this "No Buy" movement is ver and people settle down to a reonable turn of business, there will be onsiderable increase in all the lower rles of lumber.

The export market has been fairly ctve, but we do not come directly in contact with it, handling this stock principally through the wholesale exporters.

There does not appear to be any reason for this period of depression to be of long duration in the country, as we are bound to grow very fast through immigration from both Europe and the United States. We will be forced to work to full capacity to supply our domestic trade. There has been a tremendous increase in the wealth of the country, and especially in the United States, which will be reflected in this country.

Spring will see Boom

By G. L. Main

G. Mason & Co., Limited, Midland.

AT the present time the demand for pine lumber is slight but the prices have weakened very little. There is not a very large available supply as many mills did not get their logs down last spring, owing to low water, and in consequence did not have anything like a normal cut. In the early fall bushmen were scarce and wages even higher than last year. In spite of this men did not stay long and camp efficiency was badly hampered by constantly changing crews. At the present moment there are more men out of employment than the camps can readily absorb and wages have dropped from $70 and $80 per month to $50 and $65. Unfortunately few of the men now available have ever done bush work, and that hampers production.

All of the 1920 lumber found ready sale at good prices, and few yards are carrying over much unsold stock as far as pine is concerned. Hemlock opened very strongly in the spring but latterly has not been in much demand, and the price has weakened in sympathy. Many English firms are now buying direct from Canadian mills, thus eliminating the "middleman's" profit, and there has been a brisk demand until latterly for export stock, especially on "best" quality pine.

It is difficult to forecast the 1921 market. Certainly logs are costing just as much, in fact more, to get out than they did last year. Every year sees the available quantity of white pine grow less and the camps are built farther and farther from the mills. Every mile means increased cost. We can only say that we are operating on a bigger scale than in any previous year, and that we are confident that spring will see an industrial boom, coupled with an amount of building and expansion that will keep the price of pine lumber up to the 1920 level. We see no reason why 1921 should not be a banner year.

Demand has Weakened

By George W. Grier

G. A. Grier & Sons, Limited, Montreal.

ONE hesitates to make any predictions regarding the future of the lumber industry, or any other industry, at the present time. Lumber prices on the Pacific coast, both in the U.S. and Canada, and also in the Southern States, have receded very considerably from the levels that were reached last winter and spring. The deflation has not been so pronounced in Eastern Canada, especially as regards soft woods, namely, spruce and white pine. The keen demand for pulpwood has caused a big output of this class of stock, much of which might have gone into the making of spruce lumber of small dimensions. The production of white pine in the Ottawa Valley, and in Ontario, appears to be steadily decreas-

ing so that the stocks on hand to-day of white pine are light.

Should any strong demand, or even moderate demand, develop for lumber during the coming spring, it does not appear that prices of spruce and white pine in Ontario, Quebec and the Maritime Provinces, would recede to any very great extent.

Many small manufacturers of lumber are unable to finance operations this winter and are therefore not going to produce any lumber during the coming year. The total of these small operations amounts to a good deal in a year, and this condition should reduce very considerably the output of lumber to be sawn next summer. This applies particularly to spruce and hardwoods.

During the past year the demand for lumber for the first six months or so was strong, and good prices were easily obtained. Since the middle of the summer, however, the demand has continually weakened and at the present time there is practically no buying going on.

Reducing the Cut

By J. H. Irving

J. D. Irving, Limited, Buctouche, N.B.

AS to supply of raw materials, this in our case is lumber only, and under the present market conditions, it will have to reduce. At the present time we are converting a considerable part of our lumber into pulp, for which we are pleased to say we have contracted at a fair price.

The N.B. Lumberman's Association at a recent meeting agreed to a reduction of about 30 per cent. in wages, which will go into effect the first of the year, on account of the Maine and border States reducing their wages below ours. As there is considerable more woods labor through this locality than there is employment for, which has been meeting a fair demand through the United States channels, we feel that on account of the reduction, we will have an abundance of labor. During the past year the efficiency has continued to decline, but we now feel on account of the abundance of labor, it will be more efficient.

As in all lumber trades, the price was good during the early season when we sold our output, but any who held on to their stock expecting higher market last fall, have met with about 30 per cent. decrease, and we are anticipating a still further decrease on account of the low prices now offered the mills in British Columbia, which we understand to-day is about $15.00. On account of the money stringency and the unemployment we cannot see any opening to any increased demand for some considerable time yet. We understand there is over one hundred million feet of lumber on the north shore of New Brunswick unsold, in addition to about one hundred thousand feet more sold the British Admiralty and companies. If this Admiralty and other British-owned stock is dumped on the American markets instead of being taken to Great Britain and the European markets, it would, no doubt, deflate the market still further.

We are, nevertheless, pleased to say that practically all firms on the north shore have reduced their objective for 1921 by from 50 per cent. to 75 per cent. in order to give the market a chance to straighten out. We, therefore, feel the 1921 cut will not be anything like sufficient to fill the requirements, which will have the result of deflating present stocks, and we trust that at least this will help the market at the present low level, if not stimulate it.

Conditions Propitious

By Ward C. Hughson

Gilmour & Hughson, Limited, Hull.

THE supply of logs in the Ottawa valley is very small and the trend of log prices is toward a higher level of cost. Labor has been if anything more unreliable and difficult to deal with than at any time since the beginning of the war. I am of the opinion that it has reached the culmination of its arbitrariness and at this writing has a marked tendency on the down grade. Being now in much greater supply at a reduced scale of wages, as seems natural, it is showing a tendency to give a more fair day's work for wages paid.

The market for lumber has been good, the supply small and values correspondingly high.

There has been no inflation so far as quantity is concerned, therefore no deflation can take place. Stocks have been, as said before, in small supply since 1915 and continue so. As to prices, they have been only what is commensurate with cost. Any noticeable decline at the present time is due to, not over supply, but decrease in demand and the general feeling on the part of all for a reduction in the cost of living and to a hardening of rates and conditions for money to speculative builders.

It would appear that as freight rates lower the prospects for export increase.

Unless we meet with a general financial upheaval, which seems now unlikely, it would appear to me that with the small out-turn of the mills in Canada in 1920, very much reduced stocks compared with past production (just about half), it would seem a physical impossibility that lumber and kindred business should be anything but propitious for 1921.

No Reason for Pessimism

By W. G. Clarke

Clarke Brothers, Limited, Bear River, N.S.

THE matter of supply of raw materials is now very satisfactory, except that coal is still difficult to obtain, and prices have not as yet made any material decline in many of these commodities.

The supply of labor at the beginning of the year and for the first six months, was somewhat inadequate. This condition has been entirely remedied, however, and we have now an ample supply of labor at wages slightly below the figures ruling say the first of August, with a declining tendency. Up to say the first of September, labor was not more than sixty per cent. efficient. An improvement in this respect has, and is, taking place daily, due to the increased offering of labor, and we would now regard labor as practically seventy per cent. efficient.

In some departments of our work notably the lumbering end, the supply of labor is now adequate, indeed the supply is now in excess of the demand, with a declining tendency in the wage list.

The market for our commodities clothespins and dowels, during the first six months of the year, was good. The dowel market still remains fairly active but there is a diminishing demand for clothespins.

In regard to the outlook for 1921, we have excellent crops in Canada; prices for all agricultural products are fairly good and there is a demand for everything offering in this department. We see no reason why with a continued deflation down to a point where industries may be stabilized, there should not be after the turn of the new year, a normal demand for such products as are native to this country, and while some months may pass before the consuming public are satisfied that conditions have reached a normal standard, we see no reason for pessimism in present conditions. Business in all departments is more or less unsettled, due to the abnormal conditions that have prevailed for the past twelve months, but a sane and reasonable view of existing conditions does not seem to warrant the feeling abroad in some quarters, that we are up against a long period of low prices and hard times.

Better Trade by Fall

By W. W. Carter

Fesserton Timber Co., Limited, Toronto.

WE have found that the cost of supplies of all kinds used in connection with the lumber business steadily advanced throughout the first nine months. The past three months' supplies have been a little cheaper, but are still high.

Labor in the mills and on drives has been very high throughout the year, and on account of the enormous profits that pulp and paper people have been making, they have been offering enormous wages to labor to take out pulpwood. In the district we were in they offered as high as $125.00 a month and board and it is practically impossible for the lumberman to compete with wages like the pulp and paper people, as the price on lumber is so much less, and the lumber market has been on the downward grade. Some items during the past few months have been reduced $15.00 per M and in the camps at the present time

A British Columbia Sawmill

wages are very high. During the past few weeks labor is plentiful and more efficient, and the tendency is to reduce wages.

At present there is practically no market for lumber, only odd people buying odd items when they have run out of stock, and buying small quantities, as they are all waiting for further reductions, and prices, as stated above, of all classes of lumber have come down the last few months. Some lines have taken a tremendous drop, and the millmen and wholesalers who have lumber, especially some lines, on hand, have to take a tremendous loss, and it looks to us, both in the manufacturing and wholesale end, that the prices are now down to a point where they should remain, but retail people have not reduced the prices the same as the manufacturer or wholesaler, as no doubt they are holding off to get rid of all the high-priced lumber they can at old-time prices.

The export trade has been very good all summer, but the American market for the past three months has been off, and very little lumber has been shipped to the American market since the increase in rates of freight, and the market there is practically the same as in Canada, nothing doing, simply everyone waiting for lower prices.

We expect that as soon as prices get to a level and confidence is restored, which no doubt will take part of 1921, a good trade in lumber will develop. Throughout all our large cities in Canada and the U.S. there is a great shortage of houses, and when prices of lumber are stabilized so that builders can figure on a profit, we believe the lumber market will be good. Stocks on hand are not large, and there is going to be a small cut this winter on account of high wages, so we are looking forward to a good trade for the latter part of 1921.

In New Brunswick

By W. B. Snowball

J. B. Snowball Co., Ltd., Chatham, N.B.

THE optimism of the closing months of 1919 and first portion of 1920, induced all those who had timber lands, either Government, leased or private owned, to cut the largest quantity possible. The result has been the largest output in the history of this district. In many cases the rafting booms were unable to raft out all the logs that came into them and the mill capacity was insufficient to saw same even if they had been rafted. We, therefore, found ourselves with a quantity of logs unrafted and unsawn when the season closed.

High prices for manufactured lumber were paid during the early months of the year and extensive contracts entered into with both American and Canadian wholesale buyers. At this time the British market was still feeling the effect of overstock imported by the British Government and feared what might be done with the stock still lying in Canada; thus our natural and usual customer was not a buyer except to a very limited extent, and the effect of this, as well as the shortage of cars and difficulty of shipping to the United States, not only caused a weakening of the price, but brought out many cancellations of contracts already made.

The American market was not responding to the high prices; house building was not being carried on, and by July the lumber market was feeling the pinch and it became almost impossible to sell.

High wages prevailed during last season in the woods and big increases were demanded over previous years by the men rafting logs and those employed in the sawmills. The result is that all stock held by millmen has been produced at heavy cost.

The demand for pulpwood and the high prices being offered for peeled and rossed wood that occurred in August created a demand for men for the woods to get this out and with no over supply, men were able to demand even higher wages than were paid during the previous season, and the millmen were surely handicapped in keeping their plants going.

When logging operation time again came around, men were scarce and high wages had to be paid by those who required to get out logs to supply their mills for 1921. Men from this district were taken up to Quebec and Ontario to assist in the pulpwood operations.

The sawlogs now being wintered as well as the sawn lumber on hand was produced at the peak of high cost in wages and material, and the logs being got out during this winter are not only subject to the wages of last year and in most cases provisions at last year's costs, but the New Brunswick Government stumpage this year is $5.00 per M. as against $3.50 during 1919-20. Serious reduction in price would mean a financial loss, but this we are not looking for.

Lumber prices were not advanced in the same proportion as many other manufactured articles, and with the readjustment now taking place, we look for a revival of trade in building with the opening spring months.

The output in New Brunswick of sawlogs is not expected to be over 50 per cent. of last year, and will make quite a reduction in the supply of new stock.

The settlement of the Irish question, which we hope for during the next few months, will open up a good market for deals and we can also look for an improvement in the English market with the general readjustment of business which is taking place there.

Lumbermen need not be depressed. Out of the depression that has prevailed will come stability and a reasonable prosperity in the coming year, and with the curtailment in the woods operations and a strong holding of the present stocks and the outlook for cheaper manufacturing costs during the summer of 1921 they can reasonably expect to have a good year during 1921.

The Canadian International Paper Company of Three Rivers have taken out letters of incorporation from the Quebec Government, their authorized capital being $20,000,000. They are empowered to manufacture and deal in all kinds of wood, pulp and paper.

STATE OF THE MINING INDUSTRY IN CANADA

Scene in a British Columbia Mining Camp

By WYATT MALCOLM
Geological Survey, Ottawa

THE return of the industrial world to a normal state has been long delayed. Throughout much of the year, therefore, the mining industry has had to adopt itself to the extraordinary conditions produced by a long period of lavish spending on the part of a people relieved from the depressing influence of the great war.

Industries that sprang up and grew to meet the demand for luxuries continued to control the labor market. The period of reconstruction was postponed, and the re-establishment of the more basic industries that are productive of real national wealth and contribute to the comforts and necessities of the mass of mankind has not proceeded on as large a scale as could be desired. Reconstruction in the devastated countries of Europe has not been rapid; building and other constructive work that was postponed throughout the world during the war has made little advancement; and the replacement of obsolete and worn-out machinery and manufacturing plants has been slow. The people asked for luxuries, and the basic industries suffered.

Not at Capacity

The mineral industry was affected by labor shortage and consequent inefficiency. This prevented many mines from working to capacity, such as the coal mines of Nova Scotia, the silver mines of Cobalt, the products of which commanded a very high price early in the year, and the gold mines of Northern Ontario, where ore is sufficiently high-grade to be worked with profit even with labor and supplies standing at the high price they attained during the year. In the case of other minerals such as copper the market price of the metal was not commensurate with the cost of labor and supplies, and there was little inducement to work to capacity.

In spite of these drawbacks the mining industry was in general in a fairly satisfactory condition during the first half of the year.

The period of deflation has arrived and the mining industry is suffering a temporary reverse. The demand for nickel has declined and mining operations are greatly reduced. A heavy fall has taken place in the market for such base metals as copper, lead and zinc, and companies that were making only a small profit at prices that prevailed early in the year, may be forced to discontinue operations temporarily. The cost of supplies has not decreased in the same proportion as the price of the metals, and adjustment of wages cannot be made abruptly to meet the falling market. The depression is accentuated by a lack of buyers in the metal market, the consumers hoping for still lower prices. Stocks thus accumulate. Lead is now an article of import from Europe into America, and there must be some anxiety on the part of Canadian mining companies regarding tariff revision by the Republican party in the United States, who state that the American market must be preserved for American products.

The Leading Minerals

A brief review of the situation with regard to a few of the leading minerals follows:

The asbestos mines of Quebec have continued active during the year. The demand was brisk and the price good. There was an unfortunate scarcity of cars and the industry was affected by a shortage of labor and by strikes of short duration, but on the whole the production was highly satisfactory. By surface work, tunnelling and diamond drilling large reserves of pay rock have been blocked out, so that the life of the industry is assured for many years. The mining of chromite has assumed sturdy proportions; one company was active throughout th year, and anothe company bega milling operation in August. Bot are now engage in mining an milling nearly t capacity. The ra ed capacity of th two mills is 27 tons of ore pe day; a ton o concentrates i produced from si to eight tons o ore.

The output o coal in Nov Scotia is stil hampered b shortage of pro ductive labor an by a marked de crease in recent years in the output pe man, so that the production for the yea will possibly not exceed that for 1919. I Alberta activities have been lively; th attempts of labor agitators to tie up th industry did not meet with the success they desired and there is a likelihood that th production for 1920 may equal or exceed that of 1918, which amounted to mor than 6,000,000 tons, Alberta then takin leading place among the provinces in pro duction.

Copper Production

The greater proportion of the coppe produced in Canada came from large de posits at Anyox and Britannia Beach British Columbia, and the nickel-coppe deposits of Sudbury, Ontario. The produ tion from Sudbury is dependent on th market for nickel. The deposits o British Columbia were not worked t capacity. Low grade ores are usuall worked at a small margin of profit; th heavy slump in the copper market lat in the year may therefore have a ver depressing effect on the industry. As a offset to this there will follow a decreas in the cost of supplies, an increase i available labor and an increase in labo efficiency, but these ameliorating cond tions unfortunately suffer from conside able lag.

The starting of mining operations i October by the Canada Copper Corpor tion on Copper Mountain in souther British Columbia is the passing of a other milestone in the progress of th copper mining industry of Canada. Se eral million dollars have been spent in th development of a large body of ore l low grade, in the erection of a conce trator, in the construction of a railwa through very difficult mountainous cou try, and in the extension of a pow

transmission line. The ore runs about 2 per cent. copper and carries small quantities of gold and silver. The concentrates will be treated at the smelter of the Consolidated Mining and Smelting Company at Trail. Power is obtained from Bonnington Falls, 190 miles distant.

Gold Mining

In spite of shortage of labor and the high cost of supplies, gold mining has been actively pursued at Porcupine, the main gold district of Canada, and at some of the neighboring camps. The production of gold in Ontario during the first nine months of 1920 was 424,000 ounces as compared with 366,000 ounces during the same period in 1919. Placer mining in Yukon territory suffered on account of low water. The high cost of operating forced the Hedley mine, one of the most important gold mines of British Columbia, to suspend work. The gold mines of Ontario were forced to operate much below capacity, but with the easing in the labor stringency, however, they may be able to approach more nearly to capacity. Large reserves of ore have been developed and the milling capacity is great; as the factors impeding progress are removed by changes in economic conditions the gold production of Canada should therefore reach a very high figure. A temporary delay is occasioned by a limitation of power due to the dryness of the season.

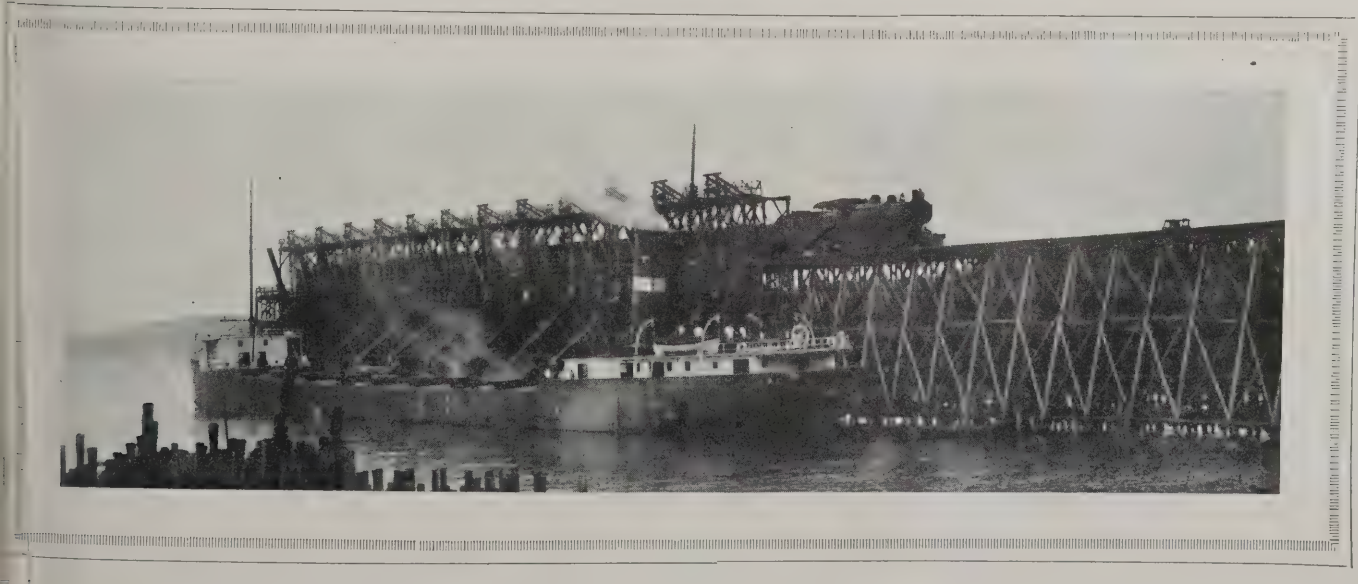
The nickel industry, which was in a thriving condition during the first half of the year, was affected by the general depression that came over industrial enterprises towards the end of the year, and there has been a slackening in production. This is due probably in large part to the falling-off in the manufacture of automobiles. There are now three operating companies with furnaces in the Sudbury district for smelting the ore. During the first nine months of the year 81,000 tons of ore were smelted, the total output of nickel-copper matte being 44,922 tons as compared with 30,942 tons for the first nine months of 1919.

Considerable attention is being given to an occurrence on Bear River, north of Lac du Bonnet, southeastern Manitoba, of a body of mineralized norite strikingly similar to the Sudbury norite in origin and character. The economic minerals are chalcopyrite and nickeliferous pyrrhotite. Analyses have been made of a number of samples with the following results:

	Maximum.	Minimum.
Copper ...	3.60 per cent.	0.68 per cent.
Nickel ...	1.68 per cent.	0.29 per cent.
Platinum metal, oz. per ton	0.03 per cent.	0.01 per cent.

The deposits will probably be tested by diamond drill this winter.

Oil Discoveries



An event that has excited great interest is the discovery of petroleum by the Imperial Oil Company in a well drilled near Norman on Mackenzie River. The strength of the flow is a matter of great encouragement, but the remoteness from a market and the serious difficulties of transportation raise misgivings as to the commercial value of the discovery. Notwithstanding this, it must be considered an event of great moment in the history of the mining industry for 1920. It is of great importance because it has demonstrated the fact that petroleum occurs in quantity in the Devonian rocks of this part of Canada. It is from Devonian formations that most of the oil of Ontario is derived. The occurrence of seepages from rocks of this age in the Mackenzie basin had led geologists to believe that oil might be struck by drilling, a belief that has been confirmed by the events at Norman. Rocks of Devonian age are of very wide extent in Mackenzie River basin, stretching from near the mouth of the river southward to beyond Lake Athabaska. On Athabaska and Peace rivers they are overlapped by younger cretaceous sediments.

As pointed out a year ago there seems to be plenty of money available for prospecting for petroleum. Oil companies of strong financial standing employed a number of geologists during the summer of 1920 to make a careful study of the structural features of the geological formations of the Prairie Provinces and the Mackenzie River basin to ascertain in what localities it is advisable to carry on boring operations. The Imperial Oil Company had several rigs drilling in Alberta and to the north during the summer. Interest is also being taken in the possibility of opening hitherto undiscovered oil pools in Ontario. Several wells were bored on Manitoulin Island and further boring was undertaken in the Dover field.

The extremely high prices for silver prevailing during the early part of the year produced a buoyant optimism in silver mining camps. Although the cost of mining had increased enormously, the advance in the value of silver led to an extension of operations at Cobalt and to the mining of ore of much lower grade than it had previously been possible to mine at a profit; mill tailings and dumps that had been discarded as waste rock were worked over. Renewed interest was taken in the silver deposits of Gowganda and South Lorrain. Silver production in Ontario for the first nine months of 1920 was 7,831,000 ounces, that is, 356,000 ounces more than for a similar period in 1919.

Seeking Silver at Depth

Exploratory work that may prove of great importance to Cobalt is being done at the Crown Reserve mine. A deep boring is being made to test the possibilities of the occurrence of silver ore at depth and to ascertain whether another diabase sill occurs beneath the one with which it is believed the known ore bodies are genetically connected.

Landing Ore at Michipicoten for the Algoma Steel Corporation

A large amount of exploration work was done in Salmon River and Alice Arm areas, northwestern British Columbia. As a result the Dolly Varden of Alice Arm has shipped a quantity of ore during the year. The Salmon River area has been somewhat disappointing, the large low grade deposits not proving as rich as it had been hoped. The Premier mine, however, is preparing to make shipments this winter and is installing a concentrator.

The heavy decline in silver during the last half of the year has been discouraging, and as it has in some cases wiped out, or nearly wiped out, the margin of profit it will probably lead to a curtailment of operations.

When deflation has been completed and price adjustments have been made acceptable to the consuming public there will be a renewal of industrial activities and a revival of reconstructive processes. When this takes place a heavy demand will be made for the base metals and structural materials, and the mines and quarries of Canada with their large developed reserves will be important factors in supplying the demand.

The Metallurgical Industry

By W. B. TIMM

Chief of Division, Division of Ore Dressing and Metallurgy

THE Metallurgical Industry, like all other industries, is passing through a period of uncertainty in changing from war to normal conditions. The cessation of hostilities left tremendous stocks of those metals used for munitions and ordnance purposes on hand, and in some cases over-production has increased rather than diminished during the past two years, owing to the inability of the manufacturers to use up these stocks for industrial purposes.

Those companies producing copper, nickel, zinc and lead find themselves in a peculiar position with the markets down to almost pre-war prices and with very little reduction as yet in the cost of materials and wages. Until there is a marked decline in the costs of materials entering into metallurgical operations and in the wages paid to labor, and until the manufacturing concerns can increase the use of these metals for industrial purposes, these companies will be forced to decrease their production or suspend operations until such time as conditions are more favorable.

Iron and Steel.

The iron and steel industry is in a more favorable condition, in fact the average monthly production of pig iron and steel has increased over that of last year, and compare favorably with the 1916 production, the third year of the war. The following tables bear out this fact:—

MONTHLY PRODUCTION OF PIG IRON IN CANADA,

1916 - 1920.

(In short tons).

	1916.	1917.	1918.	1919.	1920*
January	.....	89,187	74,239	103,963	81,494

Average monthly	106,268	145,494	156,954	86,157	105,931

For some time past the people of British Columbia have been asking for Government assistance in connection with the establishment of an iron and steel industry on the Pacific Coast. Such an industry could not be confined to British Columbia with her limited markets, but would necessarily have to include the Pacific Coast States.

Experimental work has been conducted on the electrical smelting of the British Columbia ores, and it is reported that a company operating at Seattle, Washington, is producing a high grade of iron from these ores. The most promising report is that a company has been formed, backed by British capital, which is now looking into the resources of iron, coal and limestone of the province, and if sufficient quantities are obtainable, propose erecting a large iron and steel works on the lower mainland.

In Ontario, the situation is unchanged with the exception that the Algoma Steel Corporation are making an addition to their plant. A new structural mill is being built for the manufacture of shapes etc.

The United States Steel Corporation's plant at Ojibway is under course of construction.

In the Maritime Provinces, the Empire Steel Corporation has been formed, consisting of the amalgamation of several of the older companies, making a strong combination which should be in a position to compete with the large American steel companies in the world's markets and thus enhance Canada's trade with foreign countries.

In February last the Dominion Iron and Steel Company put into operation their new ship-plate rolling mill. On the successful operation of this mill will depend to a large extent the advancement and extension of the Canadian shipbuilding industries.

During the past year numerous articles have been written in the press and mining journals advocating assistance by the Government in the payment of bounty on the iron ores mined in Canada with the object of making Canada independent of the United States for her iron and steel. The arguments for such bounty have been given added weight from the fact that the large iron corporations in the States realize that the high grade iron ore of the Lake Superior region has a limited life, and attention is now being given to their low grade ore bodies, of which Canada has a number of similar occurrences. The Mesabi Iron Company have demonstrated in an experimental plant at Duluth, that the low grade bodies can be worked economically and have installed at Babbitt, Minn., a commercial plant to treat the ores on a large scale. The assumption is that with Government assistance a number of our low grade bodies could also be put on a commercial basis and thus help to make the country independent for her iron ore supply.

Experimental work is being conducted by Professor Alfred Stansfield, of McG

University, and by Mr. J. W. Moffatt, of Toronto, on the reduction of low grade iron ores in a metallizing furnace, converting the iron content into sponge iron and finishing in an electric furnace. These experiments are interesting and may be the means of utilizing to some extent at least our low grade iron ores.

Ferro-Alloys

One of the results of Canada's efforts to supply those products necessary for the successful prosecution of the war has been the creation of a ferro-alloy industry. Ferro-silicon was produced by the Electro-Metals Company at Welland, Ont., Ferro-molybdenum by the Tivani Electric Steel Company at Belleville, Ont., and by the International Molybdenum Company at Orillia, Ont., and Ferro-manganese at Orillia, Ont. Our steel works are now using many of these alloys in the manufacture of manganese, chrome, copper-nickel, and other castings which were for the most part imported previous to the war. The alloy "Stellite" is a Canadian product used extensively for tool steel and other purposes.

Copper

Canada has been making progress in the development of her copper resources. The introduction of oil flotation as a successful process for the concentration of low grade ore bodies has assisted materially in this development. The Britannia Mining and Smelting Company at Britannia Beach, B.C., were the first to adopt this process on a large scale. The Granby Consolidated Mining, Smelting and Power Company at Anyox, B.C., propose installing a flotation mill to treat their low grade Hidden Creek ores. The Canada Copper Corporation have completed and lately put into operation a large concentrator using flotation. The Consolidated Mining and Smelting Company of Canada, Trail, B.C., have found the process successful for the treatment of their Rossland ores, and a large concentrator is under course of construction. Flotation will also probably be used for the concentration of the low grade ores of the Flin Flon Mine in North-western Manitoba. It has been in successful operation at the Eastern Mining and Milling Company's property at Eastman, Quebec.

Enlarged Their Refinery.

During the year the Consolidated Mining and Smelting Company of Canada have enlarged their copper refinery in order to handle the concentrates of the Canada Copper Corporation and those from the new concentrator, mentioned above, for the Rossland ores. A rod mill has been installed, which represents an entirely new line of industrial activity for this Company. Heretofore copper has been exported to the United States, rods produced, and the material reshipped to Canada for conversion into copper wire. This marks a further advance in the independence of Canada, as far as this particular metal is concerned.

Nickel

Canada produces 85 per cent. of the world's requirements of nickel, and the production was greatly increased by its use for armour plate, ordnance and projectiles. It has been found, however, that the metal can be used for many other purposes, and its value in industrial steels is rapidly growing. It is used in the manufacture of rails for terminal points, automobile steel, safe steel and for structural steel requiring great strength and resistance under heavy duty.

The three principal producing companies are the International Nickel Company of Canada, with smelting works at Copper Cliff, Ont., and refining plants at Port Colborne, Ont.; the Mond Nickel Company, with smelting works at Coniston, Ont., and refining plants at Swansea, Wales; and the British America Nickel Company, with smelting works at Nickelton, Ont., and refining plants at Deschenes, Que. The works of the latter company are comparatively recent; the refinery at Deschenes being put into operation during the early part of 1920. At these works the Hybinette method of electrolytic refining is used, which requires a large amount of electric power. This power is being supplied by the Hydro-Electric companies in the vicinity of Ottawa. Besides the refined nickel and copper produced, the companies recover to some extent the small amounts of precious metals, such as platinum, gold and silver in the ores.

The Deloro Smelting and Refining Company at Deloro, Ont., and the Coniagas Reduction Company at Thorold, Ont., have been operating during the year on the reduction of the ores, concentrates, etc., from the Cobalt mines and mills, and the ores from the Gowganda district. They have been producing silver bullion, cobalt and nickel oxide, metallic cobalt and nickel and

Callow Pneumatic Flotation Cells in Operation, Showing Concentrates Passing Over in Froth

white arsenic. At the works of the Deloro Smelting and Refining Company the alloy Stellite is produced, and the company is installing a cutlery plant for the manufacture of cutlery, surgical instruments, etc. Owing to market conditions these companies have been forced to curtail operations to some extent. The diminishing supply of ore from the Cobalt District will have the effect of decreasing the production of their reduction products.

Lead and Zinc

The foremost producer of lead and zinc in Canada has been the Consolidated Mining and Smelting Company, Trail, B.C. The advancement of this industry has been due to their efforts to treat commercially the lead-zinc ores of British Columbia, a great number of which are of a complex character. A process has been developed for the ores of the Sullivan Mine at Kimberley, B.C., one of the largest zinc-lead mines on the continent, and an experimental mill has been in operation for some time on the separation of the lead, zinc and iron sulphides in this ore. A large plant is to be installed for this purpose. The successful operation of the electrolytic refinery depends to a large extent on the separation of these minerals. The products of the Trail plant are electrolytic lead, zinc, and copper, copper rods, as well as a considerable quantity of silver and gold.

A concentrator has been built at Maus Creek, Fort Steel, B.C., to treat the silver-lead-zinc ores of the Victor Mine.

A process has been developed to treat the silver-lead-zinc ore of the Standard Mine, Silverton, B.C., by preferential flotation, and a small plant installed to test out the process on a commercial scale.

The old Lanark Mine at Revelstoke has been reopened, considerable ore blocked out, and a small concentrator erected to treat the silver-lead ores from the property.

In Eastern Canada the Federal Lead Company are making arrangements to build a concentrator to treat the lead-zinc ores of Gaspe Peninsula, Quebec.

Other Metals

In the manufacture of sheets, cans, etc., Canada consumes a considerable quantity of tin metal, which is imported into the country. The Electro-Tin Products Company have installed at Brantford, Ont., a small electric smelting and refining plant for the reduction of tin ores to the metal. Ores are imported from Bolivia.

At Shawinigan Falls, Quebec, the Northern Aluminum Company are producing aluminum from ores imported from the United States. A mill for the manufacture of wire and cables is operated by this company.

Golden and crimson sulphides of antimony are produced at Lake George, N.B. The North American Antimony Smelting Company propose erecting a flotation mill to treat their low grade ores.

The concentrating plants operating on the ores of molybdenum have been closed down. Canada produced during the war a considerable quantity of molybdenum concentrates which was reduced to ferro-molybdenum and also exported to France, England and the United States. It is to be hoped that this industry will revive during the coming year.

The Precious Metals

There has been increased activity in the production of gold and silver. This has been due to the high market price for silver, the certainty of obtaining material and supplies and an increased supply of labor. Several new mills have been put into operation in the gold mining districts of Northern Ontario, and we can confidently expect a greater activity during the coming year.

The new silver areas of the Stewart District, B.C., and of the Mayo District, Yukon Territory, may make up for any decrease in the production from the Cobalt District.

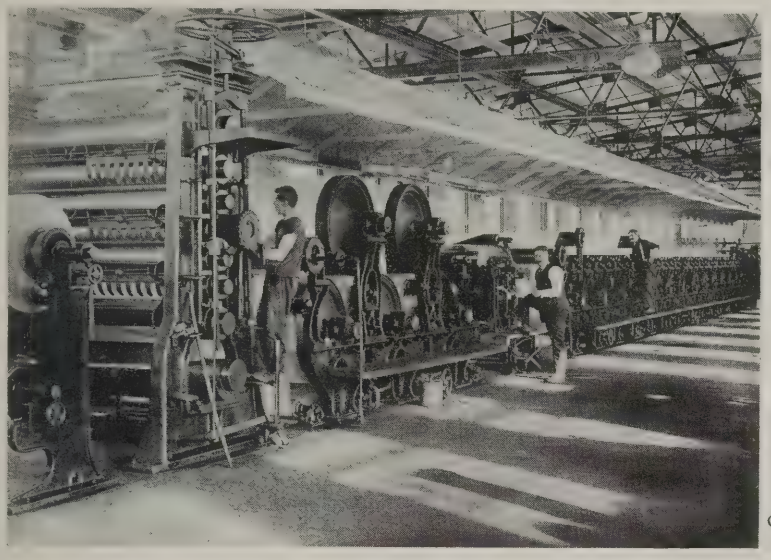
The closing down of the Hedley Gold Mining Company's plant at Hedley, B.C., and the gradual decrease in the gold production from the placer grounds will affect the gold production in British Columbia. This will be counter-balanced to some extent by the production from the Rossland ores of the Consolidated Mining and Smelting Company of Canada, and the renewed activity of several companies who have started operating on the old gravels with improved methods. With the advent of better labor conditions, the Hedley Mines may be able to resume operations.

The Non-Metallic Minerals

Canada has been exporting to the United States during the last few years a considerable quantity of magnesite from Grenville County, Quebec, in the form of crude, calcined and dead-burned. Magnesite is a basic refractory material essential for the lining of open hearth and high temperature electric steel and alloy furnaces. The war having shut off all supplies of Austrian and Grecian magnesite, this new industry was developed and efforts are being made to maintain it now that the European supply is again obtainable. The new plant of the North American Magnesite Company at Calumet, Quebec, has lately been put into operation for the production of dead-burned sinter. Although the Canadian magnesite is much higher in lime content than the Austrian or Grecian, it has been found when properly treated to compare favorably with the latter for rammed or burnt-in linings in the above furnaces.

The introduction of flotation has had the effect of reviving the graphite industry in Canada, and several of the old mills have changed over their methods of operation and installed flotation units as part of their plant equipment. The adoption of this process has simplified the methods of operation; a higher grade product is now produced, with a highe recovery of the carbon content. Th Quebec Graphite Company at Buckin ham, Quebec, have remodelled their mi and are producing No. 1 Flake for cr cible purposes, a product for foundr facings and are putting on to the marke many graphite preparations, such a lubricants, stove polish, and others. Th Black Donald Graphite Company, Cal bogie, Ont., have increased the grade their product by the addition of a flot tion unit. Another plant using flotatio is that of the Timmins Graphite Mine Westport, Ont.

The Outlook for 1921



Canada's future prosperity depend largely on her ability to develop he natural resources. She has vast area of unexplored country awaiting th prospector, the geological formation which is favorable to the disposition minerals, coal, petroleum, and gas. Larg ore bodies of the metals and occurrence of the precious metals have already bee discovered, inviting exploitation and d velopment by capital. There are th silver-lead ore bodies of the Mayo Di trict, Y.T.; the silver-lead-zinc-copper o bodies of the Stewart District, B.C.; th copper deposits of the Alice Arm Di trict, B.C., and the Coast Range; th lead-zinc ore bodies of the Kimberl District, B.C.; the copper deposits a gold occurrences of Northern Manitob the gold areas of Northern Ontario; th iron areas of the Lake Superior Distric the lead-zinc ore bodies of the Gas Peninsula; the coal areas of Alberta a British Columbia; the lignites of Sa katchewan and Manitoba; the oil a gas fields of the Mackenzie River Bas and the Peace River district, and ma others. The unrest and instability foreign countries should result in capi investing in a country where conditio are more stable and favourable.

The steady decline in the world's p duction of gold will have the effect stimulating prospecting, and with an creased labor supply and a lowering c of materials and supplies we can exp an increased production of this preci metal. The metal markets have alrea declined to almost pre-war prices, a with the adjustment of wages and t cost of materials and supplies, the co panies producing base metals will be a position to operate at full capacity.

Expect Renewed Activity

The country as a whole is anxiou awaiting the return to normal conditio and when this time arrives, we can pect a renewed activity in all metallu cal operations. The uncertainty will gone, capital will be able to figure on cost of production, and in this count with its many possibilities, we can co fidently look forward to a new era prosperity, advancement and deve ment.

(Published with permission of Deputy Minister, Department of Min Ottawa.)

PULP AND PAPER INDUSTRY

Mills at Full Capacity

By F. J. Campbell

Canada Paper Co., Limited, Windsor Mills.

THE pulp and paper industry shows little tendency to yield to the era of deflation common in many lines of business, the reasons being that the demand for its products, for the most part, still outstrip the supply, the prevailing prices of raw materials and of wages for labor, together with an almost total lack of accumulated stocks either in the hands of the manufacturers or the consumers. There is a falling off in orders in some lines due to hesitancy on the part of buyers to stock up in what they believe to be a declining market. The universal breakdown in exchange also threatens seriously to hamper the export trade Despite these factors pulp and paper manufacturers in Canada do not anticipate any precipitate liquidation of prices. Reductions, if any, will come gradually, they say, and be governed entirely by conditions of the moment.

Raw materials and wages have been abnormally high during the year. There s some tendency on the part of the ormer to soften, but wages are unlikely o fall to any material extent for some ime, if at all. There is hardly any unmployment in the industry, although oodsmen are more plentiful than for everal years past. The markets for the dustry's products throughout the year ave been exceptionally good and price ovements for finished products showed steady upward trend for the first ten onths. Deflation, as already stated, has en in evidence in a few lines only, but r the more staple products, such as gh-grade pulps and printing papers, prices show little or no recession. In some instances advanced prices will prevail for the first quarter, at least, of the new year. Developments in the export markets, except in the United States, are hampered badly by the existing exchange situation, while even in the United States our export trade is affected by the lower value of European funds as compared with Canadian.

Practically all of the mills have been operated to capacity throughout the year, except where temporary conditions such as low water, have kept down production. The outlook for 1921, with the exceptions noted, is a favorable one with the promise of a largely increased production as the result of new mills and new machinery now being erected or installed being brought into operation. Any prolonged or pronounced period of general depression, however, is bound to be reflected ultimately in this industry as in others, the market for its commodities depending altogether upon the prosperity of business in general.

State of Market Good

By Geo. H. Millen

The E. B. Eddy Co., Limited, Hull.

OUR supply of raw materials is ample. Price trends, generally speaking, are downward, though there are some exceptions, such as bleaching powder and sulphate of alumina, which are much higher, as also pulpwood.

Labor supply has been all that was necessary, but efficiency has not been up to what it was when wages were lower, The latter vary according to trade or occupation, but all are very much higher than they were a year ago. The number of employees is about the same as a year ago.

The state of the market in 1920 for our goods has been A1. During the last two months, however, we have been troubled with low water, in consequence of which our production has not been up to usual and in some cases we have been unable to fill orders. While in some lines, paper for instance, the price has a tendency downward, there are other lines, which we manufacture, which cannot at present be reduced.

As far as our own business is concerned, while very little exporting was done a year ago in any particular line, we have done considerable exporting of newsprint to the United States in 1920. Outside of this there has been very little development in the export field as far as we are concerned.

We are unable to say very much about the outlook for 1921, but it does not look as promising to us as it was a year ago.

Contracted to Capacity

By George Chahoon, Jr.

President, Laurentide Co., Limited, Grand' Mere, P.Q.

PRICE trend in the material going into the manufacture of newsprint paper is pretty stationary; that is, our wood is cut for two years in advance of the time of using. We therefore have on hand about two years' supply of wood on the pile and in the river, and the logs we are making this year are costing fully as much as the supply on hand; other supplies, with the exception of coal, do not materially affect the cost of newsprint paper.

We have sufficient coal, purchased at last summer's prices, to run the mill full until the late spring or early summer. Labor conditions are about normal; we have a very small turnover as most of our employees are local and they are employed in the mill continuously.

We just finished building a new paper mill of capacity of about 150 tons and, with the exception of some classes of skilled labor, we have had no difficulty in securing a sufficient quantity, but there has been no indication of a surplus. There is no unrest with the employees in this industry that I know of; the wages are high and seem to be sufficient to give the men the impression that they are being well looked after.

The markets for the newsprint paper, which is the major portion of our production, have been exceptionally good during the year 1920. The mills have run considerably above their rated capacity. This has also been true of both sulphite pulp and ground wood pulp. The prices have been very regular. We manufacture on yearly contracts; the prices on these are adjusted every three months; we make nothing for the spot market, which is the only portion of the newsprint market that has fluctuated.

There really has been no deflation in the newsprint industry, and personally I

do not believe there is any reason to expect any deflation. The newspapers have been so prosperous these past three years that they have increased the demands made upon the manufacturers until there was not sufficient paper manufactured to satisfy their wants. Undoubtedly, if general business should fall off, there would be some decline in both advertising and circulation, but I feel that this will not exceed the amount of shortage at the present time.

There are no new developments in the export field aside from the present temporary embarrassment in getting payments on export shipments. The reason that there have been no developments is largely due to the fact that the home market consumed all of the paper that was manufactured here. I think, however, the overseas shipments were maintained at about the normal rate.

The outlook for 1921 is good. All of the newsprint mills are contracted up to full capacity and they have the assurance of the publishers that they expect to use the full amount of their contracts.

Seller's Market Coming

By H, Crabtree

Howard Smith Paper Mills, Limited, Montreal.

IN so far as our own raw materials are concerned, there has been somewhat of a slackening during the past two months, but there are absolutely no signs of a demoralized condition setting in. There seems to be a firm undertone, as stocks on hand are, comparatively speaking, very small. Prices have not declined to any great extent, although, in common with all other commodities, there undoubtedly will be lower prices over the next six months than have obtained during this year.

The supply of labor during the past year has been very short, and the efficiency of that labor which was available was correspondingly low, as is only the natural sequence of such a state. The present conditions of labor, in so far as the employers are concerned, is much better, due to the shutting down of a great many industries and the suspension of new construction. Owing to the present uncertainty there is considerably more labor available now than there was at any time during the year, and those employees who find themselves with steady work at this time are very loath to lose their positions, hence are giving better efficiency than they were.

The state of the market for our goods, up to quite recently, was most extraordinary We could not begin to cope with the demand. We still have plenty of orders on our books, although there has been, for some time, a very marked falling off of orders, particularly from the export field. This falling off in foreign markets, however, is largely due to the financial stringency existing in those countries. The prices of our finished product have not been affected as yet, but will follow raw materials and costs of labor.

Large developments were made in the export field during the past year, but, as stated above, we have not been pushing this business for some time, due to the financial position of foreign countries.

Our own view of the outlook for next year is that in February or March we shall see a decided change for the better. It could be summed up that whereas we are now operating in a "buyer's" market, from that time we feel we shall again have a "seller's" market, although we do not believe the peak in prices will be reached such as was attained during this year. However, we believe that business on the whole will be satisfactory.

An Extraordinary Demand

By H. F. E. Kent

Kinleith Paper Mills, Limited, Toronto.

THE supply of raw materials for papers up to the last two or three weeks has been very scarce. This was caused by the unusual demand for pulp from abroad and the United States. Prices of raw materials advanced about 25 per cent. from January to the first of June, and after that date advanced very rapidly within the next two or three weeks from 50 per cent. to 100 per cent. These prices have slightly receded within the last month.

The supply of labor was not good for the early part of the year and it was found necessary, during the month of May, to increase wages about 50 per cent., but since that time, owing to the falling off in other trades, it has been much easier and we are now getting

The Modern Plant and Model Town of a Canadian Paper Manufacturing Company

greater efficiency from our staff than we were previously.

The demand for paper during this year has exceeded anything in the past. In 1916 there was an extraordinary demand for paper, but the demand during 1920 has far exceeded the demand of that or any previous year.

Prices of finished product started to advance the first of the year and by gradual increase had reached by the first of July an increase varying from 50 per cent. to 100 per cent. according to the grade. The level reached by the first of July has held pretty well up to the present time.

The process of deflation in the paper market is looked for, but has not yet started to any extent. However, as raw material recedes in price, the finished product will gradually drop with it and get back to a more normal basis.

During this year there has been no development in the export market. We believe that it will be found that there was less exported this year than in previous years. This is due to the extraordinary demand by the home market, and although at times the mills could have secured better prices for export than they could at home, they did not take advantage of the situation but saw that their own market was taken care of first.

With regard to the outlook for 1921, at the present time there are not many orders being placed, the tendency being to hold off with the expectancy that prices will drop. The mills at the present time have sufficient orders to run them several months ahead, and the only trouble with the holding off will be that when the demand comes, the orders will be all rushed in at once and will create a false market, and prices will increase. If the consumers of paper would order normal requirements and spread out these requirements, the mills are well enough equipped to take care of them, but if every one comes in the market at once, as there is a likelihood that they will, there is going to be a temporary shortage of paper at greatly increased prices.

The Brush and Broom Industry

By L. W. SIMMS

President, T. S. Simms & Co., Ltd., St. John, N. B.

BRISTLES have remained firm in price in spite of the downward trend in many other commodities, doubtless due to two factors. First, there has been no sign of over-supply of brushes on the market, all manufacturers in the United States and Canada being very busy; and, there having been practically no comeback in the way of supplies from Russia, which formed such a large part of the annual production in years gone by, other sources have met with a keen demand.

The past year has seen some very sharp advances in the bristle market. There was more room for them here, in order to bring them up to a level with other prices, owing to the fact that these, as well as other brush supplies, lagged far behind the general advances in the years of the war.

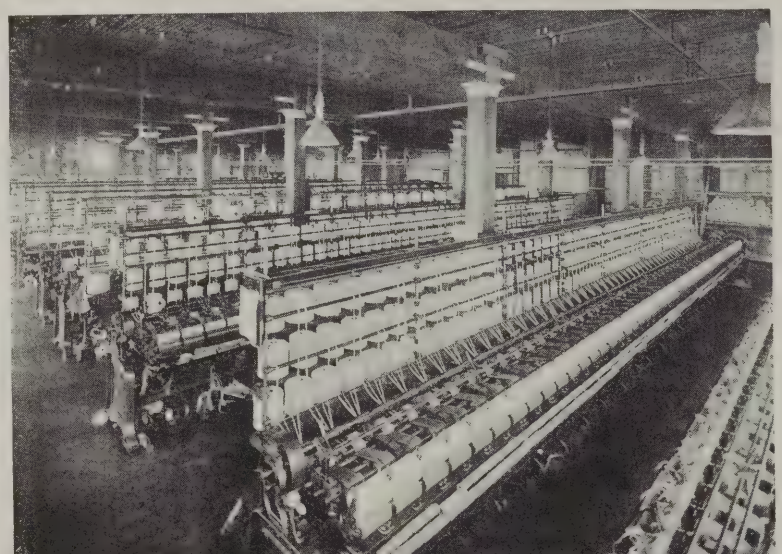
Some of the minor items in the way of the cheaper brush fibres have eased off a little of late, but, as prices of brushes have remained stationary for about six months, these slight reductions have not offset other increases in cost, which have not been reflected in the prices.

The labor supply has become much more plentiful in the last few weeks and, we believe, there is a decided improvement in efficiency as far as the will to work is concerned. Unfortunately, however, we are now beginning to pay up for the long period in which it was impossible to obtain junior employees who would endeavor to acquire a trade, and consequently, the dearth of skilled artisans is becoming more and more acutely felt, especially in those trades such as skilled wood-workers, where men alone can be used.

Wages advanced decidedly and continuously for the first few months of the year, but have remained pretty much stationary throughout this fall.

In the broom business there has been a decided falling off in trade all over the continent, largely due to the fact that brooms seem to be always a commodity in which the trade from the wholesaler to the consumer tends to speculate. That is, if the broom corn crop seems to hold out a probability of higher prices, everybody will stock up all they can afford to stock and the consumer is likely to buy two or three brooms. If, on the other hand, there seems to be any possibility of a decline in the broom corn market, the wholesaler will get down to the last dozen pretty near, likewise the retailer, and the consumer will wear his brooms down to the strings. The latter being the general idea of late, most of the factories, I understand, have been nearly, if not wholly, closed down. Fortunately, we have been able to use any labor not wanted in this department in the brush end of our business, so that no labor has been laid off, both present and future orders in the brush business demanding the exertion of every effort in production. It is generally felt that, as stocks are universally low in the broom business, this industry will pick up materially after the first of the year.

There seems to be little doubt that, just as soon as any activity is manifested in the broom business, the very real scarcity of anything like good or medium quality corn in the hands of the growers or the brokers will decidedly stimulate the price as soon as the manufacturers start buying. The price of brooms is now lower than it has been for some two or three years.



It is difficult to forecast the prospects for many months in advance during these times, but if one may venture to do so for the period from now to early spring, appearances seem to indicate: first, in corn brooms—the weather conditions having been exceedingly bad during the harvesting of the crop in the Middle Western States, there probably will be a good deal off-colored and damaged corn available this year, which will make it possible to offer a cheap off-colored broom at low figures throughout the season. There seems to be no doubt, however, that a medium or good broom will not be any lower than it is at present and that there is every prospect that an advance in price will take place as soon as the activity following on the exhaustion of stocks, already very low, compels the manufacturers to start purchasing again.

Second—Brushes. The largest field in this line, especially in Canada, is probably in paint brushes. This is largely controlled by the amount of painting done. It is well known that there has been more painting done this fall in most localities than has been the case for several years. Painters inform us that they have had to carry over the winter many orders for outside painting, which the owners had hoped to have done this fall. In spite of the increased activity along this line, the country is still in crying need of paint, much of the property having gone far beyond the point where economy demanded attention.

In many industries, such as in the paint line, increased demand could be fairly rapidly met by increased production through mechanical means. In the brush industry, there still being a very large amount of skilled hand labor necessary, it has not been possible to meet increased demand by rapid increase in production; consequently, in spite of the fact that the industries in this field are all busy, there seems to be no sign of an over-supply anywhere, but on the contrary, we are no exception to the rule in that we have still several months' business on hand, which is a normal condition at this time of year in the brush business in anticipation of spring activity.

It would seem, therefore, that with the bristle market remaining firm, with activity everywhere manifested in the industry, and in view of the fact that the spring is always the keen time of demand, there is very little likelihood of any downward trend in prices, at least until next summer.

Demand continues good from the export field, although temporary financial uncertainty is a factor in the situation.

THE TEXTILE INDUSTRIES

Anticipates Healthy Revival

By R. G. Tolmie

Canadian Cottons, Limited, Montreal.

THERE has been a steady decline in the price of raw cotton during the past four or five months, which has had the usual unsettling effect upon trade. The cotton crop in the United States is larger than it has been for several years. This, coupled with the almost universal curtailment in manufacture, will assure an adequate supply for mill requirements this season.

Labor conditions are easier than they were a year ago. There is now an abundant supply of unskilled labor, but there is no surplus of experienced operatives. Wages remain at the highest point in the history of the industry. Full time employment has been the general rule throughout the cotton industry in Canada, in contrast with short time that has prevailed in many mills in the United States and in Great Britain.

The demand for goods during the first half of 1920 was in excess of production, and forward orders placed at that time have helped to keep our mills operating during the past few months when a marked falling off in new business was noted. Mill prices of finished goods have declined in keeping with the reduced cost of raw cotton, and are now at the lowest level which present cost of production will permit. We are, however, inclined to look for some further liquidation by retailers with whom revision of prices downwards has not kept pace with mill reductions.

With a return to normal prices, we now look forward with every confidence to a healthy revival in business conditions in 1921. The world's shelves are really bare of goods. Manufacturers cannot afford to take chances, and are curtailing production of anything but goods actually sold. Meanwhile consumption by the general public goes merrily on, and although undoubtedly restricted by a certain amount of unemployment, this consumption has been exceeding production. The ultimate outcome is obvious.

Deflation almost Completed

By H. Quarmby

The Guelph Carpet & Worsted Spinning Mills, Limited, Guelph.

CONDITIONS in both carpet manufacturing and worsted yarn spinning remained satisfactory until about two months ago, when the slump which commenced in the United States during the early summer made itself felt in Canada and business people lost confidence, with the result that buying practically ceased. We believe, however, that price deflation has almost been completed, and we are looking forward with confidence to the New Year, when a large business will doubtless be done on a lower price basis.

Wages increased 15 per cent. during 1920, but it is difficult to believe that this level can be maintained in view of lower prices prevailing everywhere.

We are firmly of the opinion that the supply of merchandise has not caught up to the demand but the difficulty of financing has made it almost impossible to trade with many of the European countries. If a satisfactory financial policy could be formulated whereby business could again be transacted with such countries as Russia, Belgium, France, Roumania, Greece, etc., we believe the demand for goods would surprise the most optimistic business men.

Conditions are Reversed

By W. Tinker

Canadian Woollens, Limited, Peterborough.

CONDITIONS in the woollen trade this year are practically a complete reversal of conditions prevailing last year at this time. There is a very plentiful supply of raw material from all sources, with prices at a very low level. It is rather difficult to determine how low prices are, for no business (except a little for immediate use) is passing at this time, but there are some very substantial reductions.

The supply of labor is all that could be desired. Wages are on the same level as last year, but if present signs are read aright, there is a reduction due in this connection in the very near future. Efficiency of operators has increased owing to the fact that the labor supply is very plentiful. At the time of writing, employment in the woollen industry is very good. A few mills are working short time, but practically all employees have been retained with the view of assisting them over this difficult period. Many mills are working full time, and have prospects of continuing same for a few months.

For the first eight months of 1920 the demand for Canadian-made and imported woollen goods was exceptionally brisk, and manufacturers could not supply the demand. After that time, however, the demand slackened considerably until it is practically non-existent at this time. (Dec. 1.)

The prices of finished products have moved towards lower levels in sympathy with raw materials. It is exceptionally difficult to state whether the process of deflation is complete, but it seems to be the general view among the trade that prices have not yet reached the lowest levels. The feeling that spring will see the revival of business is probably correct.

Very little development is taking place in the export field. The Canadian Woollen Mfrs.' Association have travellers in different parts of the world, but nothing material in the way of orders has developed. An order from Roumania for several million dollars' worth of goods has been hanging fire for several months, and nothing definite has transpired to the time of writing. A large order for the Greek Government has also been spoken of, but the recent change in internal affairs of that country would apparently stop all negotiations for some time in connection with this.

The year 1921 should be a splendid year for the cloth and yarn trade as a whole. One of the largest crops which the Dominion has seen has just been marketed. The money to purchase goods is in the country, and although prices

will be lower in the future, business should improve very materially by spring. The main point, to which too much emphasis cannot be given, is that everyone should fulfil their obligations in every respect. Although the meaning of the Golden Rule was expounded thousands of years ago, its observance and application to-day would put business upon a splendid footing immediately.

The Linen Industry

By Wm. Berry

Dominion Linens, Limited, Guelph.

THE supply of raw material, both flax and cotton, is ample, and we think that cotton has struck the bottom for this season. With reference to flax, this is lower in price that last year, and we think that lower prices will still be seen in flax as soon as the flax mills offer their 1920 crop.

We are able to secure all the skilled help required for the operation of our plants, and no reduction in wages has been made. As far as we can see we will be able to run our plant full, and we do not expect to lay off any employees.

The market for our goods during 1920 has been excellent, and we have been unable to take care of all the business offered. Price movements have been normal during the year, but on account of lower raw material prices, reduced prices will be put in effect for 1921. We expect the new price list now being issued to be the prevailing price during 1921.

As to the outlook for 1921, we have a large amount of unfilled orders, and as merchants generally are curtailing their buying in foreign markets, we believe this will result in increased business for our company, when they replenish their stock.

Evil of Cancellation

By Woollen Manufacturer

THE outlook for 1921 is very hopeful if the trade as a whole will not show any panicky feelings. A few words at this time regarding the selfish methods recently adopted by many of the large wholesale houses and clothing manufacturers would be very timely. Nothing in the opinion of the writer so tends to disorganize business and create a panic as the drastic cancellations which have been pouring in on woollen manufacturers, and yarn spinners during the past three months. In the majority of cases there are absolutely no reasons for such cancellations, except an effort to avoid obligations on the part of the concerns placing orders.

During 1919 and the early months of 1920, contracts were entered into upon the same basis as the previous five years. High prices were paid for raw materials, high priced labor transformed these raw materials into finished goods, and without a word of warning these orders were cancelled, and clothing manufacturers and jobbers refused to accept deliveries.

Various reasons were advanced for this action, but the real fact remains that we are now having a falling market, instead of a rising one as has been the case for the past few years, and the clothing manufacturers and cloth jobbers expect that the goods which they cancelled can be purchased at a lower price in the near future. It is a very deplorable state of affairs and reflects no credit on the concerns which are sending in cancellations.

Unfortunately, however, this state of affairs is not confined to Canada. The United States and Great Britain are passing through the same trouble.

There are, of course, exceptions to the above, but the cloth trade as a whole is hurrying for cover and throwing everything back upon the cloth manufacturers and yarn spinners. If all concerns accepted delivery of their contracts there would be no panic. Every concern would then bear its just share of the loss necessary to deflation.

It seems a great pity that there are no courts in existence where manufacturers could get these matters settled without delay. If the Canadian Manufacturers Association could form a committee to which manufacturers and merchants could bring their cancellation troubles, a very great benefit would be conferred upon the trade.

Will be Quick Recovery

By Cotton Manufacturer

THE state of supply of manufactured goods in our lines is not very large, as production has been largely curtailed and consumers and manufacturers have not been making purchases. The result has been in our case, that we have discontinued night work entirely and are about to arrange to largely reduce regular day work. Prices of raw cotton, in my opinion, have about reached the bottom and within a short time will be advanced considerably. I anticipate quite an increased demand for goods in our lines within the next month or two, not only in Canada, but in the United States. The natural result will be more demand for cotton and, therefore, increased prices.

Supply of labor at present is ample; in fact there are hundreds of hands out of employment. This results, naturally, in increased efficiency. I estimate that at the present time five hands will do the same work that it required seven hands to do during the past several years. They all know now that they have got to scratch gravel. We have been weeding out the drones and replacing them with more reliable and efficient hands.

We have reduced wages during the past two weeks 15 per cent., and further reductions will be necessary unless trade conditions improve at an early date. Incidentally, we have also reduced our office staff by several hands, but this is the limit as far as that is concerned, as we are now down to the minimum necessary for conducting our office business satisfactorily.

The state of the market for our goods during 1920 was excellent up to October, when the landslide began, and since then there has been practically no demand for goods in our line, but my opinion is that the less the demand at the present time and the longer the present slump continues, the quicker will be the recovery. My opinion is that by February and March we will have quite a revival in business. As soon as cotton advances and consumers and manufacturers hear of others in their lines beginning to purchase they will all jump in for fear they will get left and not be able to obtain their supplies for later requirements.

I believe the process of deflation in our lines has been completed. This deflation would not have been so acute in Canada if it had not been for certain United States manufacturers in our lines slaughtering their goods in order to raise money. In many instances these goods have been sold much below present cost of production, but this condition cannot continue much longer.

My view of the outlook for next year is optimistic. The present deflation has resulted in everybody withdrawing from the market and has caused a scarcity of goods, and I believe that the reaction will take place at an early date. Nobody is wearing fewer clothes than formerly and the retail public are buying about as much cotton goods as ever. However, the time will come at an early date when the supply will not equal the demand, the natural result being that prices must advance and manufacturing be resumed.

The Knitting Industry

By J. A. Burns

The Monarch Knitting Co., Limited, Dunnville.

OUR volume of business during the year 1920 considerably exceeded the previous year. A small percentage was for export, but the great bulk of our business was for home consumption.

Conditions as regards raw material have entirely changed since the early months of 1920, and to-day raw materials can be purchased at very attractive prices. It would seem to the writer that the bottom has been reached in cotton and wool, and it is likely that as soon as business opens up the first of the year, prices of these commodities are likely to advance.

With regard to employment in the knitting industry, I would say that during the year 1920, every available person has been employed up to the first of November, and if business opens up the way it should at the first of the year, we do not anticipate that there will be any unemployment in the knitting industry. This, however, all depends on the wholesalers and merchants being willing to anticipate their requirements. We believe

that they will be wise in doing so, as prices have been reduced to correspond with the reduction in the cost of raw materials, and during the next six months we are of the opinion that raw materials are more likely to advance than decline. We, therefore, believe that the process of deflation has been completed as far as the manufacturer is concerned.

Goods Soon Needed

By C. F. Fell

Hamilton Carhartt Cotton Mills, Limited, Toronto.

IN the past three months of the year all raw materials have been much easier to secure, and prices much lower than the previous nine months. As regards the supply of labor, there is at present a surplus, and while we have made no changes in rate of wages paid, still feel those who we now have are far more efficient, and are producing more per day than formerly. December being one of the quietest months of the year, we anticipate a revived business early in the new year.

There has been a reduction of 20 per cent. in all our product and we do not look for much further declines, owing to raw cotton being sold at a lower cost than can be purchased, and we anticipate that as soon as the demand is greater, cotton will steadily advance.

As to the export field, the only thing holding orders back is financial backing. During 1919 we were fortunate to do a lot of export business owing to the Canadian Trade Commission arranging credits, but since this has been dropped, very little has been sent abroad.

As there has been very little doing in the past three months, we believe that in the course of the next sixty days a great deal of merchandise will be needed, and this will tend to start the wheels of industry again moving, and with the consumer renewing his purchases, the retailer will have more confidence, and will continue making his usual purchases. There will be a scarcity of some lines and naturally this will show higher prices.

Prices in Canada have never reached the high peak that they did across the border, so that they cannot go as low in proportion, although the individual doesn't realize it.

Market has been Good

By J. B. Carter

Eclipse Whitewear Co., Limited, Toronto.

THE prices of Canadian white cottons entering into our productions have been reduced about twenty per cent. on the 1st November of this year although our English lines are higher at the present time than they were a year ago and deliveries are impossible. There has been no change in wages for week workers or piece workers during the year. There is no indication that there can be any changes at the present time in employment.

The market for the year 1920 has been exceptionally good up until the 1st November, when there was a slight falling off. Price movements have had little change.

Regarding process of deflation, we believe it is only temporary. In different interviews with many of the large retailers throughout the country, their sales are well up and in many cases ahead of last year, but as they have been buying heavily in the past, they find their stock large and as the present-day prices require much more capital to finance, they have stopped buying with the hope of reducing their stock. That is where the letting up of a large volume of business is taking place, rather than between the purchasing public and the retailer.

The outlook for 1921 is a difficult matter to express an opinion on. With the very large crops that we have had in Canada and the prices they are getting for same, there is no reason why the purchasing power of the public should not keep up to a reasonable point of power with 1920. There is no doubt that there is a great shortage in many of the countries of Europe, and as soon as they get in a stronger financial position there will be market for large quantities of merchandise.

Quick Return to Normal

By H. G. Smith

General Manager, Mercury Mills, Limited, Hamilton.

RAW material is in good supply just now, but in some respects the quality and the way in which the materials are prepared are not up to pre-war standards. Until the present time the trend has been decidedly downward as regards price, but cotton has now stiffened appreciably, and we think that fine wools, being scarce, will not go any lower, and may even go higher. Coarse wools, in the opinion of the writer, can hardly go lower than they are now.

There is a better supply of labor at the present time, and the efficiency is undoubtedly higher. Wages remain at the top point so far. We are still employing our full staff, but unless the demand for goods increases quickly it will undoubtedly be necessary for us to reduce the number of employees.

For the first six months of 1920, the demand for goods was extremely brisk, but since then it has been tapering off rapidly until at the present time it may be almost stated there is no demand. Prices on finished products in our line have been radically reduced, and in our opinion the process of deflation has gone as far as is safe at the present time.

Export demand has been stopped for the moment, and we think the chief reason for this is that United States manufacturers have reduced their prices so many times that buyers are afraid to operate.

As regards 1921, it is a very difficult matter to predict, but should the public regain its confidence to the extent that normal buying is resumed, we believe the results will be entirely satisfactory from every point of view. In our opinion the fact that buyers absolutely ceased operating some time ago, and practically no new business has been placed, points to a more or less quick return to normal; in other words, if the decline in business had been gradual, we would look for the improvement to come gradually, but as the decline was so sudden and so complete, we think the improvement is apt to be just as sudden.

Men's Neckwear Industry

By A. T. Reid

A. T. Reid Co., Limited, Toronto.

MEN'S neckwear, made of broad silk and that of the knitted variety from artificial and spun silk, has been in particularly good demand during the whole of the past year. Of recent date, say during the last three months, the neckwear manufacturer in either of the above departments has experienced, like producers in other lines, a strong tendency on the part of the retailer to cancel orders and in too many cases, to return merchandise shipped as a result of bona fide orders.

During the early part of the year and until the sudden slump in business, the demand for labor was well maintained. Wages remained at the highest peak with efficiency in quality and quantity of work failing to keep up the same plane. Toward the end of the year the lessened demand for labor had a tendency to increase efficiency, and absenteeism, which during the press of the early part of the year was so prevalent, was noticeably less and practically ceased entirely during the last few months of 1920. The prospect for the future as seen from our industry is that possibly fewer people may be employed but the prevailing rate of wages will be maintained.

During the early part of 1920, and indeed up until the announcement of the budget speech, which included the immediate operation of the luxury tax, the demand for merchandise was excellent. Since, however, the luxury tax became effective, business has been most restless uncertain and chaotic. Its many defects and glaring inconsistencies irritated and befogged both retailer and consumer and paralyzed buying on the part of all. The daily press unfortunately, instead of helping to stay or allay this feeling of fright and hesitancy, published much that increased and magnified these unfavorable conditions.

Prices of some materials, such as silk show a definite tendency towards a decline. Perhaps this is more marked in the case of silk than in cotton materials. We are not of the opinion that the process of deflation is yet complete, although there will unquestionably be increased prices over to-day's quotations, which prices have been made through quantities of distress material having been thrown on the market regardless of cost. The process of readjustment has been painful

and most acute, but perhaps normal conditions will obtain the sooner because of its severity.

Following this thought, we are strongly of the belief that 1921 in most departments of the textile trade may show by comparison with 1920 a definite lessening both in volume and prices. We are hopeful, however, that by the opening of the autumn season business will have become more normal, steadier, and transactions will revert to a surer and sounder basis. One of the encouraging features is that in only a few cases and in a minor number of departments is overstocking general with the retailer.

Orders to be Smaller

By James Moodie

J. R. Moodie & Sons, Limited, Hamilton.

DURING the past twelve months quite a reduction has taken place in price of raw materials used in the manufacture of ladies' and children's underwear (but this reduction is only of recent date). At the same time it is a very easy matter at present to obtain delivery of materials of all kinds; the supply is greater than the demand.

During the past three months the supply of labor has increased considerably. Owing to many factories in the textile business operating on reduced hours and in some cases factories having closed down entirely, the supply of labor is naturally much more available than it was even six months ago. Wages have not changed at all and it remains to be seen if the shortage of business will not bring about a reduction in wages, as they are at the present time.

We are unable to make a statement as to what business will be for the coming year. It is very hard to say. We will be in a much better position to answer this question along about the middle of January. We feel, however, that orders will be very much smaller than they have been during the past few years. This means our production will be reduced considerably.

The market for our production during the year 1920, was very good up to the month of September. From September on we have had no business worth speaking of and in a great many cases orders for fall delivery have been cancelled. Quite a reduction has taken place in the price of ladies' and children's underwear, this change being brought into effect December 1st.

The Underwear Industry

By Ontario Manufacturer

OUR supply of raw materials has been good. The trend of prices has been downward, but I think they have about reached bottom. Labor supply has been much below requirements and about 75 per cent. efficient. Wages have been increased. The present state of employment is normal but there may be some reductions in the early part of January.

The market for underwear during 1920 was very good, with price movements in finished products downward. I think the process of deflation has about run its course. The outlook for 1921 is fair, but I expect business to be later than usual in opening up.

Conditions in the Shirt and Collar Industry

By F. W. STEWART

Cluett, Peabody & Co. of Canada, Limited, Montreal

THE condition of the cotton market, as regards both raw cotton and piece goods, is so demoralized and uncertain it is not possible with any degree of assurance to give an opinion as to the state of supply and trend of prices. Raw cotton is being sold at prices considerably below cost of production, and this applies also to piece goods on hand for immediate delivery, and it is difficult to secure any prices for future contract, except at some advance over spot quotations. As present supplies become exhausted, which will likely occur during the first two or three months of the new year, a demand for merchandise will no doubt be created, which may not be easily supplied, as experience of the past has shown that when buying begins after a period of depression, the demand very soon becomes greater than production can supply, which creates conditions which are always undesirable in merchandising. Canadian mills are still much behind in deliveries of certain qualities, and it will likely be well after the New Year before they will be in a position to catch up on their orders.

There has recently been a marked improvement in efficiency, and no doubt present conditions will tend to strengthen this improvement. The supply of labor has been ample to cover our requirements during the year, and will continue so for some months to come. All our plants have been working to full capacity up to the present time, but some departments are slowing down, and production in these departments will be curtailed for several months, until such time as it is necessary to again operate to capacity.

The market for our production during 1920 has been entirely domestic. Price movements were upward during the first ten months of the year, but have been downward for several weeks, and will likely stay at to-day's level for some time, as the reduced prices in many qualities, as compared with the highest, have been quite drastic. Deflation of prices has presumably nearly reached its limit, and we will be fortunate if prices do not trend upward, when the general demand for merchandise is again felt, as many qualities are being sold at considerable loss, which condition will tend to disappear when merchants are again in the market.

The outlook for the year 1921 is not of the brightest for the early months of the year, but the tendency is that by April, stocks in all lines will be very low, as retail merchants have not been purchasing to any extent for several months, and production has been very small in most lines of industry, many factories being partially, or entirely, closed down for quite a long period.

Continuous depletion of stocks will certainly create conditions which will mean more purchasing of merchandise during the spring and early summer months. The non-production of a lengthy period will necessitate the operating of plants on full time, and these conditions will quickly inspire confidence, and will no doubt result in the return to prosperous conditions before the year passes out.

The features which will go largely to create confidence in the public mind, are first—a knowledge by the consumer of the actual conditions under which industry is being operated to-day, and that to maintain properous conditions industry must not be so affected by the action of the public that our industries cannot operate on full time, thereby preventing steady employment and full pay envelopes; secondly, employers must continue to work towards bringing their employees into closer touch with the operations of the industry in its many phases, which they are connected with, thereby creating that confidence in each other which should prevail between employer and employee, and bringing about the co-operation between all which is so necessary for the success of all industry. Such efforts should not be lessened under present conditions, but should be increased to a greater extent in the future than at any time in the past.

The Corset Industry

By E. W. Mills

Crompton Corset Co., Limited, Toronto.

OUR supply of materials are coming forward quite freely with quite a decided reduction in prices. The labor supply has also improved, and we are now having no difficulty in getting all the operators necessary, although they were very scarce during the early part of the year.

The condition of the market during 1920 has been very favorable to the manufacturer, as it was practically impossible to supply the demand. While prices have been reduced, to a limited extent, there is every prospect of further reductions as soon as we are in a position to take advantage of some of the lower-priced materials which are now coming to hand.

The outlook for the coming year appears to us to be very favorable, as the majority of retailers have no excessive stock of our class of goods.

FLOUR MILLING INDUSTRY

General Review

By A. E. LABELLE

St. Lawrence Flour Mills Co., Ltd., Montreal

THE milling industry has only been decontrolled on the 1st of September last and it will require a good deal of readjustment, like every other industry, before things become normal. New conditions have been created, which will have to be met.

The end of the control period has been very disastrous to the milling industry. Conditions were created by the Wheat Board that forced the mills to operate at a loss from the 1st of February to the 1st of September last. Few, outside of the mills, are aware of what took place and I do not propose to take any of your space nor any of your readers' time to go through the unfortunate past conditions. I think that the words of one of my prominent confreres in the milling business will cover the whole situation: "The most charitable thing we can say about the Wheat Board is to forget it."

Let us hope that this control will never occur again in Canada. It has done no one any good and in the end practically hurt everybody.

The public, in general, is not aware that the milling business is not protected in any way, by any customs tariff. In 1917, an Order in Council was passed placing wheat and wheat products on the free list in the United States and Canada. At that time, it did not matter because everything was controlled and no American flour was brought into Canada and no Canadian flour was exported to the United States; but since the 1st of December last all this control and embargoes have been removed and the reason why so little business has passed between the two countries has been due to the exchange, which makes American flour much higher in Canada than Canadian flour, but this position may change any moment, and I consider that it is necessary that the milling business should be put on exactly the same basis as other industries, seeing that the result of the recent enquiry by the Tariff Commission shows that this country is fully alive to the importance of every one of our industries being protected in a satisfactory manner.

Prices of wheat and flour have been gradually coming down since the first of this year's crop has been marketed. This decline has been quite serious, amounting so far to $4.25 per barrel, from the price we were at the end of the wheat crop. Of course, what the future will be, no human being can say. Still, we all expect that normal prices will prevail, although it may take two or three years of good crops to put down wheat prices to what they were before the war.

Through circumstances, for which the mills were certainly not to blame, the export business has been a very unsatisfactory one since the beginning of the year. This is a problem that is having the millers' full attention at the present time, as the milling industry in this country, not only for its own good but also for the good of the country at large, must sell a large proportion of its output for export. It is true that new countries are buying from Canada, and some of these will prove to be very satisfactory customers, but on the other hand, some of the old flour importing countries, who were giving Canada a large share of their business, have now turned to other channels. Owing to the conditions during the war, some countries who never milled flour started milling, importing the wheat from wherever they could get it to best advantage; after a little while, these same countries started exporting. For instance, there has been a lot of Chinese flour sold in England during the war and since. This displaces so much Canadian flour.

The present capacity of Canada is about 30,000,000 barrels a year. The domestic trade does not consume one-third of that quantity, so this will give the public an idea of how much has got to be exported. If the mills were grinding only what they require for the domestic trade, there would not begin to be anything like the quantity of mill feed produced by the mills for the requirements of the meat and dairy industries, so that every one can easily see that all these different industries are linked together. If we export lots of flour, then our farmers will be able to raise lots of cattle, not only for the domestic requirements but a very large exportable service, which is all bound to help to build up a country. This will also result in more employment, lower costs and lower prices to all Canadians.

The mills have had otherwise a very satisfactory operation, that is their labor conditions have been good and the supply of wheat of the usual excellent quality. We are admirably situated in Canada for this; we grow a better class of wheat, that is recognized the world over as being the highest quality; starting on that basis, we are bound then to have the very best products, both in flour and feeds.

Notwithstanding the experience of the last few months, I think the mills can reasonably look to a good business during 1920-21. Of course, price of wheat will have to come down to such a basis as will compete with the prices of other countries on our export business, but a good deal of work will have to be done in order to push the export of flour, which is absolutely vital to the milling industry. I am also convinced that before many months have passed, flour mills must be protected like every other manufacture in this country, otherwise it will be putting the mills in a very bad position. This should be borne in mind by our Government.

Outlook is Hopeful

By D. A. Campbell

Maple Leaf Milling Co., Limited, Toronto.

THE Canadian Wheat Board, who have controlled the milling industry in Canada for the past twelve months, relinquished control on September 1, 1920. The mills are now free agents, as they were prior to the war.

The option markets in Winnipeg have been re-opened and there has been a

steady decline in the price of wheat from the high price of $3.50 per bushel, which prevailed in July, 1920, to a price to-day (December 1) of $1.55 for delivery of wheat in May, 1921, on the option market. Along with all commodities, wheat seems to be seeking new price levels.

Labor has been scarce and rather difficult to handle during the past year. Wages have been high. At the present time, owing to a general slackness in the industry throughout Canada, labor is not difficult to obtain. There has been no change in the rates of wages as yet.

The outlook for the industry is hopeful, although the mills have not been busy during the last three months. England is waiting to see how the Argentine and Australian crops are going to turn out before she definitely commits herself to a heavy purchase of North American cereals. The big bulk of the exports of wheat and flour from Canada goes to the United Kingdom, and with this buying power withheld from our markets, prices will sag owing to the weight of deliveries. The Englishman is determined to get his wheat this year at a much lower level. Coupled with this, no doubt, there is a feeling that he has paid too much for wheat and flour for the war period.

Situation more Healthy

By Geo. A. Macdonald

The Quaker Oats Company, Peterborough.

SUPPLY of raw materials for our requirements has been free throughout the year and price trend has been sharply downward. The supply of labor has been sufficient; efficiency has been fairly good throughout the year. Wages were advancing during the first half of the year and since then have remained about stationary. We are now employing about 60 per cent. of labor as compared to full run basis.

Market conditions during 1920 have been very unsettled owing to rapidly changing conditions. Price movement on finished products has been very sharply downwards during the last half of the year. We are inclined to feel that the process of deflation, as far as cereals and cereal products are concerned, has just about been completed and are looking for an advancing market in these products during the first half of 1921.

Developments in the export field have been unfavorable owing to the desire of importing countries, wherever possible, to take the grain and do the manufacturing process in their own mills.

We are inclined to look hopefully forward to 1921. While there are, in our opinion, many troubles to overcome ahead of us, we are inclined to be optimistic because the radical downward movement on all commodities during the last half of this year has made the actual business situation more healthy and sound. During the process, which has been painful for most all of us, the unsound business man in all lines has perforce had to be eliminated. The high-flying, speculative class of middlemen that worked into business during the period when everything they touched advanced in price, has disappeared and the sound and sane manufacturer and business man in all walks of life is left. There is, therefore, less likelihood of a rapid reaction carrying business off its feet for the second time. We are not looking forward to large profits being made during 1921, believing that as large a volume of business should be gone after as possible on a basis of the smallest margin necessary for safety. We do not look for labor costs to decline in any such proportion as manufacturers' margins, and feel that owing to the topsy-turvy nature of values now entering into the cost of living, great care and thought will require to be exercised by every manufacturer in the adjustment of wages to a basis that will fairly meet the deflation that has so far taken place.

To sum matters up, we do not look for smooth sailing in 1921, but feel that the situation is quite hopeful for the manufacturer who operates efficiently and in so doing employs as much labor as possible to produce the maximum turn-over at the lowest reasonable margin of profit.

Conditions in Oil Refining Industry of Canada

By S. R. PARSONS

President, The British American Oil Co., Limited, Toronto

CRUDE petroleum, which is our raw material, largely imported at present, has during the past eighteen months risen to unparalleled price levels owing not only to the intense competition for crude oil but the necessity for deeper wells, the materially increased costs of drilling, and other enhanced charges of producing operations. There has been on this continent an appreciable scarcity of petroleum in all forms so that, while extraordinary prices have prevailed, the problem to-day is not the price of petroleum products, but the availability of these essential commodities of modern commerce. It is quite possible that the sources of supply in the Old World will shortly assume a more normal condition, making unnecessary such large exports from United States and Mexico to supply European needs. There is always the hope, too, that we will find large pools of crude petroleum in Canada. With the possible slowing down of industry to some extent on this continent the demand may possibly be more easily met in the future and thus lower prices prevail.

In the oil refining industry processes and equipment are proportionately of larger importance than in many other lines of manufacture, thus the volume of labor is relatively smaller. Our supply of labor has of late been both sufficient and efficient. Wages are at their highest point at present and will not likely decline unless there is a return to lower levels of prices in general living conditions.

Our lines being of a staple character required for diversified purposes in industry and agriculture, we do not anticipate a falling off in the volume as compared with the past year.

The export market is only of interest to Canadian refiners when they have surplus lines to offer, as in view of the fact that their raw material is imported they find it difficult to compete with American refiners for export trade. Should crude oil be found in large quantities in Canada, the refiners are also thoroughly equipped that they could then handle export business to great advantage.

Broadly speaking, the outlook for general trade appears to me to be promising. Stocks in the hands of retailers are quite limited in most cases. The products of the farm yet to be sold, it is to be hoped, will bring good prices when once conditions are a little more settled. Canada, with her great stretches of agricultural lands, her stores of raw materials, her great lumbering, mining, and fishing interests, and her well-equipped industrial organizations, with the expectation of a fairly large immigration of the right character, should have very few dark days ahead. If her citizens are fair-minded towards each other, courageous, hard-working, and thrifty, we should experience little difficulty in meeting our great national obligations. To this end, however, all classes of the people should be helped to a state of prosperity as far as possible. This, I believe, to be the aim of our national government. No country can meet great obligations with falling revenues. It would not be hard to dry up many of the sources of our national wealth if some interests that are particularly vocal at present had their way.

The Wire Rope Industry

By F. H. Hopkins

Dominion Wire Rope Co., Limited, Montreal.

SUPPLY of raw materials has been much better, with trend of prices lower. The supply of labor has also been better, though efficiency has not improved much and wages are higher. We have had no difficulty in getting employees.

The market for our goods has been much reduced. Prices have been materially reduced, with tendency for slightly lower prices. We believe that prices will be lower for 1921. The outlook is not as promising as it was a year ago.

Had Increased Output

By Clayton E. Hurlbut

The Hurlbut Co., Limited, Preston.

THE state of supply of raw materials is free and prices have had a marked downward tendency. The labor supply, excepting female labor, is good and wages and efficiency are both high. We are operating under the industrial committee plan.

The present state of our own business (Dec. 1) is good, but nothing is in sight for January. Conditions for spring do not look bright at this time. Conditions during 1920 were good and our increase in output over 1919 will amount to $100,000. Prices of finished shoes have been downward.

The outlook just now for 1921 does not appear good, but I believe that we in the shoe line have touched bottom and I look for business to assume pre-war normal proportions during the latter half of the year. Fall business should be good as retail and jobber stocks should be well reduced by that time.

Back to Normal

By D. Marsh

Wm. A. Marsh Co., Limited, Quebec.

THE raw material market during 1920 has passed through a period of violent change. In the earlier months of the year there was still an apparent scarcity of materials and prices held at a high level. With the enactment of the luxury tax, however, liquidation set in and prices have since dropped sharply, until to-day they are really lower than there is any warrant for. The experience has demonstrated that there were actually larger stocks of materials on hand than had been anticipated.

Up to about the first of October employment in the boot and shoe industry was good but since then there has been a decided drop, with shoe factories averaging only about ten per cent. of capacity. The labor shortage experienced earlier in the year has been completely reversed and there is now lots of labor available. Wages were generally advanced early in the year and are still nominally at the high point.

The market for boots and shoes has declined from an active demand to one of almost complete stagnation. Buying is to-day entirely of the hand-to-mouth variety and there has been very extensive cancellation of orders. It is noticeable, however, that retail business is still quite active, the evident desire of the trade being to liquidate present stocks as far as possible, while awaiting further reductions. The result of this will undoubtedly be to occasion a rush to fill orders when the shortage becomes acute, and it will then be a question whether manufacturers can supply the goods.

The most favorable aspect of the situation is that people are getting back to their senses. They will now begin to order goods in normal quantities and better methods of salesmanship will be employed. This will tend to place the shoe trade on a more satisfactory basis.

Taking Heavy Losses

By Shoe Manufacturer

THERE is now a full supply of raw materials and price trends are mostly all downwards. The labor supply has been ample, with efficiency slightly improved. At present the shoe industry is in bad shape and the supply of labor greatly exceeds the demand.

The market for goods during 1920, particularly since May or June last, has been falling off. The luxury tax has been, we believe, the strongest contributory cause to the decline. Prices have been gradually dropping and are based upon replacement values of raw material, which means that we are making a heavy loss, owing to all raw materials on hand having been purchased at top prices.

The process of deflation is not complete. There are a great many items entering into the manufacture of shoes, some of which have not yet shown any deflation in price, but price of the bulk of materials and the price of the average lines of upper leathers has been greatly reduced; sole leather not so much.

Re export development, this is out of the question. In all probability England will take advantage of the exchange situation and export shoes to Canada; in fact a movement has already started, and what would tend to make it worse is the basis of paying duty on the value of paper currency.

We are unable to express very much optimism. We do not look for any marked improvement in the shoe business within twelve months.

Improvement at New Year

By Geo. A. Blachford

Blachford Shoe Mfg. Co., Limited, Toronto.

THE shoe manufacturing industry during 1920 has gone through a period of great upheaval. Up to May of this year business was good, although the placing of fall orders during the month of April indicated that the retail trade was showing commendable caution, and the volume of placing orders given indicated a curtailment in purchases. Coincident with the imposition of the luxury tax, trade practically stopped, only to be followed by a deluge of cancellations and return of merchandise, resulting in a long period of general stagnation at the factories. The recent usual placing season for next spring has been generally very unsatisfactory, and at the present time the shoe factories cannot look forward to much activity. There is a general feeling that the worst is over, and that the improvement will show itself after the New Year.

The price trend of raw materials has moved downward very rapidly, and a very considerably lower level has been reached, with supplies easily obtainable. The supply of labor is, generally speaking, plentiful, and the desire to be efficient has greatly improved. Wages are being maintained at the high peak, although probably not over fifty per cent. of full employment has been given in recent months. At present, prices of finished product are on a much lower basis and we feel that deflation of prices has been pretty generally completed.

Nineteen-twenty-one should show general improvement from early in the New Year, and business at times may fairly be expected to be brisk, but we can hardly look for a satisfactory, normal condition to be reached during 1921, it will probably take the whole of this year to put the entire fabric of demand, supply and distribution on a satisfactory basis.

Two Favorable Conditions

By Ontario Shoe Manufacturer

THERE are two outstanding conditions in Canada at present which should be encouraging to every business man.

The first, in our opinion, is the immense amount of food, owing to phenomenal crops of 1920 throughout Canada. The fact that there are assets of this nature in the country at the present time should inspire confidence in the ability of the retailer to pay for any goods which he may purchase. Secondly, recent banking reports indicate savings deposits have increased enormously, thus showing that the purchasing power is in the country at the present time. If consumers could be made to realize that the present slowing-up of production is before long going to result in an actual scarcity of everyday commodities, which will bring higher prices, they would not in our opinion curtail the purchase of their requirements, as they are doing at the present time.

We have every reason to feel, from the standpoint of the boot business, that re-

tail stocks are lower than they have been for many years. Spring sales are much below normal and no fall orders placed to speak of. A large portion of spring orders for 1921 have been cancelled, with the result that many shoe factories in Canada are closed down entirely or reduced very much under their normal capacity. On account of this particular line of business being perhaps the first in Canada to feel the depression, it should be one of the first to recover. The most unfortunate circumstance, however, in connection with present conditions of affairs is the fact that it is necessary to either lay off a large number of mechanics entirely or operate at reduced working hours. In either case, overhead expense cannot be reduced proportionately, so that with the consumers holding off at present, they are to some extent defeating the cheapening of goods, on account of the increased cost of operating plants producing very much under their normal supplies. You will see, therefore, that until these factors are actually brought home to the buying public that necessities are not as plentiful as they imagine them to be, will there be any great change in present conditions. It is much to be regretted that the state of unemployment is going to be necessary in the meantime, but if this is one of the conditions of readjustment, it will have to be faced. All we can say is that we hope the people who are able to buy will not refuse to do so much longer, as those Canadians who depend on normal conditions for a living will have to suffer very much in the meantime.

Public not Overstocked

By Chet. H. Cleveland

J. L. Goodhue & Co., Limited, Danville, P.Q.

IN the early part of 1920 there was a shortage in the supply of raw materials and high prices prevailed up to and including July. Due to the lack of buying since July, markets have not been maintained, and in the absence of general buying, there has been no market.

The efficiency of labor has been below reasonable expectations with wages so high. This condition has shown decided improvement over the past three months with labor more contented and realizing the value of permanent employment.

The average volume of production has been maintained with a too strong tendency to slower payments than prevailed during the first six months of 1920. The price movement on finished products has been downward, particularly in the case of by-products.

Without a conservative estimate of quantities of old stocks of leathers of all kinds on hand, it is more or less guesswork to say whether the process of deflation has been completed. It is conceded that tanners have kept from the market on this account but must sooner or later buy to fill their vats, when prices should advance.

The outlook for 1921, providing the tariff is maintained, is favorable from the fact that the buying public in general is not overstocked. In fact there is a shortage. This must result in increased production for Canadian industry if our home markets are to be supplied with Canadian goods and the dumping of surplus production prevented.

Bottom has been reached

By A. A. Armbrust

The Lady Belle Shoe Co., Limited, Kitchener.

AS to the supply of raw material, there is an apparently sufficient supply of raw stock at the present time, but owing to the tanners not soaking an additional stock, or at least having a small proportion of the usual output should the leather merchant comply with his intention of booking spring orders after the first of the year, it would lead one to think that it would not be very long before this supply is taken up. Easter coming in March, it would appear as if the leather merchant will be compelled to purchase for the holiday trade.

As to the supply of labor; previous to the depression, which we now have, it was not an easy matter to get experienced help, and the average were figuring higher than pre-war. As to efficiency, we do not think there is any one employing labor who feels that he is getting efficiency. The production per man has dropped considerably. We are pleased to report that this has shown somewhat of an improvement, since labor is more plentiful.

As to the present state of employment, we are running possibly fifty per cent. of our capacity. We feel, however, that we will be able to get sufficient help should we require them upon the improvement of business.

As to the state of the market for our goods during the year, up to the depression, we found it very satisfactory, but the shoe business has been practically at a standstill for the last six months. There has been a decided downward movement in prices by the shoe manufacturers, who have marked their prices and produce according to to-day's market value. We believe that we have reached bottom. with the exception of the usual slight ups and downs. In many cases shoes have been sold at prices that cannot be duplicated at to-day's market, due possibly to the requirement of ready cash and unloading regardless of price. The writer feels, however, should there be a sudden rush for goods for immediate shipment, and, as stated, Easter coming at the end of March, the average retailer will have to have some goods for his Easter trade. With the short time available and with disorganized factories and scattered help, it would be impossible to get sufficient output, should we meet with a lot of rush business. This would force the manufacturer on to the leather market, and the writer believes this would have a tendency to stiffen prices.

We think that the matter of export business is almost out of the question, owing to the unfavorable exchange rate.

Past experience has taught us that to anticipate business trends under conditions of present unrest, is practically out of the question. It would appear to the writer that stocks must nearly have reached their lowest level, especially in up-to-date lines. The merchant will be able to satisfy his customer up to a certain limit, with stock he has on his shelves, but we believe that the public will demand the new lines appearing on the market, especially since the American manufacturers are showing many new styles and patterns which are bound to affect the Canadian market.

In talking with a number of the merchants they all seem satisfied with business and agree that they are up to or ahead of last year's business. We do not think that the merchant has had to sacrifice very much. While we think that buying for the year 1921 will be conservative, nevertheless they will have to come into the market shortly. The general buying public have not as yet felt a real hardship, but if the conditions continue and the unemployed are not reinstated, there will not be the necessary funds to purchase and this will have a bearing on the business of the retailer and will react on the manufacturer.

Looking for Good Demand

By Charles Robson

The Robson Leather Co., Limited, Oshawa.

THERE is ample supply of all kinds of raw hides and skins at greatly reduced prices, and we are of the opinion that present-day values have about reached the bottom and that, with an improvement in the demand for leather, which seems almost sure to take place early in the new year, higher prices will be realized for raw stock.

Labor is more plentiful, which naturally tends to increase efficiency. Wages have been extremely high throughout the year. At the present time we are running with a reduced payroll of about fifty per cent.

The demand for leather was extremely brisk during the first half of the year, but gradually fell away during the latter half, due largely to cancellations. Prices of leather have declined in keeping with raw material, but the process of deflation will not be complete until the matter of labor has been adjusted.

Exports of leather from Canada have been very light during the past three months. Foreign houses will soon have to come into the Canadian and United

States markets to replenish their supplies.

Surplus stocks of leather will be pretty well liquidated during the first half of the new year, and we look for a good, healthy and normal demand for leather of all descriptions during 1921. The great curtailment in the production of both leather and shoes that has taken place during the past six months is sure to be felt before another year passes.

Outlook Unsatisfactory

By Hon. E. J. Davis

Davis Leather Company, Limited, Newmarket.

THE supply of raw materials has been satisfactory with prices downward. The labor supply has also been satisfactory and efficient. We are still paying wages at the highest point they were during the war, though we are not employing more than from 50 to 60 per cent. of our average labor.

Business during the first five months of the year was satisfactory, but during the balance of the year little or nothing has been doing either for home or export trade. Prices are now from 50 to 60 per cent. lower than they were at the beginning of the year.

The outlook for 1921 is very unsatisfactory at present. There is nothing in sight to inspire confidence as foreign exchange in European countries is at the lowest point it has reached, with no sign of improvement. We would be only too glad to point out favorable factors as that is what we have been looking for for some months, but there is no use shutting our eyes to conditions which we consider very unfavorable for another year at least.

To Break Deadlock

By T. A. Craig

Wickett and Craig, Limited, Toronto.

THERE is now a plentiful supply of all raw materials used in the tanning industry. Prices of hides are now lower than pre-war, and prices of tanning materials are steadily declining. There has been plenty of labor available during the past year, and efficiency of labor is greater than for several years previous.

At time of writing our industry is almost at a standstill. We are working majority of our men three days a week. Some eight or ten foremen, of course, we keep on full time. The outlook is not bright, but we think the crisis of depression is about over.

The market for our goods during the first six months of 1920 was excellent—from then there was a gradual decline in buying. Prices of all finished products in our line have declined steadily for the past six months. We look for still further deflation of prices. Part of this will develop as a result of readjustment of wage scale and part in smaller margin of profits expected as competition becomes more keen.

At the present time the outlook for 1921 in the leather business is anything but bright. We feel, however, that the difficulty is largely a matter of price readjustments, and we think that heavy retail liquidation after January 1st will break the deadlock.

Review of Conditions in Saddlery Industry During 1920

By JAMES D. TREES

Samuel Trees & Co., Limited, Toronto

NOTWITHSTANDING the strong competition which has developed in the saddlery business, as the result of the introduction of the automobile and motor trucks, there is still a large volume of business to be done in most parts of Canada. Harness makers generally have made a good living during the past season, and the conditions are favorable for a good business in the trade during 1921.

The farming industry, which is the backbone of Canada, has had during 1920 very satisfactory results from its labor, and as the farmers are the principal users of harness and saddlery goods the future of the saddlery business still has many bright spots. Most people fail to realize that we have in Canada to-day over 3½ million horses, most of which are used for work purposes, and also that the proper care of these horses calls for lots of harness, horse blankets and other articles used around a stable.

The introduction of the automobile has made a very popular demand for good roads from all sections of the community, and it has been found that in nearly every case the horses are required to properly do this work. This calls for the use of a great many heavy teams in all parts of the country and it is a class of work which is very hard on harness, so that with the growth of the new roads and the full volume of the programmes which have been already laid out by the provincial governments means a lot of business to the manufacturers of harness.

The rapid development in Northern Ontario, in mining and lumbering as well as the pulp industry, makes a tremendous demand for harness, and as these industries are only in their infancy the harness makers generally are profiting and expect to profit by this enormous development. The principal articles required for the manufacture of harness and saddlery goods are fortunately now almost entirely made in Canada. The three firms which are located in Whitby, Gananoque and St. Catharines, have developed their product to a very high standard and to-day they compare favorably with similar goods made anywhere else, and the result is that they are getting almost entirely all the business in hardware used in the manufacture of harness.

The harness leather tanneries located in Kitchener, Acton, Orillia, and Owen Sound, are capable of turning out a very high-class harness leather, and have absolute control of the Canadian market, so that to-day a Canadian manufacturer of harness has the satisfaction of knowing that he is able to purchase nearly all his supplies from Canadian manufacturers.

Regarding the outlook for 1921, I would say that everything points to a very active demand for team and work harness. The farmers of Canada during the last four or five years have been very conservative in their purchase of harness goods on account of the high price of raw materials and the result is that the manufacturers are looking for the time when the farmer will have to replenish his supply of harness. The Canadian farmer was never in better shape than he is to-day and with the increased development in the different activities mentioned above there is no room for pessimism in the harness business. The development which is bound to come in these basic industries in Canada is going to be a direct benefit to the manufacturer of harness.

There has been a plentiful supply of skilled labor during the year and employees have been well paid, but, unfortunately, during the latter part of the year the demand for harness in some sections of the country has slackened and the result has been that most of the larger factories are only running about 50 per cent. of their men, and the gradual falling market in harness leather is bound to stimulate the demand. As outlined above, the farmers have been waiting for this drop in price before going into the market to buy, but there is no surplus supply of harness on the market to warrant any rapid slump and decline.

The very cold winter of last year had the effect of using up most of the horse blankets in the country, and the result has been that during 1920 there has been a very active demand for horse blankets. This is now a very important department of our business and our mills at Whitby have been running to full capacity throughout the season. Supplies of cotton duck can now be purchased in Canada for the coming season and the Dundee jute mills are busy taking orders for Canadian business, although conditions in Dundee in the jute industry are anything but favorable at the present time.

Summing up, the Canadian manufacturers of harness have had a comparatively active season, and are looking forward to a fair business during 1921.

FOOD PRODUCTS INDUSTRY

Has Been Acute Adjustment

By E. C. Fox

William Davies Co., Limited, Toronto.

THE number of live stock in Canada for this year, both of hogs and cattle, shows a great shrinkage as against a year ago. Consequently, there has been a demand larger than the supply. Until recently, prices have ruled very high but, with the decline in the price of grains to a more natural level than they have been for the past two years, the price of hogs has had to decline to that level.

The year 1920 and the first half of 1921 will probably register the most acute shortage of live stock that Canada has had for a number of years, but I look for improvement during the last half of 1921, due to the excellent crop this year and to the fact that it is more profitable for the farmer to manufacture his rough grains in the form of live stock than to sell them on the open market.

The packing industry has gone through a very acute adjustment the last twelve months. Many of the raw commodities directly and indirectly associated with the packing industry have reached almost pre-war levels. For example, hides dropped from a high point of 60 cents a pound in 1919, to as low as 15 cents for this year. Wool has come down from unprecedented levels to a pre-war basis with still little demand. Fats, both animal and vegetable, have declined dramatically and are almost on a pre-war basis. Grains have had their full share. Declines in cotton and sugar have affected the packing industry also.

These declines in primary commodities must have their effect upon all industry. They have affected immediately those industries that are directly connected with the production of these commodities, but the next few months will see them affect all other industry and this will be hurried by the strained credit situation over the whole world.
